It has been observed that the strategies which include direct instruction on articulation placement, such as phonetic change, cloze procedure with phonemic cues, and/or think aloud in phonemic awareness, appear to be more appropriate for promoting positive changes in articulation in children with higher levels of severity of compensatory errors, such as those who can only articulate correctly when they produce isolated phonemes or used them in words or short phrases with constant support of the clinician. When these strategies were compared with those that do not include direct instruction such as modeling or modeling with stress, a significant difference was observed. However, these last two strategies showed similar effectiveness in the lowest level of severity of articulation (inconsistent). In this level, children are more aware of the use of speech sounds, and show confidence for producing these sounds during a more structured discourse. It is important to emphasize that modeling is one of the most frequent strategies described. [12, 20] Also, the two strategies which include modeling, I. e. modeling and modeling with stress, are the most common strategies used by speech pathologists in these children. Nonetheless, these strategies do not seem to be as appropriate as the ones that include direct instruction when there are severe articulation errors. It seems that the clinician should consider the characteristics as well as the degree or level of severity of the articulation impairment before deciding which strategies should be used. It should be pointed out that these strategies can be used at any time during the intervention period.

No additional procedures or studies are necessary for incorporating their use during routine speech therapy sessions. Of course, there are several other strategies which are frequently used for providing speech therapy in children with cleft palate. Also, specific methodologies and procedures have been described in the related scientific literature, reporting successful outcomes. Good results have been reported using drills with a focus on frequent and rapid repetition, frequency of therapy and frequently reinforcement at home several times a day. [7]

Speech intervention for children with cleft palate and compensatory articulation errors should be provided by addressing articulation directly but always within a linguistic context. It has been reported that besides the expected speech disorders in children with cleft palate some of these patients can show language impairment. [27] It has also been reported that low educational level of parents and limited social and economic resources are related with an increased frequency of language impairment. [28]

For the speech intervention, different activities can be implemented in order to facilitate changes in the articulatory system of each child. Some of them had a structured context such

as storybook reading/ telling where the text or illustrations provide concrete information with visual cues to refer to. Also, talking about a graphic organizer can be considered a structured and present context. In contrast, communicating during symbolic play situations in which the context or situation for playing has to be created with words, or talking about a non-present situation, are considered less structured linguistic contexts or events, since there are no visual cues supporting communication. In these instances, the individual has to create the whole context through language (decontextualized situation).

When the positive changes in articulation elicited by the use of the strategies mentioned herein, is compared in more structured and less structured contexts, there seems to be similar positive changes in both situations. Nonetheless, when the strategies that do not include direct instruction on articulation such as modeling, or modeling with stress have been assessed, there seems to be a tendency for more positive changes when the strategies are used in more structured contexts, such as storybook reading/telling. This finding can be explained since these structured situations can provide more contextual or concrete support for communication. This can be especially relevant for the higher levels of severity of compensatory errors and speech pathologists can take this into consideration when they are planning the intervention. When children with articulation errors are treated, providing visual support is valuable tool for scaffolding.

The speech pathologist must have clear goals for each patient for optimizing speech intervention. Considering which strategy could be more appropriate for each patient depending on their specific needs, such as the severity of compensatory errors can improve the results of intervention. Improving speech outcome is extremely relevant for the child's integral development and final result.

Total time of speech intervention necessary for correcting children compensatory articulation errors associated with cleft palate is reduced when the intervention is conducted based upon phonological principles and the strategies to be used during the intervention are selected according to the severity of the errors in each child. In an approach based upon phonological principles, errors are considered to be linguistically based and are attacked at the rule level, rather than at the phonetic level.

Articulation disorders in children with cleft palate have been extensively described from a phonetic or peripheral stand point. [7, 8, 9] Most authors report that these children have articulation abilities below age expectations. Only a few studies have focused on the phonologic disabilities of these children. [14, 22] It seems that some of the speech sound problems present in cleft palate children are phonologic in nature. Chapman in 1993 [3] studied the phonologic processes in children with cleft palate and found that children with cleft palate exhibit early delays in phonologic development. This finding has implications for the assessment and management of children with cleft palate, including analysis of phonologic processes in addition to phonetic analysis. It also implies that during speech intervention, remediation strategies based on phonological principles should be employed. Also, these strategies should emphasize cognitive-linguistic activities and the selection of the strategies to be used in each child should be selected according to the severity of the articulation errors in that particular child.

The reduction in the total time of speech intervention necessary for complete correction of compensatory errors when an approach based upon phonological principles is used suggests that the study of the phonologic system in these patients is of great importance.

As mentioned herein, the treatment for compensatory articulation disorder in cleft palate patients has traditionally focused on the phonetic level. However, higher organizational levels of language are usually not considered. An approach based upon phonological principles considers speech sound production as an integral component of higher levels of language organization such as pragmatic, syntactic, and semantic knowledge. Also, phonological treatments acknowledge that speech sounds function as phonemes that signify differences in word meaning, and have become more cognitive and meaning-based than traditional treatments which practice execution of gestures in meaningless syllables. [3, 4, 13, 14, 15, 18]

The final goal of a speech pathology intervention is to improve intelligibility of speech but the methods and strategies used for achieving this objective can be varied.

CONCLUSION

This chapter describes some strategies to be used in speech pathology interventions for children with cleft palate and compensatory articulation errors. An intervention including these strategies is more phonological than phonetic, that is, it considers not only the peripheral aspect of articulation but higher levels of linguistic organization. Also, considering which strategy could be more effective for each patient depending on his or her specific needs, such as the severity of the articulation errors, could be a valuable procedure for improving outcome in speech therapy intervention in these children.

Chapter 34

A REVIEW OF MAJOR STRANDS IN DISCOURSE ANALYSIS IN LANGUAGE TEACHING

Dogan Yuksel* and Banu Inan[†]

Kocaeli University, Faculty of Education,
ELT Department, Turkey

ABSTRACT

This chapter reviews major perspectives towards discourse analysis in foreign and/or second language learning and teaching settings. Three major strands that have been examined are Critical Discourse Analysis, Interactionist Discourse Analysis and Sociocultural Discourse Analysis. Each perspective is reviewed by providing the major characteristics of the perspectives and some sample studies. One or two most current studies that are published in major journals of our field have been added to the reviews as well.

INTRODUCTION

In its most general definition, “discourse analysis” is the study of language-in-use, which includes written texts and spoken data. The word “discourse” comes from Latin “discursus”, which means “conversation, speech”. Discourse analysis aims to study language beyond sentence level, it connects linguistic behaviour to social practices or it considers language as a system of thought. The idea behind discourse is unity and coherence. In other words, “within a discourse, multiple sentences or propositions logically follow each other (VanPatten & Benati, 2010, p. 81). In this sense, Stubbs (1983, p.1) defines discourse analysis as:

- concerned with language use beyond the boundaries of a sentence/utterance,
- concerned with the interrelationships between language and society
- concerned with the interactive or dialogic properties of everyday communication

[†] Corresponding Author Email: banu_inan@yahoo.com.

In the explanation of this phenomenon related to language and society, what is taken into account is the interrelated issues associated with social and historical context and participants. There are different conceptualizations of discourse. VanPatten and Benati (2010) state that a discourse can be “a short interaction, an entire conversation, a written paragraph, a speech, and so on” (p. 81).

McCarthy (1991) suggests that different disciplines and their changing popularity have contributed to the appearance of “discourse analysis” throughout the time such as semiotics, psychology, anthropology, and sociology. Perhaps one of the most important fields that formed the basis for discourse analysis was linguistics. As an important part of the study of language, separate sentences were analyzed for several different reasons such as to identify the relationships between the elements in a sentence and to describe the components of sentences in terms of phonology, morphology and syntax. However, the social aspect was not taken into consideration until Austin (1962), Hymes (1964), Searle (1969), Halliday (1973), and Grice (1975) started to highlight the social and pragmatic functions of sentences and their changing meanings in accordance with context.

In this chapter, we will be examining how discourse has been used and studied in second and/or foreign language learning and/or teaching settings. In other words, we will be dealing with the concept of ‘pedagogical discourse’, as it was conceptualized in previous studies. There are different perspectives toward the study of discourse and we will be focusing on the major trends in discourse analysis in the field of second language learning. Each sub-section of this chapter will be devoted to a perspective of discourse analysis. The three major perspectives towards discourse that have been investigated are a) Critical Discourse Analysis, b) Interactionist Discourse Analysis, c) Sociocultural Discourse Analysis. Here, we have to acknowledge that there are different understandings of discourse that might be beyond the scope of this chapter (e.g., analysis of written discourse, (for a detailed review of written discourse analysis, one can refer to Ferris (2011) or different classifications of the perspectives that we were unable to discuss here. There might be even sub-classifications of these categories or different approaches within these traditions (e.g., see Wodak and Meyer (2009) for a detailed analysis of Critical Discourse Analysis and its subcategories). Because of the scope of this chapter, we are not going to examine these issues.

CRITICAL DISCOURSE ANALYSIS

In the Handbook of Discourse Analysis edited by Schiffrin, Tannen and Hamilton (2003), Van Dijk (2003) defines Critical Discourse Analysis (CDA) as “a type of discourse analytical research that primarily studies the way social power abuse, dominance, and inequality are enacted, reproduced, and resisted by text and talk in the social and political context” (p. 352). Even though its traces can be found in the critical theory of the Frankfurt School before the Second World War, in the field of second and/or foreign language, the launch of Van Dijk’s journal “Discourse and Society” in 1990 and simultaneous publication of some other books in our field mark the beginning of CDA. Van Tjik positions CDA differently among other perspectives towards discourse by stating “CDA is not so much a direction, school, or specialization next to the many other *approaches* in discourse studies. Rather, it aims to offer

a different *mode* or *perspective* of theorizing, analysis, and application throughout the whole field” (p. 352, original emphasis).

Main tenets of CDA as summarized by Fairclough and Wodak (1997, pp. 271-80) as cited in Van Dijk (2003) are as follows:

- CDA addresses social problems
- Power relations are discursive
- Discourse constitutes society and culture
- Discourse does ideological work
- Discourse is historical
- The link between text and society is mediated
- Discourse analysis is interpretative and explanatory
- Discourse is a form of social action.

Since CDA is regarded as a multi- directional mode or perspective, following these general tenets, there might be many different types of CDA, and they may be theoretically and analytically quite diverse. As a general understanding of discourse from a CDA perspective, language is regarded as *a social practice* and *context* is the heart of the analysis of language and discourse (Fairclough & Wodak, 1997). The following popular quotation by Fairclough & Wodak summarizes the general conceptualization of discourse from a CDA perspective:

Describing discourse as social practice implies a dialectical relationship between a particular discursive event and the situation(s), institution(s) and social structure(s), which frame it: The discursive event is shaped by them, but it also shapes them. That is, discourse is socially constitutive as well as socially conditioned – it constitutes situations, objects of knowledge, and the social identities of and relationships between people and groups of people. It is constitutive both in the sense that it helps to sustain and reproduce the social status quo, and in the sense that it contributes to transforming it. Since discourse is so socially consequential, it gives rise to important issues of power. Discursive practices may have major ideological effects – that is, they can help produce and reproduce unequal power relations between (for instance) social classes, women and men, and ethnic/cultural majorities and minorities through the ways in which they represent things and position people. (Fairclough and Wodak, 1997, p. 258)

To investigate how discourse has been studied from a CDA perspective, we provided one of the most recent works that has been published in a major journal of our field. In this study, Vasconcelos (2013) investigates a dialogic speech event that took place in an ESOL (English for Speakers of Other Languages) class in the southeastern United States. To critically examine the discourse, she used Fairclough’s (1992) “moment of crisis” notion where pieces of evidence regarding the communication problems and necessity of repair portrayed. Specifically, her analysis demonstrated the problematization of the concept of what it means to “be American.” By providing a step-by-step critical discourse analysis of the structure of a dialogic speech event, Vasconcelos offers a contribution that examines, and models dialogic practices associated with preparing ESOL pre-service teachers.

In Vasconcelos’s (2013) study, a series of sequential components make up the moment of crisis. To identify this moment of crisis, she uses the linguistic (verbal and nonverbal) features of the utterances as well as their place and function in the speech event. Following definitions of the different components of a moment of crisis taken from Fairclough (1992) might help us how a discursive event is analyzed critically.

Table 1. Structure of the moment of crisis

Moment of Crisis	
Trigger	Any linguistic action that precipitates a linguistic reaction
Onset	The linguistic response to the trigger; the onset characterizes the moment of crisis because it suggests misunderstanding in the speech event
Development	The linguistic chain following the onset and building up to the pre-climax
Pre-climax	A linguistic unit that leads up to the climax
Climax	A linguistic unit that indicates a decisive moment of maximum intensity because it exposes the reason for the misunderstanding
Resolution	A linguistic unit that indicates that the misunderstanding has been clarified and worked out (the resolution characterizes a moment of crisis as a dialogic speech event)
Coda	A linguistic unit that serves to round out or conclude the speech event

INTERACTIONIST DISCOURSE ANALYSIS

In the field of second and/or foreign language learning, interaction broadly refers to “conversations between learners and others, and the Interaction Hypothesis focuses on how such interactions might affect acquisition” (VanPatten & Benati, 2010, p. 99). One of the main grounds of Interaction Hypothesis is that interaction that entails negotiation of meaning and feedback facilitates second language acquisition (Gass et al., 2005). A group of scholars (Gass, 1997; Long, 1996; Pica, 1994) argue that implicit negative feedback, which can be obtained through negotiated interaction, facilitates second language acquisition. In parallel terms, Loewen & Erlam (2006) state that instances that promote and facilitate acquisition are created when learners are provided with opportunities to interact with each other to obtain comprehensible input and feedback, and to reformulate their own utterances.

The earlier traces of Interactional Hypothesis can be found in the works of Hatch (1978). However, as an intact theory, Interactional Hypothesis was first formulated and later modified by Long (1980; 1983 & 1996, respectively). Emphasizing the inadequacy of Krashen’s Input hypothesis by saying that “comprehensible input”, by itself, is not enough unless learners produce language by means of interaction, Long (1996) argues that “negotiation for meaning,

especially negotiation that triggers interactional adjustments by the NS or more competent interlocutor, facilitates acquisition because it connects input, internal learner capacities, particularly selective attention, and output in productive way” (452). Thus far, many studies reported that interaction created instances that could facilitate second language development (Ellis & He, 1999; Mackey, 1999; Varonis & Gass, 1985).

In her comprehensive review of the studies that follow an interactionist perspective, Pica (1998) claims that negotiation:

- assists comprehension
- brings salience to form-meaning relationships
- creates opportunities for learners to receive useful feedback from their interlocutors
- provides a context for the learners to use the kind of feedback that could produce modified output
- provides a context for the learners to think about syntax.

Most of the earlier studies on interaction focused on modified interaction with the ideas proposed by Long (1983) which suggest that modified interaction is the necessary mechanism for making language comprehensible. An example of how modified interaction can facilitate second language development is provided in Mackey (1999). In the excerpt X taken from Mackey (p. 558-559) the NNS does not understand the word *glasses*. The word is repeated by the native speaker (NS), the original phrase is extended and rephrased, and finally a synonym is given.

Table 2.

NS	<i>There's there's a a pair of reading glasses above the plant</i>
NNS	<i>A what?</i>
NS	<i>Glasses reading glasses to see the newspaper?</i>
NNS	<i>Glassi?</i>
NS	<i>You wear them to see with, if you can't see. Reading glasses.</i>
NNS	<i>Ahh ahh glasses glasses to read you say reading glasses.</i>
NS	<i>Yeah.</i>

To investigate how discourse has been studied from an interactionist perspective, we examined a recent study by Sato and Lyster (2012). In their quasi-experimental study, Sato and Lyster aim to investigate the effects of (a) teaching learners how to provide corrective feedback during peer interaction and (b) assessing the effects of peer interaction and corrective feedback on second language development. The findings of their study revealed that peer interaction offers opportunities for repeated production practice and might facilitate proceduralization, however corrective feedback sharpens the learners' ability to monitor both their own language production and that of their interlocutors.

SOCIOCULTURAL DISCOURSE ANALYSIS

As an alternative to mainstream interactionist perspective of second language acquisition, Vygotskian Sociocultural theory of mind has been presented in second and foreign language learning and teaching contexts. It claims to offer a promising perspective by widening the scope of language study. Lantolf (2000) argues that the implications inspired by Vygotsky “lead to a view of learning and teaching which in many respects is very different from theories currently in favor in the mainstream second language acquisition (SLA) literature” (p. 1). Most of the works on Vygotsky’s Sociocultural theory (1978; 1986) focus on discourse as well, and they claim that “more is happening in discussions than what can be surmised by the accumulated meanings of the spoken words” (Wortham 2000, p. 38). Studies that follow the Sociocultural perspective criticize those of the Interactionist perspectives by stating “interactive negotiation through individual input and output modifications does not provide sufficient conditions for acquisition and mastery of a second language” (Lee, 2004; p. 84). Quite contrary, they believe that “language learning goes beyond *what* the individual produces (e.g., input and output) and focuses on *how* the individual interacts with others through a joint activity (e.g., collaborative online exchange). (Lee, 2004; p. 84, original emphasis).

Ohta (1995) argues that research that follows Sociocultural theory in second and/or foreign language settings “examines the dynamic relationship between interaction and acquisition, exploring how language, cognition, and culture are acquired through collaborative interaction” (p. 93). In her study, while analyzing the discourse, she portrays “the learner-learner collaborative activity between two students of differing levels of proficiency to result in creative interaction where scaffolding creates a positive environment for L2 acquisition” (p. 93). The collaborative interaction which includes the contributions of learner strengths and weaknesses results in refinement of both learners’ second language use, which is explained by the concept of zone of proximal development (ZPD).

In another recent work, van Compernelle and Kingenger (2013) examine how learners interact in so-called cooperative interaction environments while they are working on a questionnaire. Following dynamic assessment principles, cooperative interaction reveals both fully formed and emerging competencies (i.e., zone of proximal development) while at the same time furthering their continued growth. This study draws on data collected during a concept-based pedagogical enrichment program in which US university students of French were learning the concepts of social distance and power hierarchies as illustrated by the second-person pronouns **tu** and **vous** ‘you’. The case study of one learner, Nikki, to show how support provided by a tutor around one questionnaire item both assessed and promoted her developing conceptual knowledge about the dynamics of interpersonal relationships and how these are indexed through language are presented in this study.

In another study, Moore (2013) examines the contextual features surrounding the use of a first language (L1) in a Japanese university during peer interaction in the extended preparation phase. Interaction data were analyzed in terms of the amount of L1 production, the distribution of L1 use within and across tasks and dyads, and the focus of learner talk. Contextual influences on L1 use were also investigated. Within dyads, learners generally used less L1 over time. This was attributed to the shifting focus of talk from procedural to content - creation activity. Some learners were consistently high or low users of L1, while

others varied. Variability was attributed to differences in second language (L2) proficiency, levels of engagement with the task and/or interlocutor, and the negotiation of task control and pedagogic roles within a dyad. Finally, it was found that the language chosen for the initial utterance of an exchange may influence that of following utterances. The results support the contention that L1 use emerges naturally in classroom discourse and that attempts to influence it should involve raising awareness of contextual conditions surrounding its emergence.

CONCLUSION

As reiterated in many other works, the importance of the examining the discourse was acknowledged by many researchers in different fields of education (Cazden, 2001; Gutierrez, 1994; Lemke, 1990; Nystrand, 1997; Walsh, 2006; Wells 1999). In this chapter, we have examined how discourse has been used and studied in second and/or foreign language learning and/or teaching settings by reviewing three current approaches towards discourse analysis: a) Critical Discourse Analysis, b) Interactionist Discourse Analysis, c) Sociocultural Discourse Analysis.

Chapter 35

ISSUES ABOUT CONDUCTING DISCOURSE ANALYSIS RESEARCH

Dogan Yuksel^{1,*} and İhsan Unaldi^{2,†}

ABSTRACT

The main aim of this chapter is to help novice researchers gain some insights about conducting a discourse analysis research study. We mostly refer our previous experiences and discuss some issues that might facilitate the research process. We have divided this section into three sections. The first section, before data collection, discusses some issues to be done prior to the data collection process. During data collection mainly deals with how to record the data and obtain any other necessary information. The final section focuses on topics such as data transcription, data indexing, data reduction, coding and interrater reliability. Illustrations and samples are given whenever necessary. The chapter also includes a sample of Consent Form.

INTRODUCTION

In this chapter, we will discuss some methodological issues about conducting a classroom interactional analysis study for novice researchers by mostly referring to our previous research experiences. We will also be referring to quantitative research designs and their applications in discourse analysis but most of the ideas discussed here are about a qualitative conceptualization of a discourse analysis approach.

Most of the studies that analyze the interaction in the classroom employ a discourse analysis approach. Discourse analysis can be briefly defined as “the study of spoken and written texts” (Walsh, 2006, p.81). It mainly deals with the functions of the words and phrases in their context. However, due to its common use with different conceptualizations, it is difficult to have a clear-cut definition of Discourse Analysis. Starting from the very early studies of discourse analysis by Sinclair and Coulthard (1975), as Seedhouse (2004) asserts, majority of the studies that focused on classroom interaction “have implicitly or explicitly adopted ... a discourse analysis approach” (p. 81). Different methodological and theoretical orientations of these studies are discussed in Chapter 2. In this chapter, we will mainly deal with some practical challenges that one might encounter while conducting a study on classroom interaction.

We have divided this chapter into three sections. The first section, before data collection, will include some steps to be taken prior to data collection. These basic decisions will shape the research process therefore they have a pivotal role in the development of the research and in its later phases. In the second part, we will talk about some caveats that should be kept in mind during data collection. These important steps will facilitate the proper administration of the data analysis section. Finally, a big portion of this chapter will be devoted to after data collection phase where the mechanics of data transcription and coding will be thoroughly discussed.

BEFORE DATA COLLECTION

The heart of the research will be the research question(s), and their choice will impact the research method, data collection, analysis and coding tools. As Mackey and Gass (2005) state, “the first and perhaps one of the most difficult aspects of any research undertaking is the identification of appropriate research questions” (p. 16). Due to its significance, one should be really careful while conceptualizing and wording the research question(s). The research question should also guide the steps of your research. For many novice researchers, generating research questions is a difficult task. These questions should be interesting, current, answerable, and they should aim to address gaps in the existing literature.

Choosing the research methods (qualitative vs. quantitative) and tools (observation, videorecording, audiorecording) of data collection will be the second important step of the research process. The research questions will guide the choice of qualitative or quantitative research design which will eventually impact the choice of the participants. Most quantitative research would require random selection or distribution of the participants, on the other hand in most qualitative studies; the researchers tend to use purposeful sampling rather than random (Ellis & Barkhuizen 2005). For more information about research design, tools and sampling in discourse analysis, one can refer to Mackey and Gass (2005) and Ellis and Barkhuizen (2005).

Choosing the Research Site

Most of the research settings would require some form of permission to get access to their sites. In some situations getting the approval of the Institutional Review Boards (IRB) or Human Subjects Committee would be necessary to conduct research, in some other cases, obtaining the approval of the Managers or Supervisors of the programs would be enough. In some other settings both of these might be needed before starting the data collection. After getting all these approvals, signed consent forms of the participants will be necessary as well. These forms are usually translated into the first languages of the participants. A sample Consent Form is provided in the Appendix.

DURING DATA COLLECTION

Most of the discourse analysis research would entail some form of recording and/or observation. Walsh (2006) lists four basic choices of data recording: audiorecording, videorecording, observation and narrative. The choice of type of the recording would depend on the nature of the study and questions asked. As Walsh states, audiorecordings are the most convenient means of recording commonly used to capture interaction in classrooms. On the other hand, videorecording would provide visual images of the participants, if that type of information is necessary. They would also help the researcher identify the turns and names of the speakers which might be quite problematic sometimes due to the quality of the audiorecording devices used.

Most of the audio or videorecording sessions are complemented with field notes taken as a non-participant observer in the classroom settings. The main aim of using multiple data collection techniques is getting various perspectives of the same classroom phenomenon to increase the credibility of the study. Fieldnotes usually involve detailed impressions of the researcher's intuitions, impression, and questions as they emerge. Audio and video recording help the researcher analyze language use in greater depth later and involve outside researchers in the consideration of the data (Mackey & Gass 2005). With the help of video and audio recordings, almost all of the interaction in the classroom can be available for analysis, and this enables the researcher to focus on other dynamics in the classroom during observation while taking fieldnotes.

We should also keep in mind that, as Evertson and Green (1986) state, the purpose of the observation influences what is observed, and how observations are recorded and analyzed. The research questions and theoretical framework should shape the nature of the observations and how data are collected and analyzed.

One caveat we should keep in mind is the first day of recording. On the first recording, some participants might not reflect their ordinary performance because of the presence of the camcorder and/or researcher. Yuksel (2007) reflected the fact that the participants were not comfortable and the uneasiness could also be observed in the transcripts of Week One in his research. However, in coming weeks, the uneasiness faded slowly.

Secondary Data Sources

If necessary, secondary data can be collected as well. List of the secondary resources would include, but not limited to, background survey, exam questions, course syllabus, other course related documents, information about the setting obtained from online sources and interview data. These secondary sources can provide some additional information that would not be available through observation or interviewing. For example, the background questionnaire can include some extra information about the students, and their prior English learning experiences. Similarly, exam questions might reveal some insights regarding what is important to know, in other words, what is needed to be learned from that course. Even though most of the information obtained through secondary data sources may not be directly related to the questions in hand, they might still provide some insights to the researcher.

AFTER DATA COLLECTION

The most obvious feeling in discourse analysis studies after data collection for the novice researcher is the feeling of being lost in a vast ocean of data. Once, s/he gets over that feeling, s/he starts the post data collection phase of the study which would include data transcription, data indexing, data reduction and data coding.

Data Transcription

Data transcription is one of the most tedious stages of discourse analysis. The researcher can transcribe the data themselves or get some help during this process. During the transcription process, one can also plan to use a professional voice recognition software to help them write the conversation down. In the market, different commercial software is available. For a review of some voice recognition tools, you can refer to Honeycutt (2003). For data transcription, there are also some facilitative tools. SoundScriber is one of these media players that aids in transcription of digitized sound files and is available for free under the GNU General Public License. SoundScriber includes special features for transcription besides normal playback features such as those offered by the accessory Media Player (Play, FF, Rew, Pause). More information about SoundScriber can be reached at the following URL <http://www-personal.umich.edu/~ebreck/sscriber.html>.

Data Indexing

Data indexing involves describing the context in which the data occurred (Jacob, 1987 as cited in McCormick, 1997), in other words, where and when the activity took place in the study. As a researcher, one might need to identify the general themes of each recording session (e.g., task, activity or lesson) and give some sub-headings to the transcripts.

The Case of Crushed Petunias

Major activity: Background information		
Tragedies and Comedies (12.55-14.05) (1.1.2)		
01	T	So the English actors performed Shakespearean plays. Why? Tragedies or comedies by the way? Shakespeare comedies and Shakespeare tragedies, which ones?
02	S1	Tragedies
03	T	Tragedies, very good (++) why? Not comedies, but tragedies. Because, the aim is to--- according to the new land--- the aim must be to show the universal truth. So which one lends itself to the universal truth, tragedies or comedies?

Figure 1. An example of indexed transcript.

Data analysis is a recursive process, and the researcher needs to do data indexing and data reduction quite frequently on different occasions while dealing with the data.

Data Reduction

As Ellis and Barkhuizen (2005) recognize, data reduction is an essential and welcome process in qualitative research. Data reduction can take the form of coding, summarizing, paraphrasing, focusing, writing memos and indexing. Miles and Huberman (1984) state that data reduction can occur before, during, as well as, after data collection. Data reduction for the qualitative studies will be extremely important due to the vast amount of data. Based on our research focus and questions we can locate the sections of our data and analyse those according to our research agenda. Here, we can use the definitions and operationalization based on previous literature. After analyzing our own data, we can fine-tune or revise our classifications.

Data Coding

Coding is one of the frequently employed techniques in qualitative research. It refers to “organizing data into themes and categories so that they can be used for the purposes of ongoing analysis, interpretation and conclusion drawing” (Ellis & Barkhuizen, 2005, p. 253). In practice, coding involves attributing codes to units of data that represent the themes and categories either previously determined or that emerge from the data during analysis.

While coding and analyzing the data, deductive or inductive approaches can be used (Ellis & Barkhuizen, 2005). With top-down deductive coding, the analyst begins with a set of codes created before engagement with data begins. With bottom-up inductive coding, the codes emerge as the analyst examines the data. We can also use a combination of these techniques where we might have a tentative list of codes which take its final form after examining the data. Choice of the codes and constructs is usually motivated by the previous literature and the theoretical framework of the study. We should specifically prepare coding manuals that will guide us during coding as it will also help us during interrater reliability process. A sample coded episode is provided in Figure 2.

We should also prepare a Transcription Key that will help our readers understand the main conventions we use in our transcription. This reader-friendly manual will also help our external rater while coding our data. A sample Transcription Key is provided in Table 1.

Name of the episode – duration- number			Our Town	Name of the play
Typical Day (10.05- 24.28) (5.1.1)			Fifth week, first lesson, first episode	
01	T	Let's talk about Our Town and main theme of Our Town. Before starting, shall we talk about our own culture? {TQ-N} In your daily life, suppose you are teenagers and you are in secondary high school and you wake up. Could you please tell me your daily life in a Turkish culture? You wake up and what do you do? {TQ-A}		
02	SS	Breakfast {U-W} {REVOICING}		
03	T	Yes, you have breakfast. Who prepares breakfast? You? Your mother? {TQ-A}		
04	Si	My mother {U-P} {REVOICING}		
05	T	Wonderful, what else? {TQ-A} Your mother prepares and does she say you something while you are eating? {TQ-A}		
06	SS	Eat quickly {U-P}	Participants' names	
07	T	Eat quickly		
08	Fe	Drink {U-W}		
09	T	Drink quickly, finish quickly, what else? {TQ-A}		
10	Nu	Eat all of them {U-P}		
11	T	Eat all of them, wonderful. Don't leave anything on the plate, wonderful. Hakan, what does your mother tell you while you are eating? Nothing? {TQ-A}		
12	Ha	The same things {U-P}		
13	T	What is the same thing? {TQ-N}		
14	Ha	Finish all of them, don't leave anything. {U-S}		
15	T	Don't leave anything on the plate, finish everything.		
16	Fe	I was drinking milk and mom says don't pour it. {U-S}		
17	T	Don't pour it. Drink it, very good, wonderful. So you are pouring milk, you don't drink milk.		
18	Fe	Yes, I don't like it. {U-S}		
19	Ha	If she is (++) she is busy sometimes she wants me to collect to (++) err (++) to collect the meals (+) the plate {U-S}		
20	T	Clear the table		
21	Ha	Yes, clear the table. {U-P} {UPTAKE} {REVOICING}		
22	T	So, you clear the table.		
23	Ha	Yes {U-W}		
24	T	Very good, how do you clear the table? On the floor? {TQ-A}		
25	Ha	No {U-W}	Number of turns	
26	T	To the right place? {TQ-A}		
27	Ha	Yes {U-W}		
28	T	Right places, very good, Ok please Buket, I am looking at the slim students I am sure your parents are reminding you to eat more. (++) No? {TQ-N}		
29	Bu	My family don't {U-P}		

Figure 2. An example of color-coded episode.

Table 1. A sample transcription key

Symbol	Meaning
T	Teacher Turns
Nu, Es, Fe, Er...	Identified Student Turns
S1, S2, S3, S4	Unidentified Student Turns
[]	Extra Information
(+)	Pause (number of '+' indicates the seconds)
[	Overlapping speech
]	
[Tr.] [Fr.] [Ch.]	Utterances in Turkish, French, Chinese

Interrater Reliability

Interrater reliability is an important part of classroom discourse research. After the researcher(s) codes their data, usually external raters are asked to code some portions of the data. Researchers usually randomly select 10-20% of their data. In his study, Yuksel (2007) used a website (e.g., www.random.org) that generated random numbers. Random.org provides true random numbers through the Internet. The website claims that all numbers are tested statistically and the results are available in real-time.

After randomly selecting some portions of the data, a training manual that includes the definitions of each construct together with at least two examples can be used to help external raters. After the raters read the training manual, they can meet with the researcher and discuss some problematic issues. Usually correlation percentages are given in studies by using a score of Cronbach Alpha which is a coefficient of internal consistency.

CONCLUSION

In this chapter, we have reviewed some practical challenges about conducting a classroom interactional analysis study for novice researchers by mostly referring to our previous research experiences with the inspiration that this rough guideline will help budding researchers be more familiar with the basics of a discourse study. One should also keep in mind that some of the suggestions put forward here might not be applicable to different conceptualizations of discourse analysis approach.

APPENDIX

LETTER OF INFORMED CONSENT

Dear student:

I am a graduate student under the direction of Dr. Deborah J. Hasson in the Department of Middle and Secondary Education of the College of Education at Florida State University. I am doing a research study about the nature of the discourse in a literature class in English Education department in your institution and I would like you to take part in this study.

The study will be done in your classroom during the regular class hours. I will place a video camera and tape recorder in the classroom and I will be observing and taking fieldnotes during this period.

There are no foreseeable risks or discomforts if you agree to participate in this study. You will participate only if you want to. Your participation will not in any way affect your evaluation at the end of the session. You have the right to withdraw from the study. The information obtained during the course of the study will remain confidential to the extent allowed by law. The results of this study may not be used anywhere other than my dissertation and your name will not be used.

By participating in this study you will be giving researchers and educators valuable information on the nature of discourse in literature classes at the college level. In addition to that, this study can serve to improve instructional methodology and the nature of teaching in literature based classrooms to make them more learner centered.

If you have any questions concerning the study, please call me at (262) 646 9824 or e-mail me at doganyuksel@yahoo.com. You may reach Prof. Dr. [redacted] or by e-mail [redacted]@[redacted].tr. If you have further questions regarding your rights as a participant in this research you can contact the Human Subjects Committee Instructional Review Board at (001 850) 644-8633 or by email (phaire@mailers.fsu.edu).

Sincerely,
Dogan Yuksel

I agree to participate in this study. I understand that I will be tape recorded and videotaped by the researcher. These tapes will be kept by the researcher in a locked filing cabinet at researcher's house. I understand that only the researcher and his professors will have access to these tapes and that they will be destroyed by 31 May 2015.

Chapter 36

CORPUS LINGUISTICS AND DISCOURSE STUDIES

Ihsan Unaldi*

University of Gaziantep, Faculty of Education, ELT Department, Turkey

ABSTRACT

Discourse studies mainly try to go beyond sentence boundaries and analyze natural language in use. The context where written, spoken or any kind of semiotic event take place is a major concern in discourse analysis. Corpus linguistics is also related to the real language in use by making analyses of large collections of written or spoken language samples. Apart from corpus linguistics' being more of a methodology rather than a discipline per se, the main difference between the two is that while structural and lexical patterns are in the foreground in corpus linguistics, discourse analysis embraces the idea that there is more than meets the eye in the real language in use. In this chapter, possibilities of integrating corpus methodology into discourse studies are sought.

INTRODUCTION

Looking for patterns is innate in human conscious. When we ponder what we really mean by referring to something as *meaningful*, we might realize that we are actually saying '*There is a pattern there*'. In terms of language in use, this is something we naturally do without noticing most of the time. When people are discoursing, they are actually creating or revealing patterns, or they are trying to *catch* patterns created by other interlocutors. Once we catch these patterns in a conversation, we enjoy a good chat with friends; otherwise, we seem to fall short of the *meaning* we always expect.

The term discourse analysis has been in use since the beginning of the second half of the twentieth century and is directly related to the nature of written or spoken registers where contexts, purposes, interlocutors or outcomes are bound to emerge. Concepts which are beyond the language in use like conversational rules (spoken register) or the contextual functions and structures of a text (written register) are all in the domain of discourse analysis.

* Corresponding Author Email: ihsanunaldi@gmail.com.

On the other hand, corpus linguistics came into being through the need to understand the patterns in ecclesiastical texts that we might have been missing. These texts sure didn't lack any context or purpose, but the scholars had to go the extra mile for a deeper understanding; they were searching for patterns in these texts.

As one might guess, the discourse-corpus intersection should, to a considerable extent, relate to patterns in written or spoken registers. One of the ways which discourse analysis operates is by focusing on functions and structures of texts composed of sentences which are regarded as *beyond* or *above* what they appear. This is where text-linguistics comes into the scene. The focal point of this chapter will be the domain where discourse analysis and corpus linguistics intersect and its potentials to yield a better understanding of non-nativeness in second language texts.

DISCOURSE AND THE CONTEXT OF LANGUAGE TEACHING

Decades ago, when the importance of real language directed linguists towards new perspectives in language teaching/learning, topics such as *speech acts*, *functions and notions* and *communicative competence* were being discussed (see Austin, 1962; Searle, 1969 and Halliday, 1978). The newly embraced perspective was that people and societies used language to fulfill their needs to communicate and this language was quite different from the ones that were being taught in language classes. Ignoring the external communicative functions or purpose of the real language started to make less and less sense to theoreticians and practitioners. Communicative Language Teaching (CLT) could be counted as one of the outcomes of these discussions. With authenticity and communication at the center of the new paradigm, authentic reading and listening materials were integrated into language classrooms, and meaningless drills and made-up texts were discredited. Since then, discourse studies have played an important role in shaping the language learning/teaching process. However, this seemingly simple cause-effect relationship is neither linear nor one-dimensional.

The relationship between discourse analysis and language teaching is covered in other chapters of this volume. The topic itself is a broad one with many aspects, and one of them concerns contrastive rhetoric and how it contributes to discourse analysis in terms of EFL.

Contrastive and Intercultural Rhetoric

In classical terms, rhetoric is concerned with the art of persuasion and oratorical authority. The first sense of rhetoric was related to the speeches made by dispossessed landowners arguing their claims in front of other citizens, which dates back to the 5th century BC. In time, it gained philosophical connotations. The trinity, *ethos* (the authority of the speaker), *pathos* (the emotional state of the speaker) and *logos* (the rationality of the language used), was defined by Aristotle and has been widely used. By 16th century, rhetoric had started to appear in letter writing as an ornament, and ironically, the paradigm that regards language as a reflection of reality has made a shift towards the understanding that language actually shapes or determines reality.

On the other hand, the term Contrastive Rhetoric, which is a relatively a more recent topic of interest, simply discusses the possibility (*or the impossibility*) of inter-cultural transfer of all available linguistic and cultural means which is supposed to yield native-like second/foreign language writing. Basically, contrastive rhetoric refers to the effects of first language and culture over the second one. The idea to analyze and reveal these effects dates back to 1960's when it was realized that the ability to write grammatically acceptable writing in a target language doesn't necessarily mean producing acceptable texts in the target culture. After analyzing 600 texts written by EFL learners, Kaplan (2001) reached to the conclusion that these texts actually contained indirectness and inductive reasoning, which was actually one of the characteristics of oriental cultures and languages. In addition to this, English expository writing is thought to be linear in discourse organization whereas other languages are dubbed digressive. This promoted the idea that EFL learners were actually writing in their own language but just using the English lexicon. As Kaplan (2001) puts it,

A fallacy of some repute and some duration is the one which assumes that because a student can write an adequate essay in his native language, he can necessarily write an adequate essay in a second language. That this assumption is fallacious has become more and more apparent as English-as-a-second-language courses have proliferated at American colleges and universities in recent years. Foreign students who have mastered syntactic structures have still demonstrated inability to compose adequate themes, term papers, theses, and dissertations. Instructors have written, on foreign-student papers, such comments as: "The material is all here, but it seems somehow out of focus," or "Lacks organization," or "Lacks cohesion." And these comments are essentially accurate. The foreign-student paper is out of focus because the foreign student is employing a rhetoric and a sequence of thought which violate the expectations of the native reader (Kaplan, 2001, p. 13).

Kaplan (2001) relates this issue to the idea that the thought sequence of English, being no better or worse than any other language, is a descendent of Platonic-Aristotelian thought system shaped by Romans, Medieval European and Western thinkers later to come. This point of view actually reflects the basic idea behind the linguistic relativity theory in which language is regarded as an integral system of the human mind. That is to say, individuals perceive and render the outside world mostly through their native language. With this supposition in mind, many urban legends about language were created. Some claimed that the Eskimo language has more expressions related to snow than any other language on earth, or it was seriously discussed that some Native American languages lack the concept of time making its user see a totally different world from the users of other languages. One famous story even tells us that once an Amazonian tribe, the Pirahã, gave a devout Christian missionary, Daniel Everett, hard times because each time he talked about the Christian god, the tribesmen repeatedly asked him when or how he met this god, or they wanted him to change the subject and talk about *mundane endeavors*. It has been speculated that their native language lacks the concept of the past that the English language possesses, and this so-called deficiency hinders its speakers from talking about the things they heard happened long time ago because they are living in the present. It is no surprise that such discussions have given rise to a more empathetic standpoint in terms of language and culture.

After taking into consideration this empathetic standpoint and the accumulated research outcomes, Connor (2002) suggested the term *intercultural rhetoric* instead of contrastive rhetoric. The rationale behind this reconceptualization was mostly related to the criticism of contrastive rhetoric because of its insensitivity to cultural differences. In this respect, labeling EFL learners depending on their L1 backgrounds didn't seem right (Spack, 1997); the perception of culture as something discrete and discontinuous was criticized (Zamel, 1997); and focusing merely and too much on texts and disregarding other aspects of writing were opened to discussion (Scollon, 1997). In terms of contrastive rhetoric, learners were supposed to fulfill the expectations of the native speakers of the target language rather than freely expressing their own ideas through their own cultural backgrounds. These discussions have raised questions about the validity of such an approach and a common idea emerged concerning a need to become more aware and sensitive to the intercultural aspects of second language writing. There was a shift from analyzing what texts *mean* to understanding *how they construct meaning*. In order to guide the analysis of writing from this standpoint, Bazerman and Prior (2004) posed three questions:

- What does the text talk about?
- How do texts influence audiences?
- How do texts come into being?

Through these questions they wanted to put emphasis on the practices people are engaged while trying to create texts. It was actually an appreciation of the social contexts by which external communicative functions are realized. In the same way, the fallacy of thinking the author of a text sitting in front of a computer screen or a piece of paper on a desk is highlighted and it is claimed that some genres of writing, especially academic ones, are actually an accumulation formed by thousands of different writers in different times.

CORPUS LINGUISTICS

To begin with, corpus linguistics is mainly a method to carry out linguistic analyses but not an independent discipline per se. For instance, a language teacher realizes that EFL learners tend to use the phrase '*I think*' too frequently. Hundreds of EFL essays at hand could be analyzed to see whether it is an idiosyncrasy or not. The question at this point is: What counts as *too many*? To answer such a question, every instance of the phrase '*I think*' should be counted. However, since it would be very time consuming and meaningless without comparisons, the results would be questionable. Suppose that a processor does the counting by taking into account millions of words and makes comparisons, then the hunch stemming from an idiosyncrasy could turn into a statistically-supported pattern. Basically, this 'millions of words' is called a corpus.

Corpus could be defined as a collection of texts or speech samples stored on a computer or a digital device. These texts are collected systematically and in accordance with certain principles. The contexts provided by corpus are rich because they consist of millions of words, and they are natural because they are collected without any modifications, which

means that the language samples collected include human errors like misspellings, mispronunciations, hesitations, false-starts etc.

Corpus linguistics emerged when language was regarded as something observable. The first attempts to reveal what is *more than meets the eye* in texts came from the biblical scholars in the 13th century. They indexed the words in the Christian Bible manually, created lists to help other scholars understand it better. The technical term *concordance* also dates back to this era. The prefix *con-* means ‘together or with’, and the root word *cor* means ‘heart’ in Latin. It embraces the idea that words alone hardly mean anything, and a deeper insight of a text could be gained by evaluating the words that occur in the same context. This kind of insight becomes possible only through systematic observations of the language.

The perspective regarding language as observable has been around for a relatively long period of time, with some paradigm shifts in time especially after the distinction between *parole* and *langue* was made by Ferdinand de Saussure (Finch, 2005). The term *parole* refers to the real language in use, and *langue* is regarded as a much more complex system in which *parole* is produced. Similarly, according to Noam Chomsky, human knowledge and especially language take their roots from an unconscious system (Saussure’s *langue*) which enables utterances in any language; a model which is actually based on human competence. However, there are also supporters of a performance based model of language which takes into consideration the actual psychological and physical processes involved during language production (Saussure’s *parole*). In this discussion, it was once stated that “... information about the speaker-hearer’s competence ... is neither presented for direct observation nor extractable from data by inductive procedures of any known sort.” (Chomsky, 1965: p. 18). From this perspective, it is quite understandable for Chomsky to see corpus data as *junk* (Aarts, 2001, p. 6). As a counter discussion, corpus linguists believe that a word in or on itself does not carry any meaning, but the meaning is often made through several words in a sequence (Sinclair, 1991); and “[t]he aim is not to study idiosyncratic details of performance which are, by chance, recorded in a corpus. On the contrary, a corpus reveals what frequently recurs, sometimes hundreds or thousands of times, and cannot possibly be due to chance” (Stubbs, 2004, p. 111).

These discussions are still going on, and as digital data storage is becoming easier, digitalized and compiled language data is also becoming more and more accessible. The Brown Corpus, which was compiled in 1960’s and initially contained digitalized documents comprising of a million words, has reached a total of 100 million words and is widely in use today.

With the emergence and development of optical character recognition systems (OCR), tremendous amount of language data started to accumulate. By using OCR scanners, any type of orthography can now be digitally stored and processed. The internet, which is theoretically a kind of corpora in linguistics term, also contributed to the accumulation of language data. After the introduction of the Internet, large language samples started flowing online through emails, websites and personal blogs. This immense growth also caused problems about interpretation. Less wasn’t more, but dealing with such colossal language data was, and still is, beyond human capacity. To solve this issue, numerous free or commercial software packages and online tools have been developed. Microconcord, WordSmith Tools, Coh-metrix, AntConc and Statistica are among these tools, and they are widely known and used.

How Do These Software Work?

Generally, the software mentioned above are numerically oriented, which means that they actually depend on word counts. Digitalized language samples are used to create datasets and structured queries are carried out in these datasets. For example, we want to learn the frequencies of the words used in *Romeo and Juliet* i.e., which words are used more than the others. Digitalized text of *Romeo and Juliet* is the dataset here and the software WordSmith is making the query. After the process we get the screen in Figure 1.

In Figure 1, the words used in *Romeo and Juliet* are ordered according to their frequencies. As usual, ‘*the*’ is at the top of the list and is followed by ‘*and*’ and ‘*to*’. This is actually a very typical process in terms of word counts. The aim is to see whether the word frequencies in any given text differ significantly or not. For example, several datasets could be compared to see if they contain significantly different word types. If we want to test the hypothesis that *spoken register contains more verbs than written register*, then we will have to make word counts to see the differences among the word types that our dataset includes. The critical point here is that these software will hardly recognize the word types unless the dataset is tagged accordingly.

These kinds of software are also used to look for collocations in a text. Collocation is a term used to refer to the *lexical neighborhood* of a given word. For example, we want to learn what other words occur together with the word *ago*. With the help of a processor we can get a statistical picture of the words that tend to co-occur with *ago* as in Figure 2.

Figure 2. Collocations of the word 'ago' ordered by frequency.

As is clear in Figure 2, *years* happens to be the most frequent word collocating with the target word *ago*. In the list, items such as *long*, *months* and *weeks* also stand out as the immediate neighbors of the target word. Such analysis is supposed to help EFL learners avoid the fallacy of considering lexical items as isolated units. Furthermore, this statistical standpoint is very likely to raise the perception that lexical units are not of equal importance.

One example of online inquiry systems is Coh-metrix (McNamara et al., 2005). Developed by a team of researchers from the University of Memphis, Coh-metrix is an online database which is used in text analysis at multiple levels. During calculations, it makes use of five main indices: readability scores, general word and text information, syntax, referential and semantic aspects and situation model dimensions. Each of these indices has several sub-indices. Although the database does some kind of counting, Coh-metrix cannot be regarded as a word counter in classical terms. It is an analytical digital tool which can single out each aspect of a text from the others and produces numerical values. On the website (see the screenshot in Figure 3) an input field is used to make multi-dimensional inquiries for a text.

In Figure 3, the text-input field is on the left with some other fields required to be filled. After submitting the text, an output field appears on the right where the numerical results concerning the indices mentioned before are displayed. The outcomes can be transformed into popular spreadsheet software, and a wide range of calculations become possible (see Graesser et al., 2004 for details).

corpus (Granger, 2003:530-545), subjects' proficiency levels were determined using a valid and reliable placement test (Allen, 1992). The results were checked to see if their levels were homogeneous as would be expected. However, the results of the test showed that the subjects' levels varied from A2 (elementary) to C2 (advanced) level, which, in our case, demanded adjustments concerning homogeneity. Therefore, only intermediate and upper level subjects (49) were involved in the study. The assumption was that the subjects who have proficiency levels lower than intermediate level would still be dealing with

Corpus Annotation

Annotation is defined as the practice of adding interpretative linguistic information to a corpus (Leech, 2005). Digitalized text in a database can be regarded as raw data, and it could be discussed that what we can glean out of it is quite limited. However, if one wants deeper insights as to the patterns in a given collection of texts, annotation is needed. There are different types of annotation like part-of-speech (POS), lemmatization, syntactical parsing, semantic (domain classifications) and coreference (discourse). If a researcher wants to focus on parts-of-speech, s/he has to tag the lexical items in the corpus according to their lexical categories. Similarly, if our concern relates to types and tokens, we need a dataset tagged for lemmas. The advantages of such an endeavor could be questioned. The deeper understanding about a specific language that we could reach aside, suppose that we have a corpus made up of a language we don't speak. If the corpus is annotated, to some extent, it will be easier to make deductions concerning the language at hand.

Corpus annotation helps us make interpretation from what is readily available in the texts. At this point, it is clear that human mind and its way of understanding a text is the issue (Leech, 1997). This is why, some researchers, like Sinclair (1992), advocate a minimal annotation and suggest that we should let the texts speak for themselves because interpretations are likely to vary from person to person.

The discussions as to whether these types of software and the outcomes they provide will help us gain new perspective on language are still going on. Some still claim that to better understand language in general, we should focus on the real outcomes and theorize accordingly; some others, with the Chomskyan perspective in mind, believe that the mentioned outcome is insignificant and to an extent *messy*; therefore studying the cognitive processes is the only way out to a valid ground about language in general. Apparently, taking such a dichotomous standpoint wouldn't solve many problems. Instead, by making use of tangible data, it is much more reasonable to develop a *but-it-helps* attitude. It is obvious that just by analyzing spoken or written language samples we cannot say much about the core mechanisms of a supposed language organ, but this kind of analysis could help us see patterns in languages that we are dealing with.

With the abovementioned attitude, applications from different areas of study derived from corpus linguistics; among them the most noteworthy ones are lexicography, translation, stylistics, grammar, gender studies, forensic linguistics, computational linguistics and language teaching (Tognini-Bonelli, 2001). The important point here is not what has been listed but what is actually missing: discourse analysis. Discourse analysts have been slower in making use of what corpus linguistics has to offer because of the seemingly de-contextualized nature of text fragments that corpora provide (Thornbury, 2010). In this respect, language samples without clear contexts, simply lacking the answer to the question 'Who is saying what to whom?', hardly overlap with the theoretical framework on which discourse analysis is based.

LEARNER CORPORA: A NEWER PERSPECTIVE

Learner corpus (LC) simply means the collection of written or spoken language samples produced by learners. These samples are compiled by using certain criteria. Parameters such

as learners' proficiency levels, genders, ages and nationalities are taken into account in the compiling process. The idea of systematically compiling learner corpus is often attributed to Sylviane Granger and her team's studies dating back to early 1990's. Since then, numerous studies have been carried out. Granger (2008) summarizes the results of these studies and establishes certain points that need clarification. To begin with, she separates learner corpora from native ones in terms of their sources. It means that the data is gathered from English language learners from different L1 backgrounds like Spanish, Swedish or Chinese. On the other hand, written or spoken productions of EFL learners from countries where English language has an official status are not considered valid.

The context which learner productions are taken from is another topic of concern. Collecting and compiling a native English data is mostly uncomplicated as there are no critical issues such as language proficiency level or the structural differences between the native and the target language; however, it is rare for EFL learners to naturally produce written or spoken language samples in English. This is why, tasks like reading aloud, picture descriptions or informal interviews are used to create contexts where language learners can produce such data. At this point, it is reasonable to suppose that there are more written data than spoken because, mostly for practical reasons, written data from EFL learners is comparatively easy to collect and digitalize.

Another issue in LC collection is the size which roughly refers to the total number of words it includes. Generally speaking, there is a common agreement that "small is not beautiful, it is simply a limitation" (Sinclair, 2004: p. 189). However, sometimes even a collection of only one learner's essays might be of great asset. In addition, Sinclair (2005) states that small scale corpora are particularly useful in Language for Specific Purposes (ESP) in vocabulary instruction.

Many of the studies making use of learner corpora contain a kind of contrastive rhetoric whereby native essays are compared/contrasted with the learners'. Interlanguage grammar, error analysis, textual coherence/cohesion and lexical variety are among the common topics of concern.

One of the seminal studies trying to determine common deficiencies in EFL writings was Hinkel's (2002). She analyzed 68 lexical, syntactic and rhetorical features of L2 text. The corpus that she studied on included texts written by advanced learners of English from six different languages: Arabic, Chinese, Indonesian, Japanese, Korean and Vietnamese. By doing so, she wanted to obtain a broader comparison of EFL learners coming from different L1 backgrounds in terms of written register. According to Hinkel, even after years of study in English, the learners still lack some aspects that native speakers have. The results of her study indicated that L2 writers have limited lexical and syntactic repertoires, which led EFL learners to produce simplistic texts rooted in conversational discourse in English language. The results also showed that there is a big gap between L1 and L2 texts in terms of basic academic writing. EFL learners were apparently confused about or maybe unaware of the distinctions between spoken and written discourse. That's why they transfer one register into the other, and this makes their written productions look non-native.

The Case of Adverbial Conjunctions in Learner Corpora

One aspect of the non-nativeness in L2 texts concerns adverbial conjunctions in English. According to Halliday & Hasan (1976) conjunctions is one of the four cohesive devices in a text which express certain meanings with a presupposition of the existence of other related components in the discourse. From this respect, using a conjunction is both related to mental process (coherence) and textual representations of it (cohesion). The importance doesn't lie in the conjunctions themselves but in the contextual relationships they express.

From a grammatical point of view, conjunctions are generally considered in three different categories. Coordinating conjunctions connect the ideas in two independent clauses as in (1),

- (1) We had a board meeting, but it was postponed.

Subordinating conjunctions, on the other hand, connect the ideas in a dependent clause with an independent one as in (2),

- (2) Although we were strictly told to cancel all our plans, one of the board members is abroad.

Sentence connectors express the relationship between/among two or more ideas present in more than two different independent clauses (3).

- (3) Now we have to rearrange the whole week. In addition, our schedule is already very tight next week.

For many EFL learners, studying English conjunctions isn't an easy task, nor is trying to teach them always a fruitful one. For one thing, the learners have a tendency of regarding similar conjunctions as interchangeable units. After being instructed on adversatives like *but*, *however* or *nevertheless*, with the assumption that they all mean the same thing, they use one conjunction instead of another creating contexts that might look like breaches in discourse to the trained or native eye. Take the statements (4) and (5) for example;

- (4) My father thinks that I would make a good engineer, **but** I don't.
(5) My father thinks that I would make a good engineer, **nevertheless** I don't.

The second statement above (5) seems to be lacking proper usage of the conjunction *nevertheless*. The conjunctions *but* and *nevertheless* are generally categorized under the same group as adversatives or contrastive conjunctions. EFL instructors do this in order to facilitate things for the learners during the recognition phase. However, when the need to produce in the target language arises, most EFL learners fail to deal with conjunctions. Together with their teachers, they might even get more confused with statements like the following (6).

- (6) The Sharks played with two men in the penalty box, **but nevertheless** managed to score.

Another important point about conjunctions is that the same conjunctive structure can be used to fulfill different purposes in different genres (Ford and Thompson, 1986). For example, the following statement includes the adverbial *if clause* as a polite directive (7);

(7) I'll be happy if you can just turn the music down a bit.

Teaching conditionals in a mechanical way by referring to *types* seems to be handy to EFL instructors, but isolating these structures from their contexts is very likely to have negative effects over the learning process in the long run. As one might guess, teaching conjunctions is not as straightforward as it might seem. Of course this will remain just an insight unless supported by tangible data. However, the traces of this problem can actually be found in learner corpora.

In one corpus-based study, Schleppegrell (1996) analyzed texts written by EFL learners with an aim to reveal strategies for conjunctions that are typical of spoken English, and the focus of the study was the conjunction *because*. The participants were mainly Asian immigrants who had lived in the US for different lengths of time with advanced level of English proficiency. The results of the analyses revealed that the EFL learners in the study used the conjunction *because* more frequently than native speakers of English. An interesting parallelism between uses of *because* clauses in spoken English and ESL writing was also present. It was considered as an indication of how EFL learners transfer spoken register into their written productions.

Similarly, Altenberg & Tapper (1998) wanted to determine how advanced Swedish EFL learners use connectives in their argumentative essays. The learner data was from the International Corpus of Learner English (ICLE) and the reference corpus was gathered from essays written by American university students whose native language is English. Their focus was on three types of connectives: adverbial conjuncts (e.g., *therefore*, *in particular*); certain style and content disjuncts (e.g., *actually*, *indeed*); and some lexical discourse markers (e.g., *result*, *compare*). The results revealed that there is a significant plethora of adverbial connectives in the essays written by the learner group. In addition, this group also used slightly more types of connectives than the native speakers of English.

In another study, which also used corpus-informed methodology, Tankó (2004) analyzed learners' written productions consisting of 93 argumentative essays which were written in an examination by EFL learners. The learners were native speakers of Hungarian and their ages varied between 20 and 24. Their essays, which were composed of approximately 500 words, were compared with a reference native corpus, and the results of the analysis showed a comparative overuse of adverbial connectors. Supposedly, the rationale behind this overuse was that the Hungarian language does not require the overt marking of relations between linguistic units of the text. This structural difference is thought to be the reason why the EFL instructors in this specific context put more emphasis on the explicit teaching of adverbial connectors.

The abovementioned corpus-based analyses represent just one facet of how corpus methodology could be integrated into discourse analysis and they might provide us with a better understanding of EFL learners' written productions by taking into account the quantity of English adverbial conjunctions. It's reasonable to suppose that the overuse of these conjunctions create an unsteady discourse in EFL learners' writings. Besides, this overuse

doesn't seem to be of any help in terms of cohesion which is actually the major concern with conjunctions.

The way we teach adverbial conjunctions could be questioned here. As was mentioned before, context-free categorization of conjunctions might be creating false pictures in the learners' minds. It is interesting that in our native languages we don't normally use conjunctions with similar meanings interchangeably. Depending on the discourse context, conjunctions seem to fall into their places naturally. On the other hand, EFL learners seem to be enjoying English conjunctions more than needed, which is supposedly not the case in their native languages.

As has been discussed so far, corpus linguistics is a methodology that could prove useful for discourse analysts. Emerged from a need to better understand scholastic texts hundreds of years ago, corpus linguistics has gained systematicity over the years with the advancement of digital technology and related domains such as the Internet. Data is still building up and one of the corpora, COCA (Corpus of Contemporary American English), has recently reached up to 450 million words in total. Discussions as to the usefulness of collecting authentic language samples are also going on. The idea that human language cannot be evaluated solely depending on the oral or written outputs takes its roots from the Chomskyan perspective that regards human language as a complicated system and claims that it should be analyzed as such. Nevertheless, the domain of language learning/teaching seems to have benefited from what corpus linguistics has to offer as a methodology through the results of analyses gleaned from learner corpora. Many aspects of learner language have been revealed thanks to these corpora. One potential aspect, language learner discourse, still awaits to be discovered through qualitative and quantitative methodology and the latter is likely to be realized by corpus analysis.

In terms of corpus linguistics, discourse analysis and English language teaching, the next thing to do is actually quite clear. What we need is more discourse-friendly collections of learner corpora with more discourse annotations to help us better understand the core aspects of both written and spoken EFL discourse.

Chapter 37

ACTION RESEARCH: THE EFFECTS OF TEACHER ORAL DISCOURSE ON EFL WRITING

Wayne Trotman*

School of Foreign Languages,
Katip Çelebi University, Izmir, Turkey

ABSTRACT

Research on the effects of feedback on EFL writing is well documented (Ferris, 1997, Ferris 1999), although Hyland and Hyland (2006:186) state: ‘Given how few studies have been carried out, little is known about the relationship between teacher and student discourse and teacher feedback in conferences and student revision’. The qualitative action research study outlined in this chapter addresses this imbalance. It concerns teacher-conferencing on academic essays written in a higher education context in Turkey. Based on a model of interrelated practices for action research suggested by Burns (2005), it investigates the relationship between discourse features of the conference and alterations made in follow-up drafts. Working with a constructivist approach to data, the study outlines how three Turkish teachers analysed transcripts of themselves conferencing in order to identify desirable features. Using such features, a second AR team repeated this procedure to investigate the relationship between the conference and amendments to follow-up drafts. The chapter outlines practical action research and conferencing. It looks in particular at the effect of two specific features of conferencing discourse: teacher-eliciting and the use of the L1.

INTRODUCTION

Burns (2010) illustrates the popularity of action research (AR) projects worldwide, and the value to ELT practitioners of AR outcomes. Studies into the effects of feedback on

* Corresponding Author Email: waynetrotman@gmail.com.

EFL/ESL writing are well documented, in particular in articles by Ferris (1997 & 1998) and at book length by Hyland and Hyland (2006). In contrast, while few accounts of AR projects looking at the effects of feedback on writing seem to appear in the research literature, even fewer involving AR or any other research method appear to have looked at the effects on EFL/ESL writing of perhaps the most interactive method of feedback, that of teacher-student oral conferencing (from hereon, 'conferencing'). This chapter analyses the impact on revision drafts of two specific features of conferencing discourse: teacher-eliciting and the use of the L1.

LITERATURE REVIEW: THE ROLE OF FEEDBACK IN APPROACHES TO TEACHING WRITING

However time-consuming feedback provision may be for teachers, it is generally agreed to be helpful towards developing writing skills. Learners tend to view feedback as desirable, even crucial, and value it as a means of assistance. Investigations into its effectiveness have flourished in recent years, although conclusions surrounding feedback types and their degrees of effectiveness in terms of improvements in writing on the whole tend to vary or conflict. Although a variety of means are available for the provision of feedback, such as error-correction, and teacher-written commentary, commenting on conferencing, Hyland and Hyland (2006: 186) conclude that: 'Given how few studies have been carried out, little is known about the relationship between teacher and student discourse and teacher feedback in conferences and student revision.'

Goldstein and Conrad (1990) noted how revisions appeared to occur when they had been negotiated, while not going into the specifics of which features assisted such revisions. Patthey Chavez and Ferris (1997) found that all student revisions were conference related, while two other findings were that the same treatment in the conference does not generate the same response from all students, and that what they term the 'divergent backgrounds' students bring to it may affect the conference. (1997: 51). More recently, working with advanced writers, in terms of specific features of conferencing that impact successfully on revised drafts, Weissberg (2006) found that the observable discourse mechanism of dialogic 'scaffolding' (verbal support for the learner), in particular through questioning and phrase repetition provided salient means of assistance, although he concludes (2006: 262) "the impact of scaffolding on students' later written drafts remains to be determined".

This chapter addresses the point made by Hyland and Hyland above by examining and outlining the role of two specific discourse features: teacher-eliciting and the use of the mutual L1. For each of these features, three extracts from data generated during the research are analysed. In terms of its findings concerning the use of these features, I believe the points made will prove valuable to teachers of writing engaging in conferencing. The full-length version of this study from which this chapter draws its data is a doctoral thesis for The University of Warwick (UK), while an expanded version of this chapter also appears in ELTED 14.1 (2011).

An Action Research Framework

While variations of Lewin's original concept of AR (1946) have been proposed, the best known is the model by Kemmis and McTaggart (1988) which consists of a cycle of plan - act - observe - reflect, although Burns (2005) points out how critics such as Elliott (1991) believe Kemmis and McTaggart (1988) over-represent action research 'as a series of fixed and predictable steps.' Believing it to offer more flexibility within an AR approach, this study implemented Burns' (2005) contrasting and more detailed framework of what she terms 'interrelated experiences.' This appears below in Figure 1.

Figure 1. Burns' (2005) suggested framework for AR.

METHODOLOGY

The qualitative study outlined in this chapter was carried out in Turkey in a university preparatory year writing context. Following an investigative phase, it involved two AR teams which, apart from myself, consisted of Turkish teachers of writing. The study investigated the benefits to student writers of oral feedback on their work. It encompassed one complete AR cycle with two main stages, in this chapter referred to as Stages One and Two, each involving differing groups of teacher and student participants. With regard to teachers, Stage One was carried out by two males (N and Ö) and one female teacher (S), all experienced in teaching writing. Stage Two consisted of myself, plus S, the female teacher from Stage One, with the addition of another female (E). As each teacher at each stage provided oral feedback on the essays of two students from their classes, the study thus involved twelve preparatory class students at lower- and intermediate-levels. Written permission was obtained from each student for their names to appear in the eventual public document.

Although this chapter refers to a 'framework', it would perhaps be more accurate to view its phases as a series of overlapping interrelated experiences. Two points which this chapter identifies are that some phases of the framework tend to work in tandem, and that phase eight (below) appeared to be a dominant feature of the study.

This chapter focuses on what happens in the writing conference and its relationship with the revision process. It identifies issues involved when two conferencing features – those of eliciting and the use of the mutual L1 – were used. Such issues concern alterations made by students on follow-up essay drafts. In doing so the chapter responds to Hyland and Hyland (2006: 96), writing on the effects of oral response, and reflects their conclusion that, concerning the features used and moves implemented, '...the type of verbal interaction taking place in the conference has an influence on the type of subsequent revision.'

Exploring and Identifying

In order to locate patterns regarding feedback on writing at the institution concerned, I initially made audio-recordings of group and follow-up individual interviews with six teachers of writing. My analysis of the transcripts revealed how error-correction and teacher written comments predominated. Also revealed, however, was that, although used by only two of the six teachers, conferencing with students about their essays, either on an ad hoc basis during the lesson or in an office following it, appeared to be both mutually appreciated and highly valued. Feeling that the comment by Hyland and Hyland (2006) concerning the paucity of work carried out on conferencing and follow-up revisions to be a research space, I investigated the relationship between features of the discourse of conferencing and their effects on follow-up drafts. As Extracts 1 to 6 in this chapter indicate, such a relationship is often complex.

Planning and Data Collection

The AR team for Stage One conferences consisted of three Turkish teachers of writing: S, Ö and N. I was at this point working from the outside, helping set up and make audio-recordings of each teacher conferencing with the two students they had each selected from their writing classes. I then wrote up and, following member checks for their accuracy, analyzed the resulting six transcripts.

Stage One Data: Analyzing and Reflecting

Phases one and two of Burns (2005) framework formed the initial analysis, the first of what eventually became several mini-cycles of analysis (MCA). During this analysis teacher-eliciting was identified as a dominant discourse feature in terms of relationships between initial and follow-up drafts. The three examples below illustrate varying degrees of success using this feature. Evidence of the complexity involved in its use appears in Extract 1 where, after commenting as follows in her conference with student G on a sentence which in fact was entirely correct,

Extract 1

S:	so instead of however you can say.. in..
G:	in addition
S:	you can say in addition or.. or maybe while you are doing all these
G:	meanwhile
S:	there's an alternative to meanwhile..in the...
G:	in the..
S:	in the meantime.. both of them are possible..

(Student) G altered '*However, you should also subscribe to an internet server company..*' to '*Subsequently, you ought to subscribe to an internet company*'. It is interesting to note here how G, having himself suggested the alternative 'meanwhile', opts in his follow-up draft for something completely different. Also, instead of rewriting a later sentence containing the

incorrectly used 'meanwhile', he completely omitted the sentence in the second draft. Such points reflect the difficulty in establishing relationships between conference discourse and follow-up revisions.

Hypothesising and Speculating

Implementing phases three and four of Burns (2005) indicated the interrelated nature of phases of the framework adopted for this study, as further analysis took place when planning how to proceed based on the outcome of MCA One above, the initial analysis. This further analysis was analysis as reflection rather than as action. At the same time it formed part one of a second MCA.

Intervening

The intervention at this point, phase seven in Burns (2005) framework, functioned as a continuation of MCA Two. Due to unforeseen circumstances a new AR team had to be formed. While adaptation of Burns (2005) involved further planning and data collection within the intervention phase, it was noticeable how MCA Two also built upon the previous MCA. The second MCA led to our adapting the framework of Burns (2005). To an extent, MCA Two and Three may belong to the same mini-cycle, and indicate how the borders of such MCAs may not be clearly defined.

N and Ö withdrew from the study without notice, both intending to complete their own doctoral studies. Their leaving meant only S remained from the original AR team. At this juncture, and prior to Stage Two conferencing, I decided to alter my role from outside facilitator to that of inside joint data-generator, feeling this was more in the spirit of AR. Following my invitation, E agreed to participate in the study. The study thus proceeded once more with a team of three, this time with two female Turkish colleagues and myself.

Stage Two Conferencing

According to Burns (2005), following the hypothesising / speculating stage, there should then follow a stage involving intervening and, later, observing. In order to intervene and observe what happened when points arising from both analysis and hypothesising concerning future conferencing were implemented, however, it was firstly necessary to re-implement a previous stage, that of planning / data collection. In fact it would appear that in the case of this study the intervening and observing would then, prior to the reporting, writing and presenting stages, be followed by further analysing / reflecting. The remainder of the study involved observing and analysing. This adaptation of the order reflects Burns (2005: 59) who suggests that processes experienced by action researchers are 'best viewed as necessarily adaptive to the educational situations and circumstances of the participants.'

Observing and Analysing: MCA Three

Observing while analysing continued, with each member firstly carrying out an independent analysis of each set of conferencing data prior to collaborating to agree on matters. The outcome of this was MCA Three, which concerned the team working individually on the second set of conferencing data. This analysis reflects a complete contrast to MCA One, during which I assisted three teachers with analysing only the particular conference they were involved in.

The outcome of MCA Three was a realisation that we needed further refinements to our analysis, i.e., action that involved adapting our tools for analysis. It also became clear during this MCA that identifying and tabulating points raised and relationships to follow-up drafts was not an easy process. In this regard it is important to point out how, in accordance with qualitative studies and working within the constructivist paradigm, the relationship may not be observed as merely cause-effect. At this point I believed it might assist with the study if, as a team, we firstly identified points indicated by the teacher for discussion in the conference, then located and agreed on sections of the transcript within which each point was covered. With the benefit of hindsight, doing so much earlier in the study would have been extremely helpful. This means of analysis is indicated in Table 1.

Table 1. Refinements in analytical tools

Draft One Point	Turn(s)	Feature(s)	Draft two	Category
6: ‘increase the quantity of penalties’	50-68	L1	‘introduce stricter penalties’	One

Observing and Analysing: MCA Four

Moving onto the third set of Stage Two conference data resulted in MCA Four, where once again we noted a relationship between teacher-eliciting and alterations on follow-up drafts. A second example of the use of this feature appears in Extract 2:

Extract 2

S:	what does this sign mean (indicating her symbol denoting a missing word) what is this
F:	to ermthere needs to be a verb
S:	a verb there.that’s right..you need something there..what do you think
F:	to erm
S:	increase

Compared to the complex issues involved in identifying relationships between a conference and alterations in the previous example in Extract 1, data in Extract 2 show perhaps more clearly how F has altered successfully, although in this case S ultimately provided the correct verb. F altered ‘*Another solution would be to advertise campaigns..*’ to ‘*Another solution would be to increase the number of advertising campaigns..*’

Conferences Four to Six: MCA Five

With the tools for our analysis complete by this point, we were able to analyse the remaining Stage Two conference in the same manner, resulting in a single and final MCA. Analysis of the fourth of our six sets of Stage Two conferencing data was the first part of an MCA that also covered conferences five and six. A more successful example of the use of eliciting and successful alterations in the follow-up draft appears in Extract 3.

Extract 3

F:	it doesn't er seem good
S:	how can you make it better
F:	I can add..I can add er this essay er discusses these precautions er

Based on the exchange above, in which F and S discuss how to make the essay more reader-friendly, F added to his introductory paragraph '*In this essay I will try to discuss these precautions.*'

Data in Extracts 1 to 3 therefore indicate varying levels of relationships between conference discourse and outcomes on follow-up drafts. The first extract indicates how problematic it may be to detect the relationship between teacher-eliciting and follow-up draft revisions, while the second indicates how eliciting alone may be insufficient. In the third extract however, teacher-eliciting proved entirely successful.

Stage Two Data Analysis: L1 Use during Eliciting

The second discourse feature this chapter looks at is the use during conferencing of Turkish, the mutual L1. Extracts 4 - 6 below analyse the effect of using this feature during conferencing. Early on in the analysis of data generated in Stage Two the AR team noted how limitations concerning the language levels of students with whom to conduct conferences may be at least partially overcome by using the L1. Data from conferences four to six in Stage Two, however, indicate how eliciting in the L1 also appeared to be valuable, although still not without problems. Extract 4 indicates how S did this to correctly elicit 'strict'. (The Turkish appears in bold, while the correct translation follows).

Extract 4

S:	more natural English?..instead of increase the quantitymaybe you can say daha sıkı cezalar.. daha sert cezalar (stricter penalties.. harsher penalties)
F:	yes strict..strict
S:	yes..that's right

Based on this exchange, F altered '*First of all government should increase the quantity of penalties*' to a perhaps more stylistically superior '*First of all, the government should introduce stricter penalties.*'

In Extract 5 (a continuation of Extract 2 above) S uses Turkish to successfully elicit three possible options, of which, as his alterations in Extract 2 indicate, F used ‘number’ in: *Another solution would be to increase the number of advertising campaigns..’*

Extract 5

S:	what of advertising campaigns can you increase ...nesini artırabiliriz (what can we increase)
F:	say amount mik...
S:	sayısı (amount) that’s correct ..sayısı artır (increase the amount)
F:	quantity..amount..number
S:	that’s right ok so if you say//

In Extract 6 below student F is once again able to build on S’s use of the L1.

Extract 6

F:	mmm
S:	I know what you mean .zorlaştırmak (increase the difficulty)
F:	zorlaştırmak yes
S:	but how do we say it.. what is this structure
F:	yes..I learned it.. you said it in class
S:	oh..did I.. ok
F:	make it er to make ..to make more difficult
S:	but..not more difficult..make difficult is ok but you need another word here..you need a pronoun

Based on the exchange here, and reflecting how the use of the L1 was partially successful, student F altered ‘*Another precaution which government can take is making difficult having driving licence*’ to ‘*Another precaution which the government can take is making more difficult for people to have a driving licence.*’

A close look at Extracts 4 to 6 and revisions made by the student on his follow-up draft indicate how the use of teacher-eliciting in each, when backed up with the use of the L1, led to successful outcomes on each occasion.

CONCLUSION AND DISCUSSION

This chapter, involving the location and analysis of desirable conferencing features in terms of beneficial effects on follow-up drafts, firstly reflects how AR cycles are not linear, but involve overlapping and interrelated phases. Analysis of the six extracts above reveal how, although problems may still occur in follow-up drafts, teacher-eliciting, especially with the aid of the L1 would appear to be of valuable use when conferencing.

The findings support and extend the work of Goldstein and Conrad (1990) mentioned earlier in this chapter. Along with the degree of negotiation Goldstein and Conrad (1990) refer to in terms of the requirements to improve the follow-up draft, analysis of Extracts 1 to 6 in this chapter also identify two specific discourse features with which to do so. In relation to

the point made by Patthey-Chavez and Ferris (1997), that the backgrounds of students may affect the degree to which successful revisions may be made, this may be true, but is beyond the scope of this chapter and would of course require further investigation. The findings outlined in this chapter certainly support and extend those of Weissberg (2006) on the use of scaffolding, especially with regard to two specific features of verbal support for the student writer involved in constructing essays.

Struggling at times to do so, writing up the original study on which this chapter was based was aided by points provided in Burns (2010: 161-162) in the hope that, as she suggests there, '...your audience gets good insights into the AR process, your findings and the insights you gained for improving professional practices.' I would recommend this list of points to others seeking to publish accounts of AR projects.

Chapter 38

DISCOURSE OF READERS' BLOGS IN COLLEGE-LEVEL ESL CLASSROOMS

Justin E. Jernigan^{1,*} and Yingliang Liu²

¹Georgia Gwinnett College, Lawrenceville, GA, US

²Wuhan University of Technology, China

ABSTRACT

Blogs have become a useful component in many language classrooms, with the benefits of contributing to incidental learning among students and promoting collaboration among all members of the classroom community and across the increasingly globalizing world. The usefulness of blogs in writing courses has been explored, but their role in increasing reading proficiency and critical thinking in reading courses is less clearly understood. This chapter aims to analyze the discourse of blog postings for evidence of critical reading and active engagement in college-level ESL reading classrooms. Fifty-six students in five advanced-level Reading classes in an English for Academic Purposes (EAP) program at a mid-size, public undergraduate college in the United States are described in this chapter. Over the course of each semester, the students posted blog entries about three novels on a weekly basis. In addition, the students completed a pre- and post-course survey measuring their attitudes towards reading and blogging. Discourse analysis of the blog postings revealed that students' critical thinking on the readings deepened over the course of each semester. The results suggest that blogging may be usefully implemented to improve students' extensive reading outside of class and active engagement with the text and other readers. Further, the feedback provided by the students in both the survey and in the blog postings themselves points to ways in which blogs can create a strong sense of community in ESL reading courses and similar environments.

INTRODUCTION

The recognition that online literacy is an increasingly important part of language learners' communicative competency is not new. Leu (2001) discussed the need to prepare students for global interaction by developing literacy on the internet. Leu also predicted that the pace of change in online communication would be rapid and challenging to manage, which has certainly come to pass in the past decade or more. In this chapter, we explore the implementation of blogs in college-level ESL reading classes. Based on our discourse analysis of students' blogs, we investigate the impact of blogs on students' motivation and perception of reading, on their interaction with their peers in an English for Academic Purposes (EAP) Reading course, and on their ability to read critically.

BACKGROUND: LITERATURE REVIEW

To address the new forms of texts other than traditional print, the New London Group (1996) introduced the concept of multi-literacy. *Multi-literacy* is a term adopted "to focus on the realities of increasing local diversity and global connectedness" (New London Group, 1996, p. 64). If this need was present in 1996, today it is even more urgent for educators to be aware of the reality of multiple channels of communication over which learners must gain control. In addressing the increasing demand for multi-literacy, a number of studies over the past decade have supported the importance of extensive reading in positively affecting students' reading approaches and perspectives or attitudes (e.g., Siah, 2008; Siah & Kwok, 2010; Pino-Silva, 2006). Building on Leu's (2001, 2002) work on literacy as a process that converges with online technologies, Hsu and Wang (2011) define *new literacies* as "literacy-related skills needed in an interactive multimedia environment, such as retrieving and evaluating information, comprehending information, and producing and publishing information through online technologies" (p. 69). In the current interconnected world, the reading curriculum needs to incorporate elements of authentic online communication. Online reading has been employed by many reading teachers and its benefit has been recognized. Pino-Silva (2006) found extensive internet reading can lead to incidental vocabulary acquisition and encourages teacher-student collaboration.

In addition to acquiring information online, new literacy also entails the ability to produce information online. Blogs, a fast means of publishing information online, have been increasingly implemented in education, especially in language teaching. The comment function of blogs allows the blog writer and blog readers to interact and exchange opinions in a timely manner, which creates a sense of community. It is this special kind of bonding among a community of learners that Dickey (2004) has in mind when discussing the benefits of blogs in distance learning for preventing the sense of isolation that such learners often experience. The increased prominence of community that is facilitated by learners' use of interactive blogs is further reinforced by Kelley and Clausen-Grace (2009). This phenomenon has a role to play not only in distance education contexts, we argue, but in any type of learning community in which deeper discussions of reading material are sought. As Sawmiller (2010) notes, blogs encourage writing, promote critical thinking skills, and offer differentiated instruction to fit students' learning styles in the science classroom.

Blogs in the Second Language Classroom: Background, Benefits, and Motivation

In the second language classroom, blogs are mostly used in the context of writing classes to promote peer collaboration. Abidin, et al. (2011) argue that blogging creates a Zone of Proximal Development (ZPD) where students feel comfortable to share not only ideas but also differences and help each other to achieve their learning goals. The EFL students in Malaysia in their study participated actively in the blog group discussion, which helped them complete the writing task and learn new vocabulary. Similarly, Wu and Wu (2011) employed a teacher's blogs and students' group blogs. Students wrote collaborative reflection on articles posted on their teacher's blog. Survey results showed that learners perceived the use of blogs positively for their language learning in that it improved their reading and writing skills. The students in the Taiwanese university they studied reported that they read faster and more fluently and could write more using different sentence structures and new vocabulary.

As language learners post their thoughts and reactions to the materials they are reading with their peers in blogs and then respond to the blog postings of their classmates, it has been argued that the enhancement of learners' ability to discuss, describe, and reflect upon what they have read is a key benefit of blogging that emerges. Renandya, et al. (1999) discuss retelling as a natural, enjoyable part of the reading process. In the process of retelling, learners frequently engage in elaboration and explanation, enhancing their own understanding of the material they have read in the process. Similarly, Al-Fadda and Al-Yahya (2010) found that blogging encouraged EFL students to complete pre-reading assignments, interact with peers, and engage in post-reading reflections.

A further benefit of blogs that has been proposed is that they facilitate sustained independent reading by learners. Increasing the amount and time of independent reading that language learners regularly engage in has been linked to benefits for younger students if implemented and supported appropriately, as pointed out in studies such as those examining the efficacy of sustained silent reading (SSR) and similar approaches (e.g., Reutzel, et al., 2008). Likewise, Izquierdo and Reyes (2009) note that blogs increased student autonomy in learning and reduced student dependence on teacher. The instructor used class blogs to post readings and students could comment on the readings. Students reported reading more outside the classrooms, using new vocabulary in the blogs and improving their writing skills.

Building on the generally favorable findings just discussed, Hsu and Wang's (2011) research established the positive impact of blogs in developmental reading classes, particularly with regard to student retention and persistence in studies. Blogging activities in the developmental reading classes they examined enhanced students' interaction and fostered a strong sense of community and rapport, both of which contributed to a higher retention rate compared to the non-blogging group. In addition, less vocal students who may have been hesitant to share in face-to-face classroom discussions felt more freedom to express their ideas in blogs, giving the reading blogs an equalizing quality (p. 80). On the other hand, their findings also indicated that there may be limitations in the usefulness of blogs if faculty members view them as merely add-ons to traditional reading activities, rather than as powerful tools for generating competency in new literacy skills.

A final benefit of blogs in the context of reading classrooms, one that is supported by our findings, presented later, concerns the potential for interactive blogs, particularly when used purposefully in a learning environment, to promote and elicit critical reading among the

bloggers and readers. So-called "fake readers" (Kelley & Clausen-Grace, 2007, 2009) exist not only among child language learners, but more insidiously among adult second language readers. Medelman (2007) notes the importance of teaching students to read critically in an age in which young people, including young college-aged adults, are increasingly engaged in passive activities (most online gaming, television and movies available on demand most anywhere, and many aspects of social media). Newman, et al. (1995) investigated group discussions of lectures and readings in face-to-face and online (asynchronous) formats. They found that more novel ideas emerged in face-to-face communication, but that increased justification and linking among ideas occurred in the online communication mode. Whether these findings may extend to blogging in reading courses is an important question that we examine in this chapter.

Besides understanding the possible benefits of blogs for reading, it is important to gain a better understanding of the factors that motivate students to use and benefit from blogs. Huang, et al. (2008) examined learners' motives for reading blogs, finding that these included affective exchange, information search, entertainment, and getting on the bandwagon. They also identified influences on reading blogs, including opinion acceptance, interaction intentions, and word-of-mouth (WOM) intentions. These motives and influences, if properly understood, can be applied in the context of reading classes to increase students' motivation.

The Sociocultural Context of Online Classroom Discourse

McCarthy (1991) provides educational and language researchers with a foundational understanding of discourse analysis (DA) as a means of understanding the functions—particularly the social functions—of talk in the language classroom. In many important ways, McCarthy and some other researchers working in the area of DA from the 1960s through the 1990s prefigure the present-day discourse analysis of blogs in their calls for understanding discourse as comprising not merely speech, but written interaction as well. Of critical importance in any effort at discourse analysis is the careful consideration of the context within which the interaction occurs. Therefore, the use of a DA approach to understanding blog-based communication requires a clear understanding of the classrooms, technology, and participants involved.

In a helpful example of such an approach, Lomicka and Lord (2012) analyzed the micro-blogging of language learners. Discourse analysis of the learners' tweets revealed the existence of "social presence" in the tweets of French learners, which is signified by affective and interactive indicators. Learners were found to talk about their lives, reply to each other and ask questions, thus building a strong community among classmates, which creates an optimal sociocultural context for language learning. However, how language learning in blogs is evaluated remains unanswered. Critical thinking skill is one essential skill in reading. Newman, et al. (1995) developed a content analysis method to measure critical thinking in face-to-face and computer supported group learning. Their analysis module included ten paired indicators such as relevance, importance, novelty, ambiguity, bringing outside information, interpretation, and so forth. A number of these indicators proved to be useful analytical tools in the present research effort.

Taking into account the generally positive results that have obtained in studies focusing on the use of blogs in the second language classroom, this chapter investigates the use of

blogs in a college-level English for Academic Purposes (EAP) reading class. We adopt a discourse analytic (DA) approach in order to understand the experiences of students who are using blogs to communicate about and fully engage with a series of novels read outside of class. Information on the students' perceptions of blogging and reading are given context as the voices of the students themselves emerge in their own words, in their own blogs.

METHODOLOGY

Fifty-six students in five different reading classes in an English for Academic Purposes (EAP) program at a public, 4-year college participated in the research effort described in this chapter. The 56 participants represent 14 different first language backgrounds: Arabic, Bahasa Indonesia, Bengali, Chinese (Mandarin), Farsi, French, Igbo, Korean, Pashto, Punjabi, Russian, Spanish, Vietnamese, and Yoruba. The EAP Program is part of the student support course structure of the college and offers classes in Composition, Listening and Speaking, and Reading. The average class size in the Reading classes is 15, ensuring a relatively low teacher-student ratio in these courses, and the areas of focus include enhancing reading skills and fluency, recognizing patterns of organization in academic texts, understanding and responding to college-level reading materials, and building academic vocabulary. In addition to readings in the course textbook, students are assigned to read three novels outside the class over the semester as part of the effort to build reading fluency. In the first semester, three books were chosen for outside reading: *The Unwanted: A Memoir of Childhood*, by Kien Nguyen; *The Kite Runner*, by Khaled Hosseini; and *The Help*, by Kathryn Stockett. In the second semester, two additional outside reading books were selected: *Tuesdays with Morrie*, by Mitch Albom; and *A Lesson Before Dying*, by Ernest Gaines. The third semester of the course featured two additional outside reading novels: *Things Fall Apart*, by Chinua Achebe; and *Water for Elephants*, by Sara Gruen.

At the beginning of the semester, students were assigned into blog groups of three or four (depending on the total number of the students in the class). Each group had a group leader who was regarded as relatively "tech savvy" and could help the group members with some technical issues in posting the blogs. In their groups, students determined the pace of reading by deciding the number of pages or chapters they would read each week, as long as the books were completed before the designated final blog for each book was due.

Each week, the students completed an individual blog entry in which they reflected on the segment of the outside reading novel they had read since the previous week's individual blog. In addition, on alternate days, students posted comments on their blog group members' blogs. This interactivity was made possible by grouping students into small teams known in the class as Literature Circles. Each week during the semester, students composed and posted blog entries addressed primarily to their Literature Circle teammates, who were reading the same novel at the same time as the blogger. Students were given much freedom on the content of the blogs. They could write about their own reaction to the part of the book they had read, analyze one of more major characters, discuss one or more selected paragraphs, draw connections to their own experience, relate the book to current events, and so forth. Students were encouraged not to simply summarize the chapters read.

Desire2Learn (D2L) is the learning management system (LMS) in which the students' blogs were hosted. The D2L blog feature allows students to post individual blogs and to create a "Blog Watch": a list of classmates' (and the instructor's) blog postings that they wish to read whenever those blogs are updated. Importantly, the blogs are semi-public within the college community, meaning that others who are enrolled at the college can view the blogs of any other student at the college, provided that they have valid credentials to log on to the D2L platform and have been given access to the blog feature by their instructor(s). One advantage of this system is that students are able to see the broad range of blogs being produced by other students across the college, which may give them a more complete picture of what can be done with educational blogs. More importantly, for the immediate context, perhaps, the students are made aware that they are writing for a potentially broader audience than just their instructor or classmates.

Comment Feature of the Blogs and Literature Circles

In addition to having the opportunity to express their views on the reading assignments, students were expected to reply to their Literature Circle teammates' blog postings. This comment feature of the blogs provided for authentic interactivity among the students within their Literature Circles. The online blogging and commenting mirrored, expanded, and supported the in-class discussions of the Literature Circle groups. Interestingly, the level of sharing provided for in the blogs expanded on that available to the students when sharing only in class. The availability of the learners' blogs to everyone with access to the college's D2L site meant that there was an element of audience and intrinsic motivation not present in traditional classroom-only communication. As Liao, et al. (2011) found, a blogger's motivation is strongly affected by her expectations of the outcomes of blogging. It is with that understanding that we next turn our attention to the blogs of our own EAP students.

Overview of Student Blogs

Before undertaking an in-depth analysis of the discourse of the students' blogs, we begin with an overview of the evidence for critical reading and critical thinking more generally in the blogs. In order to do this, we make use of Newman, et al.'s (1995) adaption of Henri's (1991) indicators of critical thinking reflected in online communication (pp. 6-8). A sample of 10 EAP students was selected, and an initial blog posting, posted near the beginning of the semester and a final blog posting, posted near the end of the semester, by each student were examined by both researchers independently to identify evidence of each of Newman, et al.'s indicators. Each researcher's findings were discussed so that consensus was reached on the final tabulation. Table 1 presents examples of the major categories of evidence and the numbers of tokens identified in the 10 initial and 10 final blog postings.

Table 1. Evidence of critical reading in EAP student blogs

Category	Example	Total Tokens in Sample	
		beginning of semester	end of semester
[R] Relevance	In both books the principals characters (Morrie and Jefferson) are resigned to died, but they teach us that we can died with dignity.[R] (Maria, L1 Spanish, female)	9	7
[O] Bringing outside knowledge/experience to bear on problem	In my last job I had witness some employees been exploited by bosses because they do not know how to express well in English.[O] (Carlos, L1 Spanish, male)	4	4
[A] Ambiguities: clarified or confused	It seems the circus was his gratest [sic] passion. That was why when people were doubting him that he gave water for the Elephant, he was outraged. [A] (Matthew, L1 Yoruba, male)	1	1
[I] Importance, Important ideas or interpretation	The only reason for Aibeleen to work under racism by Elizabeth and her colleagues was the enormous love for Mae Mobley [L] (Carlos, L1 Spanish, male)	2	5
[C] Critical assessment	He emphasized Amir's guilty at the beginning of the book to attract reader. Then he contrived Hassan's death that was really touched reader's feelings...Overall the author is effective with his unique style of writing. [C] (Min, L1 Mandarin, female)	3	7
[P] Practical utility (grounding)	I think this book teaches something to everybody; that one should never give up in life because your efforts will pay off in the end.[P] (Vedika, L1 Punjabi, female)	2	4
[W] Width of understanding (complete picture)	The two books has a same theme about Inequality. [W] (Min, L1 Mandarin, female)	0	2

Note: Learners are identified by pseudonyms, with first language (L1) and gender indicated.

Table 2. Frequency of indicators of critical reading in initial and final blogs

Blog set	Relevance [R]	Outside [O]	Ambiguities [A]	Importance [I]	Critical [C]	Practical [P]	Width [W]
Initial	90%	40%	10%	20%	30%	20%	0
Final	70%	40%	10%	50%	70%	40%	20%

The results of the analysis of the sample of ten initial and ten final student blogs across three semesters with respect to the frequency of occurrence of the indicators of critical reading are presented in Table 2.

Although most of the categories outlined by Newman, et al. (1995) showed little change over time (from early in the semester to the end of the term) in the samples of students' blogs, two of the categories do bear discussion. First, the Importance (I) category showed a change from two instances in the initial samples to 5 in the students' final blogs. As this category indicates the introduction of important ideas or interpretation, and increase here may be evidence of students' feeling increasingly aware of the connections between what they have been reading and specific significant concepts from their own lives or the wider world. An

increase in the I category may additionally indicate that students are more confident in sharing their increasingly complex views with their classmates.

The second category that showed a meaningful increase from the students' initial to final blogs was the Critical assessment (C) category. For most students, blogs at the beginning of the semester are dominated by the summary of the story with one or two sentences showing personal feeling about the plot or character. As the semester moved on, students started to offer more comprehensive assessment of the characters, events in the novels, and even evaluation of author's writing style. For example, in Rene's (L1 French, male) initial blog on *the Kite Runner*, he expresses his interest in the story, but does not explain why he enjoyed the book: "First read the book and enjoy the movie ". In his final blog on *The Help*, he offers a more comprehensive assessment of the characters: "It is like reading a story in the story. Miss Aibeleen is very smart...Miss Skitter is a very kind character...Miss Celia also she is my favorite character not because she keeps secret from her husband but she appreciate [sic] what Miny is doing." The inclusion of more critical assessment, as exemplified in Rene's final blog post, is evidence of students' active engagement with the reading and critical thinking.

As mentioned, the students' blogs did not show significant change over time for most of the categories suggested by Newman, et al. (1995). It may well be that the lack of complexity involved in some tasks resulted in a lack of significant differences in the blog samples identified. For example, 9 out of 10 initial student blogs sampled included an example of relevance (R). Provision of relevant comments was evident in 7 out of 10 final blogs in the sample as well. Where more complex critical reading was required, such as in the introduction of important ideas (I) and critical assessment (C), important differences were, in fact, observed.

DISCOURSE ANALYSIS OF THE BLOGS

Characteristics of the Discourse of Learners' Blogs

Blog entries by nature are normally relatively brief statements of the views and ideas of the writer. In the case of the student blogs that we have analyzed for this chapter, most followed the pattern of introducing the reading or portion of reading discussed in the blog, followed by the student's ideas and interpretation. As we analyzed the discourse of the learners' blogs collected over three semesters of the EAP Reading courses described earlier, a number of key concepts emerged in the discourse itself. Evidence of increasingly complex ideas, increased expression of subjective thought, and expanded intersubjectivity was identified over the course of the semester in the learners' blogs. A number of salient examples of each type of evidence drawn from the student participants' blogs are presented below. EAP students here are identified by pseudonyms, with first language (L1) and gender noted.

Increased Complexity of Ideas

Most of the EAP students described in this chapter demonstrated a gradual increase in complexity of ideas from their initial blog postings early in the semester to the final blogs

posted near the end of each term. In the example below, Maria moves from superficial notes about a character's actions to a deeper discussion of abstract concepts such as racism and death by the time of her final blog:

This kind of books like *Tuesday with Morrie*, are very interesting because is came from the personal real life characters, and the author promise to keep in touch with him, but he never did it. (Maria, L1 Spanish, female, near the beginning of the semester).

The difference in not only development, but also depth of ideas can be seen clearly in Maria's end-of-semester blog posting:

The comprehension and loving are the keys. *Tuesdays with Morrie* is the teaching how this two concepts combined can change people personal life. In *A Lesson Before Dying*, also comprehension and loving is the key to eradicated racism. In addition, death came in different ways: *Tuesdays with Morrie* by fatal disease and *A Lesson Before Dying* by fatal injustice. In both books the principals characters (Morrie and Jefferson) are resigned to died, but they teach us that we can died with dignity. (Maria, near the end of the semester)

Although Maria's focus in both blog postings is on characters, the move from characters' outward actions to their inner lives and motives, as well as to the lessons we can draw from their experiences, is significant.

An additional example of increasing complexity in reflection and critical thinking is observed when students begin to compare and contrast the novels. In the two blog posts below, one drawn from the first part of the semester and one from the end of the semester, Tam, a relatively recent immigrant from Vietnam, demonstrates growth as he progresses from a simple translation strategy for reading to an approach based on comparison of the motivation of the plots of all three novels read in the course of the semester:

I found it is hard to read this book. I had to translate more than half of the words. That is why I just got to chapter two. However, this story is very interesting. Therefore, I will try my best to read it. I hope by the time I get to the end of this book, my reading skill and vocab will be improved. (Tam, L1 Vietnamese, male, beginning of semester)

Tam's blog posting from later in the semester illustrates the increasing complexity of his analysis of the outside reading material:

Although the book used many Ibo words, I found that this book is easier to understand than the first two books. The difference between this book and the other two is that this book does not have a central story. Unlike, the advanture [sic] of Jacob in "Water For Elephants" or the confict [sic] inside Amir in "The Kite Runner", "Things Fall Apart" just tells the story of Okonkwo, who is a great man, but he got in trouble because of this temper. There is only two events that I think are two main problems of the story are the exlie of Okonkwo and the conflict between the slanmen [sic] and the people who build the church. (Tam, end of semester).

It is noteworthy that whereas Tam's initial blog contains general observations about the interest level of the book and his difficulty in reading, his final blog delves deeper into the content of multiple stories, analyzing the common crises across different plots.

Evidence of increasing critical reading from another student's blogs includes the following posts from Min's blog:

Khaled Hosseini, the author of *The Kite Runner*, used a fascinating style to tell the story. He emphasized Amir's guilty at the beginning of the book to attract reader. Then he contrived Hassan's death that was really touched reader's feelings. The authors composed many details about Amir's interior monologue. By the end of the book, the author repeated the theme, there is a way to be good again, to enhance the redemption. Overall the author is effective with his unique style of writing. (Min, L1 Mandarin, female, blog near mid-semester)

Her increased use of a critical analytic approach can be seen in one of Min's later blog postings, this one excerpted from a post near the end of the semester:

Kien Nguyen, the author of *The Unwanted*, used a fascinating style of writing in this book. The book was easy to read because the author used simple words and succinct sentences. He narrated the book by first person speech, and described his feeling directly and frequently. (Min, near end of the semester).

Increased Expression of Subjectivity

Following Roebuck (2000), Newell (1996), and others, we also identified evidence of students' increased ability and comfort with expressing their subjective views. The presence of subjectivity in students' writing about what they have read has been posited as evidence of the meaningful interaction of readers with text, and may indicate, "engagement with the story, with the personal statements offering emotional reactions to form and content and associative statements offering links between the students' understanding of the story and their experiential knowledge" (Newell, 1996, p. 165). Newell adds that subjective statements, such as those exemplified by the EAP readers below, are much more likely to occur in reader-based (as opposed to teacher-centered) contexts where learners are free to offer interpretive statements. We explore increasing subjectivity in several excerpts from Min's blog posts:

This is an impressive story about a pair of best friends in Afghanistan. Two boys grew up together as close friends, but one was a master, another one was a servant. The little servant obeyed everything that the master asked him to do, and protected his master as well as he could. Notwithstanding they were playing in same yard, but they were treated in total different ways. (Min, initial blog post)

By the mid-semester point, Min has moved from commenting on simple observations about the actions of characters in the book to comments about her own experience with the reading:

I am on Chapter 24 now. I would finish the book if I did not have a math exam. I am impressed by the ten chapters from 14-24. I never knew people could get punishment if they told truth in the U.S. Sounds the civilizations changed a lot. (Min, blog post near mid-semester)

In Min's final blog, there is clear evidence that Min is confident enough to offer deeper interpretation of the themes present in two of the novels:

The Unwanted vs. The Kite Runner

The two books has a same theme about Inequality. Hassan faced inequality during his whole life. Readers are easy to feel pitiful about the boy. Similarly, Kien in *The Unwanted* was treated as inequity because he was a half breeze [sic]. Another theme is redemption. In *The Kite Runner*, Amir made a mistake and tried to hide the secret. He hurt Hassan and had darkness in his heart, and he regretted his behavior for a long time. By the end of the book, Aim adopted his nephew as his son did remedy his fault. In *The Kite Runner*, Kien's grandparent refused to leave Vietnam when the war started. They wasted too much time. Finally, they knew if they had considered more about young generations; if they agreed to leave, Kien and his siblings would have escaped the war. They were too selfish when they made the decision. (Min, final blog post).

The progression of ideas in Min's blogs from the beginning to the end of the semester points to her increasing level of comfort with self-expression.

Increased Intersubjectivity

The notion of *intersubjectivity* when applied to the language learning classroom context refers to students working together to establish norms of engagement and socially constructed, agreed upon meanings (see, e.g., Hellerman, 2008, among others). In the culturally and linguistically rich EAP classrooms discussed and analyzed in the present chapter, the need for students to co-construct a culture of learning in which individuals feel encouraged to share their subjective views is of vital importance. Because of the layer of cultural and linguistic background differences within which the students are negotiating meaning and establishing common ground with their peers, some of the assumptions that students in a more culturally and linguistically homogenous classroom environment might hold are simply invalid in the EAP Reading classroom.

Evidence of intersubjectivity is found in students' comments on one another's blogs. Students have the opportunity in the blog responses to ask for clarification on their Literature Circle teammates' ideas. As mentioned earlier, the students are instructed to target their blog responses to the ideas and assertions in their classmates' blog postings, rather than simply giving their own opinions. This emphasis on others' ideas promotes intersubjectivity and fosters the sense of community that is so important for allowing students to open themselves up to their Literature Circle teammates and others.

A useful example of intersubjectivity is Rene's commentary on Hua's blog (L1 Chinese, female) about her reaction to how Aibileen felt when she lost her son in the book *The Help*. He not only offers supportive praise to his classmate regarding her earlier blog post, but also expands upon some of the specific ideas she expressed.

I like the way you broke down the part that you red and find very touching. Indeed the part you [sic] just explain at the beginning [sic] the way Abileen [sic] felt when she lost her child. It was very sad. As I am reading this different novel, I learn that many narrators want to captivate the reader mind and heart through the character in the book and Kathryn Stockett did a fabulous job with the help. (Rene, end of the semester).

The intersubjectivity established among peers in each Literature Circle group provides a foundation for the collaborative construction of more advanced analysis of texts as students think critically together. For example, clarification of ambiguity [A] can be observed in some of the blog comments students provided to their peers. An example is Matthew's commentary on Nina's final blog:

All his expectations just ruined. He, actually, had not been worried [sic] about being forgotten by his kids. He was waiting for this day, thoughts that he going to see circus bring out all his memories. This is a sad final of this story. (Nina, L1 Russian, female, end of semester blog)

Matthew's comment demonstrates clearly that he is responding to Nina's post, rather than simply offering his own thoughts on the novel's plot:

Jacob was really [sic] devastated when his children did not show up to take him to circus. It seems the circus was his greatest [sic] passion. That was why when people were doubting him that he gave water for the Elephant, he was outraged. (Matthew, L1 Yoruba, male, in reply to Nina, end of semester)

He offers here both confirmation of Nina's claim about Jacob's disappointment in *Water for Elephants* and an explanation for the sad ending mentioned in her final blog. An additional example indicates how students also use their blogs to communicate practical advice to their peers. In the following example, Vedika offers her classmates advice on applying the moral principles from one of the novels: "I think this book teaches something to everybody; that one should never give up in life because your efforts will pay off in the end." This example of intersubjectivity is echoed in a number of the other students' blogs and blog responses.

Students' Perceptions: The Reading Blogs Survey

As mentioned earlier in our description of our research as presented in this chapter, a survey was distributed to the students to determine the participants' characteristics and their views on reading blogs at the beginning and end of the semester. The initial items in the survey included basic demographic information: Gender, Age, First language, Years living in the U.S. Next, several questions targeting the students' views on reading and blogs were asked:

How would you describe your confidence as a reader in English?

When you read in English, which one of these describes your reading rate (reading speed)?

How would you describe your experience this semester with blogging?

Several more open-ended completion statements were given next for the participants to complete:

I think reading in English is _____.

Reading in English for me is _____.

Being able to read well in English is _____.

When someone asks me a question about something I have read in English,
_____.

Please indicate your favorite book in English:

Places for open comments on reading and blogging were also provided:

Please use this space to give other comments about your view of reading in English.

Please give other comments about your view of Blogging in the Reading class.

The results of the learner survey confirmed that a majority of the EAP readers increased in confidence, felt better equipped to engage with and analyze reading materials, and recognized the benefits of reading and of blogging in support of reading. First, about 48% of survey respondents indicated they had increased in confidence as readers as a result of reading and blogging about reading throughout the semester. About 36% of the students also felt that reading in English had become easier for them by the end of the semester.

The value of blogs in the context of a reading class was also supported in the survey results. Based on the responses, over half (about 52%) of the students had either rarely or never used blogs before the Reading course. This fact may not be surprising when one considers that many of the students in the EAP courses do not have a strong background in technology use, either because of lack of access to technology or because of inadequate familiarity with some academically-oriented technological applications.

By the end of the course, about 56% of the students indicated they were either somewhat likely or actively planning to blog on their own. Fully 64% of students reported that blogging helped them understand their classmates' viewpoints more fully. In a related finding, about 52% felt that blogging about what they were reading increased their sense of audience, a concept covered in the Reading courses.

In addition to the definite survey responses, the more open-ended learner answers revealed the ways in which blogs created a strong sense of community and rapport among the students. The earlier discourse analysis results of the blogs were confirmed in the students' self-reports. For example, Min comments in her survey at the end of the semester, "Blogging is a [sic] interesting part of reading class. I like to compose blog and read others' feedbacks. Also, I enjoy my reading group sharing ideas about books on blogs." Min's appreciation for the intersubjectivity promoted by reading blogs is evident in a number of other students' open-ended survey responses as well.

The potential for blogging to enhance students' self-expression is likely due in part to the less intimidating nature of blogs in comparison with more formal book reports. This perspective is reflected in some of the students' own survey responses. For example, Dona (L1 Spanish, female) indicated in response to the survey item: *Please give other comments about your view of Blogging in the Reading class*, "I felt that that informal blogs where more enjoyable then the formal blog. Because there was not stress about doing the blogging [sic] right or wrong."

There is also evidence in the survey responses in support of the idea that blogging can contribute to students' attention to details in the material that they are reading. For example, Vedika (L1Punjabi, female) noted in her comments on the student survey about blogging that, "it is really helpful in making your writting [sic] better, paying more attention to every detal [sic] in the book." If blogging is perceived by students as a tool for increasing one's awareness of and attention to the details of reading, this reality would add to elements such as audience and intra-group communication to recommend blogging as a valuable tool to promote critical reading among second-language learners.

DISCUSSION AND CONCLUSION

The discourse analysis of students' blogs confirms our assumption that blogs on reading can enhance students' critical reading. Newman, et al.'s (1995) adapted indicators were used to describe student's critical thinking and reading skills. The comparison between the discourse of students' initial blogs at the beginning of the semester and that of their final blogs near the end of the semester shows that students offer more important ideas for interpretation and critical assessments in their final blogs. Their final blogs also demonstrate increased complexity and expression of subjectivity and intersubjectivity. These findings support Newman, et al.'s (1995) claim that online discussion elicits more important statements and linking ideas than face-to-face communication.

The usefulness of Newman, et al.'s (1995) adapted indicators can be evaluated by examining the ability of the framework to facilitate the identification of important phenomena in the activity of students in the learning process. As Newman and colleagues point out, "In our transcripts, we found few obvious A+-, P+- or W+- statements" (p. 74). They go on to identify a possible cause for the finding and offer advice on the circumstances under which some indicators may be eliminated from the framework: "This may be an effect of the nature of the student task: general discussion rather than the more specific problem-solving activities. But if others find the same in other learning situations, these indicators should be dropped" (p. 74). Essentially, the authors offer future researchers guidance on using such an evaluative framework. Namely, the categories included and concepts outlined need to be applied on a case-specific basis so as to ensure the maximum utility of the system. This approach is consistent with the evaluation of Newman's method offered by Landis, et al. (2007).

Besides the positive effects of the use of blogs on students' critical reading, we also observed a strong sense of learning community being built through blogging. This is consistent with Hsu and Wang's (2011) finding that blogging activity enhances classroom rapport. From the comments students leave on each other's blogs, we observe students giving

praise, showing agreement/disagreement, or offering practical advice to their classmates. This sense of community is also confirmed by their survey responses at the end of the semester.

In terms of the development of *multi-literacy*, as defined by the New London Group (1996), blogs promote overall literacy and reading confidence in the context of new media, including socially-oriented media modes such as blogs. It is important at this point in the discussion to recall that multi-literacy today refers not only to the ability of learners to negotiate texts presented in a variety of online and offline modes, but also to their capacity to adapt to the proliferation of cultural shifts and interactions that online discourse fosters. Reading in a multi-literacy sense, then, is a complex process through which students are equipped to read texts, either on paper or via a screen (e.g., tablet, e-reader, laptop, or others), and to discuss and share their views regarding what they read using socially-oriented media. Blogging appears to support both major aspects of this process.

The findings of our own research suggest that blogs can be effectively employed in the reading class to enhance students' critical reading. In our application of blogging, we did not give students specific guidelines to avoid restrictions on students' thoughts, but some students had a vague idea on what to write in their blogs. Many of them summarized more than analyzed the novels in their blogs, which could explain the relatively small number of critical thinking tokens in our analysis, although these tokens did increase over time. In future implementation, we could set more specific guidelines or ask comprehension questions at the beginning of the semester to encourage students to write more on their thoughts. Once they get used to sharing opinions on blogs, we can reduce the guidelines to allow students to express their views more freely.

The level of sharing should also be considered when employing blogs in class. We used the blog function within the course management system (Desire to Learn, D2L). Although the blogs are visible to all registered students on campus, few readers outside the students' Literature Circle groups would be likely to read the blogs, which may affect students' motivation. To increase students' motivation and to build a stronger sense of audience, some popular blog sites (e.g., Blogger, Blogspot, <http://blogger.com>, © 2012 Google; or Wordpress, <http://wordpress.org>, © 1991 Free Software Foundation, Inc.) could likewise be employed in the classes.

A concluding word concerning the future of discourse analytic (DA) research in the context of research into multi-literacy and modern ESL reading instruction draws the strands of our chapter together. It is hoped that among the lessons that will be drawn from our discourse analysis of reading blogs is the potential of targeted blogging to expand and sustain independent reading and critical thinking through the promotion of online discourse about reading among peers and to the broader community. We recommend that future research and application in this area focus on the areas in which the social and pedagogical functions of blogs intersect, facilitating both meaningful interaction concerning reading and the development of critical reading capacity in language learners.

Chapter 39

A DISCOURSE ANALYSIS ON THE MITIGATION LANGUAGE USED IN THE SUPERVISION OF COLLEAGUES

İrfan Kuran*

Kocaeli University, Faculty of Education,
ELT Department, Kocaeli, Turkey

ABSTRACT

Research into the general nature of the supervisory process in language education has recently gained popularity. This chapter includes the examination of the analysis of the mitigation discourse found in the supervisory interaction between two graduate students. To illustrate the submerging patterns of mitigation I will examine the nature of the supervisory feedback sessions I provided for two classmates, one of whom teaching ESL and the other Chinese at undergraduate level, focusing on the effects of such devices observed in the transcripts of the two post-observation conferences held with the latter. Findings of this study discussed in this chapter recommend that mitigation be used as a strong pedagogical tool for the professional development of practicing and student teachers.

INTRODUCTION

This chapter looks into the discourse patterns found in the process of supervising two colleagues/classmates in terms of the mitigation language used by the supervisor. It is based on the language used during the pre and post observation conferences held as part of a graduate course about teacher supervision with the two teachers whose classroom instruction was observed by the author. Brad Watson and Shuei Li are the two pseudonyms used in reference to the two classroom teachers and colleagues I met during a term I spent at a graduate program in The USA as an exchange student. I observed Brad once and Shuei Li

* Corresponding Author Email: irfankuran@kocaeli.edu.tr.

twice. The whole process promised to be an interesting experience right from the start in that one of them was a NSET teaching an ESL class at the IEP program of a State University in The USA and the other one a native speaker of Chinese teaching her L1 to an undergraduate class at the same institution. I had concerns at the beginning about having to observe a class taught in a language I did not speak. But I thought it would also allow me to focus more on the other aspects of teaching and teacher behavior.

With both teachers I held pre-observation and post-observation sessions. My American supervisee was quite comfortable with being recorded during all stages of the supervision process while the other one expressed concern about being audio-taped during the pre and post observation sessions saying that it was not compulsory for the former and not really necessary for the latter. I sympathized with her concern about the taping of the pre-observation session but I had to record at least one of the two post observation sessions as required for the study reviewed in this chapter. I believe this difference can be attributed to cultural and personal differences, but it did not prevent me from having a try. After all, as Bailey (2006) points out, these days language teacher supervisors are called on to work with teachers from a wide variety of linguistic and cultural backgrounds and it would likely have positive and negative consequences.

I tried to execute my observation in such a way that it would prove to be what Gebhard (1999) defines a “nonjudgmental description of classroom events that can be analyzed and given interpretation.” I avoided judgmental behavior particularly during the feedback sessions, which had been one of my weaknesses during similar sessions with the pre-service teachers I supervised at my home teaching situation.

Observing two different classmates enabled me to compare the differences between the possible amounts of distance between the two parties of the supervision process as well as examine a variety of reactions to my attitude as a supervisor. For instance, Brad was very much in control of his situation and displayed a significant amount of power during all the stages of the process by offering me copies of the recordings he had been planning to perform as well as asking me to execute the supervisory feedback session within the next 24 hours after my classroom observation. On the other hand, his use of initiative, which I interpreted as one of his possible strengths as a teacher during the pre-observation session, was not balanced with his ability to involve all the students in the classroom activities during my observation. He seemed to keep his distance from his students as an authority figure rather than maintain the profile of a powerful and interactive teacher. He depended more on his time management skills and kept the class moving smoothly but he did not seem to have much of a rapport with the class. They did all he said but they did not seem to enjoy themselves. In my opinion, language learning is supposed to be communicative, informative and fun. But there was no element of fun in the air, the reason for which might have been his health situation with his throat. If I had the chance of observing him one more time, I would certainly supervise him about this aspect of his performance as I believe he has all that it takes to be a fun teacher thanks to his jolly nature.

Unlike Brad, Shuei Li was a little tense during the two pre-observation conferences and made it clear by expressing her dissatisfaction with my attempt at recording those sessions. But other than that, she was very cooperative and confident especially during her classroom instruction and the post-observation sessions. However, she seemed to keep the pre-observation sessions as short as possible. Looking back now, I relate this to her excitement before the event.

As a non-native speaker, she gave me the chance of witnessing a different approach to teaching as compared to NSETs. Medgyes (2001) refers to this difference arguing that non-native-speaking teachers adopt a more guided approach, are more cautious, are more empathetic to the students, attend to real needs, and have realistic expectations.(as cited in Bailey, 2006, p.308). That indeed was the case because I had observed that Brad as NSET did adopt what Medgyes defines a more flexible, more innovative... and frequently more casual approach (ibid.). I have decided to focus on Shuei Li's performance in this paper since I believe she, as a NNSET, offers better prospects having similarities to my target audience at my home teaching situation, where I supervise NNES pre-service teachers. Her performance displayed a lot of positive changes since our feedback session. First of all, she increased her use of L2 in her instruction and made sure the students understood what she was saying by asking them comprehension check questions in L1 and L2. Another improvement with her teaching behavior was her continuous attempt to involve every student in the classroom tasks. She achieved this goal by walking toward them and mildly insisting on eliciting a response from them. Fortunately, the students were very responsive despite the fact that it was the final lesson of the semester before the final exams. Almost all the students seemed to be eagerly participating in the activities and following the teacher's instructions carefully. Shuei Li used more social chit-chat phrases, thus offering her students a spoken flavor of the target language. She remembered to praise them every time they made an effort and this seemed to provide the students with encouragement to do better.

Her classroom management skills were good and she did very well in terms of realizing her lesson plan. The lesson flowed very smoothly and it did not sound like the last of the semester. Both the teacher and the students were enthusiastic and performed well.

THE DISCOURSE ANALYSIS OF THE TRANSCRIPT

Wajnryb (1995) defines *Mitigation* as the linguistic means by which a speaker deliberately hedges what he / she is saying by taking into account the reactions of the hearer (as cited in Bailey, 2006, p.189). I am going to first analyze the transcript (you can refer to Appendix IV for the whole transcription) according to three major types of mitigation in supervisory discourse she describes as: (1) *hypermitigation*, meaning there is so much mitigation the message is overly softened, often at the expense of clarity; (2) *hypomitigation*, meaning there is too little mitigation and the message is so direct as to be blunt; and (3) *above-the-utterance-level mitigation*, meaning the softened criticism is accomplished at the discourse level (ibid.:166). Later I will examine and discuss in detail the types of utterance level mitigation used in the feedback session.

Hypermitigation Devices

There is none as I was aware of the significance of not being too indirect in putting across to the supervisee some negative feedback. I was lucky in that my supervisee was one of my best classmates and she herself had asked me to observe her in the first place. I knew that I would not have to be too indirect to express any negative criticism for fear of performing a

face-threatening act. And then again there was not much to criticize as the teacher seemed to have followed my advice about such issues as increasing her use of L2 and the variety of social chit-chat phrases and expressions even drawing the attention of the reluctant students, whom she mostly expected to act sensibly as college students, by directing comprehension check questions and attention checking.

Hypomitigation Devices

They are almost non-existent as I was determined to avoid acting the supervisor Wajnryb (1994a) refers to as “up-front, blunt and totally frank”. The closest I might have come to the level of hypomitigation could be the point where I indirectly criticized the teacher for not doing much on the reluctance of certain students and say “Oh, I would definitely do something about it. I mean their attendance and behavior. I wouldn’t ignore their reluctance and would definitely try to involve them in all the activities”. The message is indirect but clear and therefore it runs the risk of threatening the face of a teacher with whom one may just have a formal relationship. Another example is when I asked my supervisee how many of the students she would fail. But it was not a question criticizing a negative behavior. I was only being a little nosy as we teachers do not usually announce to others the number of students we will have to fail.

Above –the-Utterance- Level Mitigation Devices

Example: “I wish I were one of your students in this class. But not everybody was so enthusiastic, I’m afraid. I mean the two Asian American guys at the back.” Here I prepare the supervisee for the forthcoming negative feedback by expressing my admiration for a positive side of her teaching.

Utterance-Level Mitigation Strategies Used

Wajnryb classifies three main types of mitigating strategies as syntactic, semantic and indirect and what follows are examples from the transcript (I should note that no instance of the use of indirect mitigation strategies has been observed).

a. Syntactic Mitigation Devices Used

Tense shift: “would you change anything about your teaching style, the textbook you use or anything?”

Negating: “I wouldn’t ignore their reluctance”.

Interrogatives: “Why do you think some of them have been so irregular in their attendance?”

“What about their performance in the oral sections?” “How are you planning to teach the course next year?” “I mean, would you change anything about your teaching style, the

textbook you use or anything?” These questions all suggest alternative practices, which might as well have been tried by the teacher, rather than directly mention those alternatives as possible solutions.

Modal verbs: “I would definitely do something about it” “I wouldn’t ignore their reluctance and would definitely try to involve them...”, “Would you change anything about your teaching style?...”

b. Semantic Mitigation Devices Used

Wajnryb’s main semantic mitigation strategies for mitigating direct utterances and examples from the transcript are as follows:

Qualm indicators/Hesitation markers: “You know, we teachers kind of know who is likely to pass or fail...”

Delaying asides: “I wish I were one of your students in the class, too. But not everybody was so enthusiastic, I’m afraid.”

Lexical hedges/Metaphorical lexemes: “Well, you can’t learn much unless you do what it takes” with the hidden message that teachers should somehow get their students to make an effort to learn through various techniques.

Style shifting: “Well, you can’t learn much unless you do what it takes.” This example includes the use of impersonal “you”, which creates an informal and indirect effect.

There normally are more subcategories under Semantic mitigation strategies but I do not seem to have used them in abundance, which suggests that I preferred being more direct than indirect, which my supervisee also observed and verbalized to me during our post observation session as can be seen in the transcript. But my directness was carefully worded and it benefited from the informal relationship I had with my supervisee outside the classroom.

Furthermore, I practiced utmost attention to not threaten my supervisee’s face and encouraged her to reflect on her own professional skills in a cooperative atmosphere. In terms of the Johari Window named after its creators, Joseph Luft and Harry Ingram (1969) I tried to help her to move from the blind self quadrant to the open self quadrant in terms of her weaknesses (as cited in Bailey, 2006, p.38).

CONCLUSION

In this paper I have discussed the outcomes of the supervision I have provided for two of my classmates focusing on one of them in depth in terms of the mitigation strategies I used and all the insight I gained out of the process as an experienced practicing supervisor. I have had the opportunity of developing my own professional skills by experimenting with constructs such as pre-observation conferencing and cooperative and non-directive supervision. I also became aware of the importance of listening to the supervisee as well as of providing them with advice for professional development. I also realized that the supervisees benefit much more from the supervisory process if they are encouraged to discover their own strengths and weaknesses through carefully worded input including various forms of

mitigation accordingly. This new perspective into supervision helped me to discover my own strengths and weaknesses as a supervisor.

Throughout the entire supervisory process with both classmates my priority was to perform a non-directive performance as I came to understand that it was the most viable option allowing more opportunities for professional development for both participants. I followed the argument offered by Bailey (2006) that in the non-directive approach, supervisors' responses to teachers' ideas should not be to agree or disagree immediately but to encourage teachers' reflection and draw out further ideas based on that reflection, which was something that I had not considered before with the pre-service teachers I supervised and I tended to be very judgmental of their performances believing that direct criticism would save us time and energy and accelerate the supervisees' professional development. This time I avoided judgmental comments and tried to establish a close interaction with my supervisees in an effort to allow room for reflective supervision. My guiding principle in this endeavor was Sergiovanni's (1985) argument that teachers and supervisors must join forces "in trying to make sense of complex situations, in sharing perceptions, and in arriving at 'treatments' and other courses of action together" (as cited in Bailey, 2006, p.332).

I have every intention to put into practice all the outcomes of this supervisory experience and hope that both my pre-service teachers and I will be benefiting highly from this experience. There is a lot of potential in the application of such analysis also for those supervisors out there who need to improve their performance and want to have a hand in the professional development of their colleagues and student teachers.

APPENDICES

Appendix I: Observing an ESL Class with Brad Watson

After a friendly and relaxed pre-observation session at the Graduate Teaching Assistants room of the Applied Linguistics Department, I have arranged observing a full ESL lesson with Brad Watson, a classmate from my Teacher Supervision course at an American State University. I was planning to audiotape the pre-observation session as well as the class observation itself. When I raised the issue, Brad said that it would not be a problem for him as he himself would videotape his lesson to be observed and that he could provide me with a copy of the recording if I wanted to have one, which was very relaxing. His trust in himself and me was very comforting. Walen and DeRose (1993) argue that trust is the foundation for productive communication and opens the door for self-evaluation (as cited in Bailey, 2006, p.189).

Brad taught a low intermediate level reading class of 12 students in their early 20s; 8 Saudi Arabians, 1 Greek, 1 Korean, 1 Chinese and 1 student from Kongo. I started audio-taping the class and taking detailed field notes along the way.

He started his class with a warm up session talking about the quiz results for about a minute and mentioned his sore throat asking them to be tolerant toward the quality of his voice. From the way the students responded to this, I inferred that he had created a friendly relationship with the class. He projected an image of food on the screen about the use of

chemicals in food processing and asked if they were familiar with Asian food with a few students answering eagerly, which took about two minutes.

He then moved onto an activity based on some flashcards which the students had apparently been given in the previous class. He asked them to return them. While they were doing so, he checked their work praising them. The flashcards were supposed to be filled with additional sentences about various food items.

In the next stage he asked them to share their sentences with a friend and then invited a female student to the board to share her sentences with the rest of the class. He modeled a sample interaction with her about the ingredients of some food from her flashcard. After checking their understanding of the procedure, he asked the students to stand up and pair up with somebody with the same color shoes and role-play similar interactions. The students did this a bit reluctantly, which in my opinion might have been due to my presence in the classroom. While they were carrying out the task, he listened to them closely by standing near and praising them. He then got two pairs at the board to do it for the rest of the class and expressed his satisfaction with their performance. At this stage, almost all the students seemed to be actively involved by either doing the activity or listening to those performing at the board except for a Saudi boy in the back of the room.

Students returned their flashcards and the teacher asked them to put away their cell phones as it was time for the quiz. Receiving their quizzes, the students started dealing with them quietly with a few occasional students approaching the teacher's desk to ask for a few clarifications. Ten minutes later, the students received the second part of the quiz when one of them mentioned some discrepancy with the instructions and the teacher explained it to the whole class thanking the student.

After the timely completion of the quiz, they moved onto checking the answers by looking at the questions on the screen. The teacher got individual students answer the questions and wrote the answers in the gaps. He read them aloud very clearly despite the problem with his throat, which was worthy of notice.

After the quiz check, the teacher handed the students an article entitled "Chinese food syndrome" asking them to read it and mark the unknown words. He then asked them to make an original sentence about the main idea and prepare three "Why" questions about the text. Receiving a question for task clarification from a student, he did that making sure everybody understood it.

After a comprehension question was answered by a student, the class worked on the article for three minutes with the teacher closely monitoring their performance. After an extra three minutes granted by the teacher, they were asked to tell him about the words they did not understand. The problem words were explained by the teacher and various students.

For the last five minutes of the class time the class got into two large groups and shared their "Why" questions with each other. When one of the groups experienced a problem the teacher dealt with it and let the other group hear his explanation by saying it out loud.

The teacher called time and assigned homework by drawing everybody's attention on the screen. Before the class left, he handed out their previous works.

The first thing that attracted my attention about Brad's style of teaching was his precision with time management. He smoothly followed his lesson plan without causing any gaps and handled questions confidently in spite of a sore throat. The way he reflected individual student feedback to the rest of the class was also one of his strengths.

What seemed to be missing from the atmosphere was the lack of enjoyment in the classroom. Knowing the relaxed and jovial nature of his, I must admit that I had expected a more fun class with enthusiastic student participation. The students did participate but there was a lack of enthusiasm in their participation. If Brad had not told me that it was a very relaxed class and my presence would not affect their performance at all, I would not have worried but it was the case.

I guess Brad should depend more on his inter-personal skills that he exhibits outside the classroom. His students would highly benefit from his relaxed manners and use of colloquial expressions which, he could perfectly adopt as a native speaker. Such a change in his instructional behavior might help his students to relax as well. As a result, they would likely get more actively involved in the activities and progress more.

Appendix II: Observing a Chinese L2 Class with Shuei Li

Observation I

April 10, 2013

I observed Shuei Li twice teaching Chinese to an undergraduate class of 20 students. The original class population was 24 but there were drop-outs, hence the present number. It was an all skills class with special emphasis on writing due to the distinctive writing system used. Both lessons were audio-taped and followed by post-observation conferences.

When I entered the class, she had already started delivering some hand-outs to the students. The atmosphere was relaxed and friendly. The teacher mostly spoke in English and occasionally used Chinese while interacting with the class. I soon noticed that the handouts were related to the quiz they were given the previous week and they were checking their answers to the quiz questions together.

The teacher asked who had certain Chinese words on their handouts for the English words she called and put the students having the same words into pairs to make sentences with them. When their sentences were ready, they shared them with the rest of the class by reading them aloud. During the activity the teacher attended the students closely and answered their questions in English. What attracted my attention at this point was that she did not share the outcome of this interaction with the rest of the class. The good thing was that all the students were actively involved. Her attitude to the other pairs checking their work closely and answering all their questions attentively gave me the impression that she had a good rapport with the class. Three minutes later the teacher had groups of students read their sentences aloud with the whole class repeating after them in chorus. She remembered to praise the groups in L1.

As the next activity the teacher displayed a dialogue about ordering food on the screen and had the whole class repeat the lines from the dialogue in chorus. The students joined in eagerly.

After that the teacher mentioned an assignment about the students' sending her e-mails about their favorite food expressing her dissatisfaction that not many students had replied. Next up was a listening activity which required ordering the sentences heard in the recording. She warned the students not to look at the script in L1 and praised them saying "Good Job" again in L1 when they carried it out successfully. The teacher then allowed them to check their answers against the text and a chorus repetition followed.

The following task was a pair work activity in which students chose one of the four alternative dialogues in their handouts and practiced it with their partners. The instructions, which were given in L1 again, were eagerly followed by the students. Afterwards the teacher chose a particular pair to role-play their chosen dialogue at the board, which they did well and got warmly praised by the teacher and the whole class. One of the pairs at the board included a quiet, usually reluctant looking male student, who rendered the dialogue very well and the class liked their performance very much particularly because of the quality of his voice as I understood from the comments made by the other members of the class.

Next up was work on a study guide and a worksheet about the upcoming final quiz. The class started working on them immediately. The teacher then put some incomplete rules on the screen and asked the students to work them out. The class responded eagerly and the rules were completed successfully.

The next stage of the lesson was devoted to reading, which was carried out through handouts with a passage and comprehension questions. The teacher asked the students to work on them on their own and monitored them closely by answering the questions she was asked by individual students. In the mean time she kept praising them in L1 and L2. She also asked them to write their names on the back of their handouts, which she said was going to help her check their attendance. I found her approach to checking the attendance very practical.

The last section included students' Powerpoint presentations on Chinese culture. The teacher asked for some volunteers to deliver their presentations and three students volunteered to do so. It was a presentation about Chinese education system and was made in L1. The content was quite interesting and led to some comparison between the American and Chinese systems. Despite the quality of the content the presenters seemed much too relaxed and even indifferent to what they were doing.

After the presentation the teacher thanked the three students and gave the class their quiz papers back and the class concluded.

Appendix III: Observing a Chinese L2 Class with Shuei Li

Observation II

April 23, 2013

When I entered the room for the second half of the lesson, the whole class was listening to the teacher very carefully. She was speaking Chinese and asking questions about the images of various clothing items on the screen. Whenever the students had difficulty answering, she helped them in L1 and L2.

She put different Chinese characters on the screen and directed questions to the individual members of the class. They were fully involved listening to her very carefully. One of the questions directed to a male student was about a pair of boots and he hesitated for a while. The teacher helped him put a sentence together and he seemed to be relieved.

Later the teacher moved onto the exam practice asking the class to find two partners and form groups of 3. She provided them with handouts containing model questions they were likely to answer in the written final exam. Except for two Asian-American male students in the back they all did that started working eagerly. The two students remained silent for a

while and then somehow started working on the practice questions, too. The teacher monitored each group closely and gave them immediate feedback.

About three minutes later the teacher displayed the oral interview schedule on the screen asking the class to consider changing their original slots as she would be busy presenting her MA graduation presentation to her Department. The students offered alternatives and it was settled in an orderly manner.

Next the teacher asked them to take out the previously handed model oral interview questions and practice them with a partner for the next five minutes. She said that she was ready to answer any questions they had. After a while the teacher displayed 10 sample interview questions on the screen. Most students started working on their own with a few others working together in small groups. The teacher walked about the classroom dealing with individual problems. While almost the entire class was busy with this, the two boys in the back enjoyed their private conversation. On noticing their indifference, the teacher directed a few questions to one of them conducting an interview about his major. To my surprise he was able to answer her questions and we learned that there was no equivalent for it in Chinese.

The teacher then called for the attention of the class, explained a few important aspects of the oral interview in L1 and went onto asking individual practice questions. Later she reminded them of the oral interview task of reading a passage aloud and answering questions about it. She showed them a sample reading text on the screen, started reading it aloud with the whole class joining her except for the two students in the back. After this the teacher asked them to turn to a certain page in their text books for a narration. She passed handouts to the class and asked them to get into pairs for a gap-filling activity about the same reading text. They started work with the teacher closely monitoring them. At this point I was pleasantly surprised to see that even the two students in the back were doing the task individually.

After this activity the teacher asked them to move onto a speaking activity in their handouts. The students tried to fill out the gaps in a dialogue individually and they were called on to read their answers aloud.

The teacher concluded the class and asked the students in L2 not to be late for their oral interviews, which they seemed to have understood. One of the students asked her in L1 where the oral interview would be held. In response the teacher displayed the required information on the screen while most of the students were leaving the classroom.

Appendix IV: The Transcript for the Post-Observation Conference with Shuei Li after the Second Classroom Observation

In the following transcript S stands for the supervisor (me) and T represents the teacher (Shuei Li).

S: Hi Shuei Li, ready for the feedback session?

T: Yeah, let's do it but please don't record it.

S: You know that I have to but OK, as you like it. I'll take notes then. Right, let me first share with you my observation notes. When I entered the class everybody was all eyes and ears listening to you. You mostly spoke in Chinese and they seemed to follow you without much difficulty. It was the exam practice you mentioned during the pre-observation session right?

T: Yes. As their proficiency level is not high, I had previously given them 30 questions likely to be asked so that they would not panic in the exam. I only made a small percentage of them into exam questions but the result wasn't very promising. We then agreed to decrease the number of questions to 10 but they would have to study transcribing and memorizing them all, which I thought would be harder but it seems to work better. Yes, that's what we were working on when you entered the room.

S: I see, and I liked the way you code-switched while interacting with them this time and it seemed to work well. Even I was able to pick up a few words of Chinese from the context.

T: Really? Great!

S: Yes, of course. I wish I were one of your students in the class, too. But not everybody was so enthusiastic, I'm afraid. I mean the two Asian-American guys at the back.

T: You're right. You know what? I had been teaching at college level for three years in China before this job and my students always worked hard and participated in the class doing their best. I expect my students here to act like college students and I don't really warn them about their behavior.

S: Oh, I would definitely do something about it. I mean their attendance and behavior. I wouldn't ignore their reluctance and would definitely try to involve them in all the activities.

T: Yes, of course. You are very experienced. One of the two most experienced students in the (supervision) class actually and your observations are very sharp.

S: Sharp? What exactly do you mean by that?

T: I mean you observe very carefully. You do it so professionally. You do not miss anything and your comments are always to the point.

S: Oh, are they? I am glad to hear you say that. What about the other students in the class? Why do you think some of them have been so irregular in their attendance?

T: Most students take Chinese just to complete their credits. Some of them are heritage students and they speak Chinese with their parents at home. They are very fluent with the language but they don't do well in the exams. Another thing is that they are stuck between two cultures. 6 students dropped out of the course already and a few others have been very irregular, thus missing a lot of instruction. The two students in the back are clear examples of this attitude.

S: But they can at least read and understand the Chinese characters. I find it a good achievement. It must have been very hard for them to get used to the writing system. You must be proud of yourself.

T: Oh, thank you. When they failed the reading sections in the initial quizzes, I prepared new reading texts for them to study in order to improve their performance. We studied them together and it seems to have worked.

S: What about their performance in the oral sections?

T: Well, nobody fails the oral interview. We have practiced certain skills previously such as reading aloud, introducing yourself and the like, and they are good at them. They only want to speak the language, they don't want to read or write.

S: Why is that?

T: Well, most of them taught that it would be an experience similar to learning Spanish. Can you believe it? They had no idea what it was actually like.

S: Then why did they choose to study it in the first place? I mean they could have done other courses or languages for their credits, couldn't they?

T: Because of their ignorance. As I said, they just wanted to complete their credits and the heritage students chose it thinking that it would be so easy for them to pass the course.

S: How many of them are likely to fail? I mean have you decided yet? You know, we teachers kind of know who is likely to pass or fail according to their general performance and attitude.

T: Well, 10% of the student population is failing due to their lack of attendance already. I haven't finished marking their papers yet so I don't know.

S: How are you planning to teach the course next year? I mean would you change anything about your teaching style, the textbook you use or anything?

T: There won't be a next year. I am graduating, you know. I have already made certain changes about my teaching, anyway. I have focused more on speaking skills but some of them didn't like it. One of the students even questioned my teaching skills.

S: Really? Well, you can't learn much unless you do what it takes.

T: Absolutely.

S: Thank you for allowing me to supervise you, Shuei Li. It was a great pleasure for me to work with you.

T: Sure. The pleasure is mine. I enjoyed it, too.

Chapter 40

**A COMPARISON OF THE CORRECTIVE
FEEDBACK PATTERNS OF NATIVE AND NON-NATIVE
SPEAKING TEACHERS OF ENGLISH:
TURKISH AND AMERICAN ELT SETTINGS**

Banu İnan*

Kocaeli University, Faculty of Education, ELT Department,
Kocaeli, Turkey

ABSTRACT

Learner errors and how course instructors should react to these errors have been studied extensively by many different people up to now. This aim of this chapter is to compare and contrast the basic corrective feedback patterns used by native and non-native speaker teachers of English in two different ELT settings, a Turkish and an American EFL setting. Classroom conversations of one native (NS) and one non-native speaker (NNS) teacher of English from Turkish EFL setting and one NS and one NNS teacher of English from American ESL setting in reading-based courses were video-recorded for four weeks and they were transcribed by the researchers. The findings of this chapter indicate that NS teachers of English are more tolerant about learners' spoken errors than NNS teachers of English but they try to correct as many pronunciation and lexical errors as possible. On the other hand, NNS teachers of English do supply corrective feedback for lots of grammatical errors but they are not as sensitive as NS teachers of English about the pronunciation and lexical errors in both contexts.

INTRODUCTION

There has been considerable amount of research on feedback in the last few years. The data gathered as a result of the research have exemplified different issues related to feedback. A part of the research investigates what type of learner error is corrected and in what ways (Chaudron, 1977; Fanselow, 1977; Sheorey, 1986; Lyster, 2001; Morris, 2002a & 2002b), another aspect of the research is associated with the effect of different feedback types on learner performance (Guntermann, 1978; Carroll et al., 1992; Dekeyser, 1993; Lyster & Ranta, 1997; Leeman, 2003; Lyster, 2004; Ammar & Spada, 2006). A third but less extensively studied dimension of feedback-related research is about the differences of corrective feedback according to teacher variables such as gender (Lee, 2002), and experience (Yoneyama, 1982). Allright (1975) points out that research on teacher feedback supplies information about how effective teacher's interaction is and how language learning takes place. Most of the research above is based upon the idea that comprehensible input, by itself, is not adequate to explain the complex phenomenon of second/foreign language acquisition; negative evidence (i.e., information about ungrammaticality) is also an important requirement (Panova & Lyster, 2002), which will enable learners to identify the differences between their actual productions and the original forms in the target language and to modify their interlanguage accordingly. One of the most influential ways of supplying this negative evidence in the classroom is through corrective feedback.

As suggested by Chaudron (1977, p.31), *corrective feedback* refers to “any reaction of the teacher which clearly transforms, disapprovingly refers to, or demands improvement of the learner utterance”. Lyster & Ranta (1997) developed a “corrective discourse model” based on this definition of corrective feedback. This model consists of three moves, which are: (a) error, (b) feedback and (c) learner uptake. Error is the utterance which is not well-formed. In Lyster and Ranta's classification, feedback is examined in six groups, which are exemplified below – (a) explicit correction, (b) recast, (c) clarification requests, (d) metalinguistic feedback, (e) elicitation, and (f) repetition. Learner uptake, in this model, “refers to a student's utterance that immediately follows the teacher's feedback and that constitutes a reaction in some way to the teacher's intention to draw attention to some aspect of the student's initial utterance” (Lyster & Ranta, 1997, p.49). Uptake was considered to be either an indicator of how effective corrective feedback is (Chaudron, 1977) or as an aid for learners to notice the gap between the target form and their interlanguage form (Mackey et al., 2000). Lyster and Ranta (1997) identify two types of uptake, which are “*repair*” and “*needs repair*”. In repair, learner error is corrected with the help of corrective feedback, whereas in needs repair, corrective feedback does not bring about the correction of learner error. A number of researchers also focused on the concept of “uptake” and its role in the process of language acquisition. Lyster & Ranta (1997) contend that learners are able to practise using language items by means of uptake, which may lead to their automatic retrieval, Ellis, Basturkmen and Loewen (2001) suggest that uptake may be facilitative of acquisition.

In the corrective feedback model suggested by Lyster & Ranta (1997), the error treatment sequence is as in Figure 1.

Figure 1. Error treatment sequence by Lyster and Ranta (1997).

CORRECTIVE FEEDBACK TYPES

The following corrective feedback types and their definitions were taken from Lyster & Ranta (1997) and the examples are from 10-11 year-old students in an ESL class (Lightbown & Spada, 2006, p.126-127).

Explicit correction refers to the explicit provision of the correct form. As the teacher provides the correct form, s/he clearly indicates that what the student had said was incorrect (for example, ‘Oh, you mean...’, ‘You should say ...’).

S The dog run fastly. (*student error*)

T 'Fastly' doesn't exist. 'Fast' does not take -ly. That's why I picked 'quickly'. (*explicit correction*)

Recasts involve the teacher's reformulation of all or part of a student's utterance, minus the error. Recasts are generally implicit in that they are not introduced by 'You mean', 'You should say', or 'Use this word'.

Clarification requests indicate to students either that their utterance has been misunderstood by the teacher or that the utterance is incorrect in some way and that a repetition or a reformulation is required. A clarification request includes phrases such as 'Pardon me...?' It may also include a repetition of the error as in 'What do you mean by...?'

T How often do you wash the dishes?

S Fourteen. (*student error*)

T Excuse me? (*clarification request*)

S Fourteen.

T Fourteen what? (*clarification request*)

S Fourteen for a week.

T Fourteen times a week (*recast*)

S Yes. Lunch and dinner.

Metalinguistic feedback contains comments, information, or questions related to the correctness of the student's utterance, without explicitly providing the correct form. Metalinguistic comments generally indicate that there is an error somewhere (for example, 'Can you find the error?'). Also, metalinguistic information generally provides either some grammatical terminology that refers to the nature of the error (for example, 'it's masculine') or a word definition in the case of lexical errors. Metalinguistic questions also point to the nature of the error but attempt to elicit the information from the student (for example, 'Is it feminine?').

S We look at the people yesterday. (*student error*)

T What is the ending we put on verbs when we talk about the past?
(*metalinguistic feedback*)

S e-d (*learner uptake*)

Elicitation refers to at least three techniques that teachers use to directly elicit the correct form from the students. First, teachers elicit completion of their own utterance (for example, 'It's a ...'). Second, teachers use questions to elicit correct forms (for example, 'How do we say x in English?'). Third, teachers occasionally ask students to reformulate their utterance.

S My father cleans the plate. (*student error*)

T Excuse me, he cleans the ??? (*elicitation*)

S Plates?

Repetition refers to the teacher's repetition of the student's erroneous utterance. In most cases, teachers adjust their intonation so as to highlight the error. In the following example, the repetition is followed by a recast.

S He's in the bathroom. (*student error*)

T Bathroom? Bedroom. He's in the bedroom. (*repetition*)

Multiple feedback includes more than one type of feedback supplied by the teacher as a result of the students' erroneous utterances.

Among all these types of feedback, *recasts* are one of the most commonly studied types of corrective feedback in different settings such as L1 acquisition (Farrar, 1992; Saxton, 1997), SLA (Lyster & Ranta, 1997; Long, Inagaki & Ortega, 1998; Sakai, 2011) and EFL (Fukuya & Zhang, 2002; Yang, 2010).

The Significance of Corrective Feedback within the Scope of Sociocultural Theory

Sociocultural Theory (SCT), as suggested by Lev Vygotsky (1978), describes learning as a social process. In his theory, Vygotsky mentions the importance of social interaction in the cognitive development of an individual. In order to identify the connection between sociocultural theory and the process of language acquisition, Lantof (2006) identifies two basic constructs of sociocultural theory in terms of language development, which are mediation and internalization and the use of L2 by speakers as a mediator was paid extra attention by researchers working in this field (Frawley & Lantof, 1985; Ellis, 1997, 2003; Swain, 2000, 2001). According to Ellis (2009, p.12) language learning is defined as "dialogically based and that acquisition occurs *in* rather than *as a result of* interaction". In this sense, it is difficult to define L2 learning as a purely individual activity. As development, according to this theory, originates in the Zone of Proximal Development (ZPD), the guidance learners get from more capable peers or the collaboration emerging between a novice and an expert becomes extremely important. Corrective feedback is an important part of this collaboration taking place between learners and the teacher in the classroom.

As teachers constitute an important part of this process of error-feedback-uptake, their characteristics have got significant roles when their reactions, attitudes and personal features are taken into consideration. One of the most widely disputed teacher characteristics is their being native or non-native.

NS-NNS Teacher Dichotomy

With the increasing importance of English as a second/foreign language all around the world, the need for teachers who will teach this language has also increased. A long standing question deals with the instructional differences, if any, between NS and NNS teachers of English. Davies (1996, p.157) points out that "the native speaker is a fine myth: we need it as a model, a goal, almost an inspiration. But it is useless as a measure; it will not help us to define our goals." Likewise, Medgyes (2001, p.440) suggests that "...the glory once attached

to the NS teachers has faded, and an increasing number of ELT experts assert that the “ideal teacher” is no longer a category reserved for NS teachers.” Widdowson (1994, p.385) also mentioned similar things about the issue saying that “the very fact that English is an international language means that no nation can have custody over it.”

Most of the studies carried out up to now were either related to the student opinions of NS and NNS teachers(Samimy & Brutt-Griffler, 1999; Moussu, 2002; Liang, 2002) or related to the differences between them in terms of their evaluations of discreet out-of-context sentences (James, 1977; Sheorey, 1986; McCretton & Rider, 1993;). However, studies focusing on the classroom talks of native and non-native speaker teachers and their reactions to students’ oral language productions are very scarce. It is believed that this chapter will contribute to the related literature with the fact that it was carried out two different ELT settings in two different countries and that its basic focus is on the teachers’ reactions to students’ oral language productions in these two settings.

This work summarized in this chapter aims to answer the following research questions:

- 1. What kind of errors is committed in the reading-based discussions in the Turkish and American ELT settings by learners of English?
- 2. What are the attitudes of NS and NNS teachers of English towards these errors? Are NS teachers of English more tolerant of learners’ errors than NNS teachers of English?
- 3. What kind of corrective feedback do the NS and NNS teachers of English supply to the errors students make in the reading-based classroom discussions?

METHOD

Participants

The subjects for this study discussed in this chapter were 1 native and 1 non-native speaker teachers of English in a Turkish EFL context and 1 native and 1 non-native speaker teacher of English in an American ESL context, all of whom were teaching at the university level to adult learners with intermediate level of English. Demographic information related to the 4 teachers taking part in this study discussed in this chapter is given in the Table1 below:

Table 1. Demographic information about the participant teachers in both settings

Turkish EFL setting		American ESL setting	
NS Teacher of English	NNS Teacher of English	NS Teacher of English	NNS Teacher of English
Female	Female	Male	Female
American	Turkish	Korean	American
M.A.	PhD	M.A	M.A
5 years of experience	10 years of experience	6 years of experience	3 years of experience

Table 2. Demographic information about the participant students in both settings

Turkey		The USA	
NNS Teacher	NS Teacher	NNS Teacher	NS Teacher
20 students from Turkey	18 students from Turkey	2 students from Korea	1 students from Mongolia
1 students from Uzbekistan	1 students from Turkmenistan	3 students from Vietnam	4 students from Korea
1 students from Kazakhstan	2 students from Uzbekistan	4 students from China	1 students from Russia
2 students from Turkmenistan	1 students from Kazakhstan	1 students from Japan	6 students from Japan
		2 students from Samoa	1 students from China
		1 students from Timor-Leste	
		1 students from Germany	

Demographic information about the participant students in both settings are given in Table 2.

Instructional Context

The instructional context this study in this chapter includes two different countries and two different ELT settings. The classrooms in Turkey and the USA were both located at state universities and they both included intermediate level learners of English. In each setting, two different classes were chosen; one taught by a NS teacher of English and one taught by a NNS teacher of English.

Procedure and Interrater Reliability

In the writing of this chapter, reading- based courses were chosen because the researcher thought that the classroom interactions taking place throughout the discussions might lead to a greater amount of learner language when compared to more traditional teacher-centered lecturing sessions in grammar-based courses. Classroom interactions in both settings were audio-recorded for 4 weeks in both of these settings, where students and teachers came together for 4 hours a week. Before the recordings started, the teachers were not informed of the exact focus of these recordings in order not to influence the natural flow of the courses. After the recordings were over, they were transcribed by the researchers in order to carry out a detailed analysis and they were each numbered and described as “episodes” by the researchers. In each episode, types of learner errors, types of teachers’ corrective feedback and whether these types of corrective feedback led to learner uptake (Lyster & Ranta, 1997) were analysed with a view to finding out the similarities and differences between the

classroom interactions taking part in a class taught by a NS teacher of English and the classroom interactions taking part in a class taught by a NNS teacher of English.

Analyzed Categories

In this chapter types of errors and feedback were analyzed according to the categories shown in Table 3 below:

Table 3. Categories of analysis related to error and feedback types

Error	Feedback	Feedback Type
Grammar	Feedback	Explicit correction
Vocabulary	No feedback	Repetition
Pronunciation		Recasts
Other		Metalinguistic feedback
		Clarification request
		Elicitation
		Multiple feedback

In each classroom, 5 episodes of teacher-fronted text based discussion were analyzed and coded by the researcher. 10% of the data was chosen randomly. It was firstly coded by the researcher and then a training manual for the second rater was prepared by the researcher and it included the definition of each type of learner error, teacher feedback as suggested by Lyster and Ranta (1997) and student reactions –whether there was an uptake or not. In this same manual, for each type of learner error, and corrective feedback, one example was supplied. The examples in the training manual were not the same with the original data that the second researcher was asked to code. The rater is a researcher with a PhD in English language teaching who is working in the same department with the researcher. After the codings were compared and contrasted, interrater reliability was found to be .94.

FINDINGS AND DISCUSSION

The first research question this chapter aimed to answer was about the types of errors committed by learners in the EFL settings. The following table indicates the types of errors committed by learners.

As can be seen in the Table 4 above, the majority of the errors committed in both contexts consists of grammar and vocabulary errors. Some example errors are shown in the following excerpt which is one of the transcribed episodes in the American ESL setting, in a class taught by a NS teacher of English.

Table 4. Distribution of errors according to 2 different settings

Error Types	Turkish EFL NS Teacher	Turkish EFL NNS Teacher	American ESL NS Teacher	American ESL NNS Teacher
Grammatical	10	9	9	8
Lexical	7	8	5	3
Pronunciation	8	6	6	2
Other	3	1	2	1
TOTAL	28	24	22	14

Excerpt 1

22	T	OK, here it says “No pain, no gain”. What do you guys think? What are your ideas? What does this mean to you? Guys, listen up. You’ve heard that before?
23	Ch	You don’t have a pain. You don’t have a adventure (grammatical). You are challenging something. (inaudible)
24	T	Yeah, you are challenging. OK, anybody else?
25	Sh	When we young (grammatical), we don’t care about success (grammar), probably we don’t understand. But when we get older, we think we success (lex). We make long way until now like, I can’t explain. Past, we start when we born (grammatical). Now and past, all our way our success. Because we went kindergarden, is very success (lexical).. We learn how to eat, how walk, how to explain our feelings, so everything success (lexical).. When we start to working (grammatical), we always fall down. When we stand up and go next step next step and next step.
26	T	T: OK, good. Anybody else wanna share something? Any experience, any story?

In order to be able to answer the second research question of this chapter, in addition to the types of errors committed by learners in these two settings, frequencies and percentages of error treatment sequences were discerned for each instructional setting. Table 5 illustrates the numbers of errors in both settings and the ones that are ignored by NS and NNS teachers as well as the types of corrective feedback for these errors committed by learners.

Table 5. Frequencies and percentages of error treatment sequences in Turkish EFL context

	NNS		NS	
Number of Errors	28		24	
Number of Errors ignored	2		10	
Feedback Type	Number	%	Number	%
Explicit correction	-	-	-	-
Recast	17	65	7	50
Clarification requests	-	-	-	-
Elicitation	6	23	4	28
Metalinguistic feedback	-	-	-	-
Multiple feedback	-	-	-	-
Repetition	3	12	3	22

Table 6. Frequencies and percentages of error treatment sequences in American ESL context

Number of Errors	NNS		NS	
	14		22	
Number of Errors ignored	3		15	
Feedback Type	Number	%	Number	%
Explicit feedback	1	9	-	-
Recast	5	45	4	57
Clarification requests	-	-	-	-
Elicitation	2	18	1	14
Metalinguistic feedback	-	-	-	-
Multiple feedback	-	-	-	-
Repetition	3	28	2	29

As can be seen in Table 4 above, the NS teacher in the Turkish EFL context was more tolerant of learner errors in general. When she felt the need to supply corrective feedback, she mostly used “*recast*” and “*elicitation*” as forms of feedback. Likewise, the most common feedback types supplied by NNS teacher were “*recast*” and “*elicitation*”.

As it is shown in Table 6 above, in the American context, similar to the one in the Turkish context, the NS teacher was more tolerant of student errors; for this reason, he preferred to ignore most of the student errors. The tolerance of NS of English is quite apparent in Excerpt 1 above. Even though the utterances produced by the learner include a lot of grammatical and lexical errors, he simply ignores them.

This finding of the chapter is parallel to those of Arva & Medgyes (2000), Diaz (2009), Sheorey (1986), Hughes and Lascaratou (1982) which suggest that NNS teachers focus more on form and accuracy than meaning and fluency. As another similarity with the Turkish context, in the American context, too, both the NS and NNS teacher preferred to supply corrective feedback in the form of recast mostly (45% and 57%), and repetitions, respectively (28%, 29%).

When the findings of this chapter are taken into consideration, the finding that in both settings, recast is the most common form of corrective feedback in the foreign language classrooms is parallel with the findings of previous studies (Lyster & Ranta, 1997; Lyster, 1998b; Doughty, 1994). Moreover, the finding in the American ESL setting suggesting that “*repetition*” is the second most common form of corrective feedback is similar to that of Pica et al. (1989).

Chapter 41

UPTAKE AND AUDIO RECORDINGS: EXPLORING LEARNERS' RESPONSES TO CORRECTIVE FEEDBACK

Megan Calvert*

Kocaeli University, Faculty of Education, ELT Department,
Kocaeli, Turkey

ABSTRACT

While numerous studies have been conducted into the effects of corrective feedback (CF), learners are not often asked their opinions on why they incorporate or reject such feedback in their revised work. The classroom-based study discussed in this chapter builds on a previous study in which feedback types and error types were compared to uptake rates on a revised audio recording. Since feedback and error types seemed to show very limited correlation with uptake, further investigations were conducted to explore students' reasons for their responses to CF. Twenty one students were shown the original comments and data about their uptake and then interviewed briefly to examine their attitudes and approaches to the assignment. Results reveal a variety of possible reasons why students may be more or less inclined to make changes to a second recording based on their teacher's CF. An heuristic device to help teachers prevent problems with similar assignments and increase uptake rates is proposed.

INTRODUCTION

A great number of teachers believe that corrective feedback (CF) helps students improve their language ability, and it could easily be argued that we have good evidence for that belief. Numerous studies confirm that corrective feedback is effective at improving accuracy in revisions (Ferris, 1997; Ferris 2001; Sheen, 2007; Truscott and Hsu, 2008) and ultimately in learning gains (Sheen, 2007; Bitchener, 2008). More specifically, certain studies have

* Corresponding Author Email: calvertmegan@gmail.com.

linked modified output or uptake (meaning here an attempt at repair in response to CF) to higher learning gains (Sheen, 2008; Lyster and Ranta, 1997; Nobuyoshi and Ellis, 1993). Although this would indicate that the internal process by which students respond to corrective feedback and use it to make revisions would be a major subject of concern for teachers and researchers, limited research has been conducted to explore participants' perspectives on corrective feedback in real classroom environments. This absence has drawn the attention of researchers in recent years, such as Storch (2010), who calls for more of this type of research in particular in her critical meta-analysis of recent written corrective feedback research:

This call for more qualitative approaches to research on WCF does not imply that there is no merit in experimental research on the topic. Rather, what I argue is that in the desire to conduct more robust research, the pendulum has swung too far towards experimental studies. If the aim is to shed light on the impact of WCF on students' writing, then I would like to propose that future studies need to adopt a more qualitative and ecologically valid research design. (Storch, 2010; p. 44)

This chapter, therefore, seeks to contribute to our knowledge in this realm by examining students' reasons for varying levels of uptake in a real classroom situation by means of qualitative interviews. It additionally fills a rather notable gap in research because it concerns written corrective feedback on student audio recordings, a unique situation which fuses elements of both written and oral classroom communication.

LITERATURE REVIEW

Studies in the past have linked varying levels of effective response to numerous possible factors which could play a role in student uptake. These include misunderstanding of CF, affective factors and attitudes, developmental readiness, and attention and engagement.

Misunderstanding of CF

One of the earliest studies in CF was that of Fanselow (1977), who analyzed 11 different teachers in the classroom, their feedback habits, and student responses. In this chapter, it was speculated that confusion and ambiguity were playing a role in these interactions and leading to continued errors. One issue he pointed to was the fact that students may not have recognized a teacher's response as corrective feedback if it was too subtle: "When a student's incorrect response is followed by a subtle shaking of the head or 'again,' the student does not necessarily know that his response contained an error or know the location of the error. 'Again' can mean 'I did not hear you' as well as 'you made a mistake'." (588). Fanselow also draws attention to the fact that repetition may be used confusingly either for corrective purposes or for reinforcement, and that the inconsistency of response to errors in general may leave students unsure about standards of acceptance.

While not a major concern of researchers in subsequent years, the issue of misunderstanding has not gone unnoticed in more recent studies. Lyster (1998) points out that recasts may have lower rates of uptake simply because they can confuse learners for the same

reasons pointed out by Fanselow—that learners often do not recognize the more subtle corrective force in rephrasing or repeating and may in fact mistake these discourse moves for actions such as confirming understanding, reinforcing correctness, or to create a sense of solidarity with the interlocutor. Conrad and Goldstein (1999) also pointed to misunderstanding of written CF as a reason for unsuccessful revisions in their analysis of 3 students' papers and subsequent qualitative interviews. Egi (2007) additionally points out that the form of recasts can determine whether learners interpret them as responses to content or as CF.

Affective Factors and Attitudes

Several studies that examined the effectiveness of CF have pointed to the role of affective factors and individual differences. Sheen, in two subsequent studies, suggested that aptitude for language analysis may be strongly related to increased acquisition (2007) and demonstrated that low anxiety learners tended to outperform high anxiety learners when given CF in the form of recasts (2008). Dekeyser's (1993) study of Dutch high school students also showed a correlation between low anxiety and benefits of CF. High previous achievement and strong grammatical sensitivity, factors which were also associated with students who had higher rates of uptake in Dekeyser's study, could also be linked to these lower level of anxiety.

Goals and attitudes towards feedback are also considered in several studies. Storch and Wigglesworth (2010), in a quasi-experimental study of advanced level university students showed that students' attitudes and beliefs about good feedback and good writing in some cases led to resistance towards feedback that contradicted these notions and lower rates of uptake and retention. Swain and Lapkin (2002) similarly noted a resistance to feedback in their analysis of the process of revision in response to reformulated writing by one pair of adolescent French immersion learners. This resistance was only noted to occur, however, in two main circumstances: 1) if the reformulation contradicted a rule that had been internalized incorrectly or 2) if the reformulation contradicted their original meaning. On the other hand, when learners do not dispute the feedback, several studies show that a strong motivation towards improvement can have a positive effect on learners' revisions (Dekeyser, 1993; Conrad & Goldstein, 1999; Mackey, 2006).

Another related and interesting factor to consider is the role of the relationship between the teacher and the student. Lee and Schallert (2008) examine two different English learners in a Korean classroom and their attitudes about written feedback in depth. They discover that one key factor that influenced uptake on revisions was the level of trust in the teacher, pointing out that while one student embraced the comments, the other resisted them because of a suspicious attitude towards the teacher's competence. While the fact that the teacher was a non-native English speaker does play a role, the need to consider this relationship is important in any circumstance.

Developmental Readiness

Another individual difference that may play a role in student response to feedback is their developmental readiness and level of proficiency. Ammar and Spada (2006) for example, studied a group of primary school students' acquisition of third person possessive determiners and found that students' proficiency level had an impact on the effectiveness of feedback. They found that while high proficiency learners benefited equally from prompts and recasts, prompts were more effective for lower proficiency learners, indicating that the type of feedback may be less relevant for advanced learners. In an experimental study of adult and young adult learners of English in Australia, Mackey and Philp (1998) also divided learners into "readies" and "unreadies" in terms of their developmental readiness for question formation, and found that the "readies" were in fact better able to benefit from feedback and post-tests.

Attention and Engagement

Lastly, studies have also shown that where students focus their attention and how they engage with feedback may also play a role in the effects of CF. In one interesting study of oral CF by Sheen (2004) that analyzed four widely varied language classrooms in Canada, Korea, and New Zealand, both the salience of the recast and the extent to which students were oriented to linguistic form seemed to have a positive impact on rates of uptake. In other words, it seems that learners not only need to recognize the corrective force of the feedback, but it needs to have strong significance to them as well.

Lyster and Mori (2006) in a comparison of two different foreign language contexts, French and Japanese immersion classes, showed that a teacher's emphasis on accuracy may also play a role in increasing or decreasing rates of uptake in response to oral CF. Storch and Wigglesworth (2010) furthermore emphasize in the results of their study of pairs working to revise a piece of writing that learners who engaged more with the feedback demonstrated both higher rates of uptake and retention in a post-test. Hyland (1998) also examines and compares two learners' revision processes over a semester in depth, showing that each learner was driven by complex influences toward either the communicative force of language or the correctness of it. These studies all seem to imply that the area that matters to learners is where they tend to put their efforts.

BACKGROUND OF THE STUDY

This study reviewed in this chapter builds on a previous classroom-based research study which analyzed student uptake rates in three different freshman advanced oral communication classes at a Turkish university. In the original study, students were asked to do a series of digital audio recording assignments on various topics, followed by one re-recording of an assignment of their choice based on the teacher's corrective feedback. The original recordings and the re-recordings were compared for student uptake rates, where uptake was defined by an attempt, successful or unsuccessful, at repair. Of the 346 total CF moves analyzed, 56%

were classified as showing evidence of uptake. The CF was also coded and categorized by type of feedback (metalinguistic clue, explicit, recast, or clarification request) and by type of error (grammar, word choice, pronunciation, or content and organization).

Of the four CF types, the only type to have higher than average rates of uptake was metalinguistic clues, although when these were sorted by general metalinguistic clues (i.e., “grammar needs work”) from specific metalinguistic clues (i.e., “use past tense here”), specific clues had slightly lower than average uptake rates (52.2%) whereas general feedback, which leaves a broad range for attempts at improvement, showed a much higher rate of uptake (71.2%). Explicit correction and recasts had nearly identical rates of uptake at 53.2% and 54.5% respectively, and clarification requests had the only notably lower rate of uptake at 47.2%. This last finding was speculated to be due in part to the students’ and teacher’s likely inability to pinpoint the source of the communication breakdown.

Interestingly, error type also appeared to have little correlation with uptake rates, with all categories hovering around the average. The only category to have an apparently lower rate of uptake was pronunciation. This was believed to be due to students’ relatively limited training in pronunciation compared to grammar, word choice or content.

The re-recording assignment instructions
Recording #6: A Re-recording: Choose any ONE of your previous recordings and think about what you could have done better. Consider your fluency, your grammar, your pronunciation (stress and intonation especially), your vocabulary (including idioms and expressions), the content, and the way it was organized. There is always room for improvement! Improve it, practice it and re-record it. It may be slightly shorter, but it should still be close to the original time limits.

Figure 1. Re-recording assignment instructions.

Although the initial study yielded rather interesting results, it also raised several questions about the factors that lead to effective and ineffective corrective discourse. Certain surprising elements appeared in the data, such as the following conversation with a student named Ecevit (all names are pseudonyms) that arose in response to the original self-introduction recording. The conversation took place in writing, through comments posted to the file sharing website Soundcloud.com, through which students had been submitting their files.

*Ecevit: [audio]...read detective novels, to draw **caricatures**... T: [written comment] What did you say after detective novels?Ecevit: [written comment]oh no! I said "to draw caricatures", but it souds [sic] as if I pronounced "todraw caricatures". It's surely my fault that "to draw" sounds like a compound noun. Terribly sorry for that. :(Another thing, [commenting on a different corrective feedback move] my apology for the incorrectly-spelled words "outside of class, I mean, in my spare time" that you wrote down the accurate version of. :/*

T: [written comment] Actually it's the wrong word stress on caricature that was the problem http://oald8.oxfordlearnersdictionaries.com/dictionary/caricatures#caricature_1

Ecevit: [written comment] Absolutely right! The accurate phonemic transcription of "caricature" is supposed to be like /'kærɪkətʃʊə(r)/. Nevertheless, I pronounced it within the record like /'kærɪkətʃə(r)/, which is quite a dreadful mistake. ∴ Beyond that, this mispronunciation caused me to put away the stress on an improper syllable, the third one in order, I mean. ∴(Again and again I'm deeply sorry for all those mistakes you mentioned superficially. Next time, I hope I'll come up with a much more satisfactory job in your presence. ∴)

This student clearly showed meaningful interest in the corrective feedback his teacher was making, even commenting on errors that he made which were not evident in the corrective feedback, such as the incorrect vowel sounds in “caricature,” or possibly not even evident in the recording itself (“incorrectly-spelled words”). However, when his second recording was analyzed, his uptake rate was the lowest rate of all the students, with 0% uptake on 6 corrective feedback moves. Only two other students in the entire study demonstrated 0% uptake, and in both cases had received unusually little CF. Even the one general metalinguistic clue given, “Work on fluency mainly,” which would have been statistically more likely to result in uptake, was deemed to have no uptake by both analysts examining the data. He had clearly noticed and worked to understand the feedback, and had yet avoided every single error commented on. Further exploration was needed to understand his and other students' thought processes.

An additional interesting factor emerged which emerged when looking closer at individual study participants was the surprisingly wide distribution of individual uptake percentages that students demonstrated in their second recordings (see Table 1). With percentages of uptake ranging from 0% to 100%, and the group split into three roughly equal groups of “low,” “mixed” and “high” uptake, it became apparent that there was more variation from student to student than by CF or error type.

Table 1. Rate of uptake by student

Uptake Percentage Range	Number of Students in Range		Percentage of Students in Range	Classification
0%	3	11	20.4%	Low
1–24%	8			
25–49%	10	24	44.4%	Mixed
50–74%	14			
75–99%	7	19	35.2%	High
100%	12			

CURRENT STUDY: RESEARCH QUESTION

With this background in mind, an additional study was conducted with the following research question in mind: *What factors could be linked with high, mixed and low uptake rates in a closer examination of the revision process?* The intention of the research is

therefore to try to identify more precisely what external factors, behaviors, or attitudes led to more or less “success” on the second recording when success is measured by student correction of marked mistakes. While this definition of success can clearly be seen as faulty since students may have legitimate reasons to disregard the CF given by the instructor, examining the process from this point of view can still yield useful insights for instructors using similar assignments.

Procedure

In order to examine the reasons behind the varied rates of uptake, qualitative interviews were conducted with 21 randomly selected students in the following semester. All were full-time students in their first year of university in an English Language Teaching program, and all except one were Turkish citizens and native or near-native Turkish speakers. The groups were roughly even, with 5 students in the high uptake category, 8 from the mixed uptake category and 8 from the low uptake category. Interviews were conducted subsequent to final exams, ensuring that concerns about grades would not prevent students from answering questions honestly. Interviews were done in English, with students electing to enter either individually or in pairs, and lasted about 5 to 10 minutes per group. Learners were shown written versions of their original feedback in order to stimulate recall. Questions that were commonly asked included, “Can you tell me how you did the re-recording?” “What did you think the goal of the assignment was?” and “You didn’t fix many of your mistakes in your second recording—can you tell me why?” The conversations were recorded and then selectively transcribed, then analyzed for patterns. Some analysis of revisions not related to interviews is included as well.

RESULTS

High Uptake Learners

Of the high uptake learners, a pattern of self-reliance and dedication to self-improvement seemed to emerge. Three out of the five interestingly mentioned turning to outside sources, either a dictionary or a friend who could help. The teacher’s (“T”) original feedback seems to be used in conjunction with these sources.

T: Ah, so you fixed things that weren't on my feedback list either.

Abdullah: I was careful...for example “approximately, approximately, approximately. I tried again and again. And I look at a dictionary and your comments and I listen their pronunciation.”

T: Did you look at my feedback?

Aysel: Yes, absolutely. Actually at first I choose my special words and I look... them at the dictionary.

Adile: I get to listen my friend and he suggested me some things and then I fixed them.

T: So it wasn't just my feedback. It was your friend helping you?

Adile: Your feedback and his feedback.

A fourth student similarly seemed to emphasize her own role and effort in conjunction with the teacher's feedback.

Bahar: "I saw your comments in Soundcloud..."

T: Did you try to go back and look at the feedback while you were doing it? Did you think that was an important part of doing the re-recording?

Bahar: I feedback myself, and other recordings...I'm careful.

By saying "I feedback myself," she seems to imply that self-reliance and her own ability to discern her errors was a more important key than the instructor's comments.

The fifth student in this group emphasized the value he placed on how he could benefit from the recordings, perhaps indicating a strong intrinsic motivation toward self-improvement.

Serkan: I think our English speaking skill is improved by your recordings and the other homeworks because when I listen my voice on the Soundcloud on the first semester, it's so different from now, and I can make a sentence more easily than the first semester.

This appreciation for the value of the assignment seems to show that he approached the re-recording with a similar mindset to the other high uptake students.

Another theme that emerged amongst this group of students was effort and attention to detail, though these were not comments confined solely to the high uptake group.

Abdullah: I read your all comments and...the place where you comment, I re-record again. And I tried again and again. I re-recorded it 10 times or 20 times.

T: Mmm. You really wanted to fix all those mistakes.

Abdullah: For example, I pronounced it 'partner,' partner or partner, like that. It changed.

Adile: My grammar is always full of mistakes... I listened repeat and repeat...

T: So...was it really important for you to fix the grammar and the pronunciation mistakes in there?

Adile: Was it important? Yes, it is important for me because I want to fix them all. So I have to...be full of non-mistakes.

Interestingly, students in this group were not necessarily the most advanced English speakers amongst their classmates as measured by grades and impressions of instructors, but their dedication appeared to lead them to higher rates of uptake.

Mixed Uptake Learners

Amongst the 8 students with mixed uptake rates (between 25 and 75% uptake), the most common theme that emerged in interviews was that of making effort without achieving the

desired results. More than half of the eight students in fact had something to say along these lines:

Ferhat: While I am doing that assignment I was ill. [That's why] I couldn't get all of them. I tried to fix all of them but maybe I couldn't.

Binnaz: When I came to [that part of the recording], I couldn't do that. For example, while [the recording was going on], I said, "it doesn't about," for example. "It isn't about," I should say. That doesn't mean that I don't know the rules.

Sevkal: Actually I write your feedbacks into colorful papers and put them where I can see them, how can I say. And I just try it, but I just fix half of them.

T: Yeah. So you did try...Well I just noticed you have a hard time with past tense.

Sevkal: Actually in my all recordings there was a problem about past tense. I don't know why...when I try to use past I just forget it and I begin to use present tense.

Belgin: Actually I look what did you write, but I think I didn't [do] a good job. I forget. I try to do better, but I forget.

Aylin: I saw this mistake because you send me e-mail with this feedbacks and I search it again and again.

T: So you did look at the feedback?

Aylin: Yes.

T: So you do have any explanation for why you repeated the same mistakes?

Aylin: Maybe. I can't remember it. I saw one and I can try to fix. But already I have a difficult about the grammar, for example, article, and like that. For example, in first term, you said that, "your speaking and your pronunciation very good but your grammar is not good." I know that I have a difficult[y] about the grammar but I tried to fix it.

The students who made these kinds of comments seemed to express a certain amount of frustration at not being to achieve the goals they had set out for themselves. They were frequently aware of what they wanted to achieve ("it doesn't mean I don't know the rules"), and in some cases reported significant effort and deliberate strategies (such as the "colored" papers" described above), and yet still had not achieved a sense of success.

Interestingly, Aylin, a mixed uptake student and Serkan, a high uptake student, were an openly attached couple who participated in the interviews at the same time. When asked for their views on why Serkan was more successful in repairing the errors marked in the original recording, new explanations emerged:

Serkan: "I didn't do different things about it. I just read your explanation about my mistakes and I tried to fix them.

Aylin: "Maybe I didn't read correctly."

Serkan: And she's more excited, more than me.

T: Nervous?

Serkan: Because when she's record her voice, she's so excited about.

T: Nervous.

Serkan: ...Yeah, nervous.

Aylin begins to doubt her efficacy in understanding the feedback even though she reported having "searched it again and again," while Serkan suggests perhaps there are affective factors at play.

Another theme that emerged in the interviews in this group was that these students tended to report less detail in their approaches to the re-recording. One student, for example, reported paying attention to her errors briefly, but not feeling any particular need to correcting them with care:

Makbule: I looked again and then I found my mistakes, like grammatical mistakes like...I said. But only I looked but I didn't do anything about it. Yeah. Only I listen and my record and I yeah, there is mistakes. Like that.

Several students reported doing the recording spontaneously and without prepared notes, either because of time pressure, because they felt perhaps that it was a desirable quality, or because that it was sufficient to apply some effort to correction in this process.

Ferhat: I was ill, and its due date was about to expire, and I just opened the recorder and start to record.

Aylin: And as far as I can, I record spontaneously. I think that, for example, I push, not push, I open the recording and whatever I think I said and this change my speaking ability.

Makbule: So you noticed the mistakes, but did you try to do the recording in a natural way?

S: I did...but I didn't [just] record, but I repeat and I fix them.

Other students who took a less detailed approach to correcting their errors also reported being attentive to the feedback, but as a general note to keep in mind to improve their speaking ability as a whole.

Binnaz: Yes, for example, the first thing you said last semester was intonation. And after your suggestion, I was more careful intonation, for example, or grammatical [errors].

T: Can you just tell me a little bit about how you did the re-recording? Did you try to use the feedback?

Berkan: Well, I did use the feedback, but I didn't take specific parts of it. Because I know I have a very big flaw in grammar so I just tried to record it in a better way, so that grammatical mistakes are not that apparent. So I don't take your reflection point by point, but I take it as a general...grammatical mistakes was the general direction for me in that reflection.

Although uptake was measured mostly in terms of specifics, these students may have had success in this matter more generally.

A less common theme in this group, but one that is quite notable as well, was the suggestion that the feedback may not have been effective because it may not have been clearly understood by the recipients. On mixed uptake student, when asked to give a reason for why she may not have had as high an uptake rate as her interview partner suggested, "Maybe I didn't read correctly," in reference to the instructor's original feedback. Less directly, it emerged in the course of an interview with another student that he had not understood the use of capitals to indicate stress in the word, "hisTORic."

Can: As to the stressing errors, I couldn't get it because I don't know where to stress.
T: Ok, but does this make sense to you where I tried to put the word stress?
Can: Yes, right now, it does.
T: Ok, but the first time it didn't?
Can: No.

The instructor had incorrectly assumed that capitals would be a clear metalinguistic indicator for word stress. Although misunderstanding of CF appeared in a limited way in the interviews, it should be noted that numerous examples of misunderstanding of CF appeared in the original data, and that students are likely under reporting this aspect of concern due to lack of awareness in many cases. One example of this might be worthy of note is another student who, while she did not participate in the interviews, did reply to her teacher's comment and provided a bit of insight into the source of her misunderstanding:

*S (in original recording): I feel **myself** bad about it...[error in bold]*
T's CF: I feel bad about it
S: I feel bad about it so much but I am staying at dormitory and while I was recording, there were sounds like this and more. I hope you will [forgive] me. And I want to say that I will go my hometown, I am going to prepare a new record and send you. Excuse me please, good days Professor.

This unfortunate misunderstanding of the teacher's recast provides evidence that recasts can easily be misinterpreted as non-linguistic comments; here the student believes the teacher is saying she feels bad about the recording, when she is simply recasting an error.

In this situation, the student's difficulty in identifying this common Turkish L1 transference error was probably also compounded by the lack of both visual access and temporal proximity unique to the context of audio recordings. The lack of ability to highlight the particular error or add emphasis, intonation or gestures as would be possible in either written or oral CF respectively also adds to these types of problems. This second example from a separate participant who was also not interviewed also shows that the lack of ability to highlight an incorrect word merely guided the student to make an additional mistake rather than correcting the one noted:

*S:...in the middle of **the** Turkey...[error in bold; bold not included in original comment]*
T: no "the" is needed
S: in middle of the Turkey

Had the instructor been able to highlight the incorrect word as done here, the student would perhaps have been more easily able to target it and correct himself.

The last point to mention about the mixed uptake students is that students may have had personal agendas that were in conflict with the limited and inherently teacher-centered construct of uptake. One student, for example, explained rather directly why she felt that uptake was not always desirable:

T: Some of your mistakes you fixed and some you didn't. It was 50/50. Do you remember why some of them you didn't fix?

Binnaz: I don't remember, but I may have avoided it.

T: Okay.

Binnaz: Yeah, because if I find it difficult, I may avoid it actually, to be honest.

While it may have been preferable from the teacher's perspective to simply correct the errors as directed, from this student's perspective, correction added difficulty to the assignment, perhaps as a result increasing stress, frustration, or the likelihood of further errors. This comment may also be viewed in terms of stages of grammatical development, and the student may simply have resisted due to lack of developmental readiness. Another student similarly described a conflicting personal agenda:

Can: I just tried to make it more fluent because in my opinion my basic [in]adequacy is fluency because in my speech there are more stops. That's why I try to make it more fluent and no stops.

T: Ok, but I didn't say anything about your fluency, but I did say something about your word stress.

Can: I understand, but I did not consider them much. I just tried to make it better what I don't like in my speech, in my recording.

Whereas the instructor had noted and emphasized word stress as a key to increasing the quality of this student's speaking ability, the student himself had focused on what he felt was a more important area to work on.

Low Uptake Learners

Of the 8 students in the low uptake group (25% uptake or less), certain similarities with the mixed uptake group appeared and unique trends were evidenced as well. It's important to note that one of the key commonalities in this group that was unique compared to the others was that 3 of the 8 students in experienced problems with access to the feedback. One student reluctantly admitted that she had lost the feedback:

Gamze: Actually, I couldn't remember exactly, but I do, I think I do my best in the, in my assignments and I, certainly I had some deficiencies. But I don't know...

T: Well do you remember how you did it? Did you read my feedback beforehand? Did you think the feedback was important? Did you avoid the errors? Do you remember how you did it?

Gamze: Actually I...[asking for translation from partner in Turkish]

T: Lost?

Gamze: Lost. I lost your feedbacks.

T: Ah hah!

Gamze: Yeah, I lost my feedbacks. I only listen again and I try to do it again, honestly.

Another student, meanwhile, reported that the timing of the assignment and her personal circumstances prevented her from having access to the feedback:

T: Do you remember how you did that re-recording? Did you look at my feedback before you did the re-recording?

Nursan: Actually, I was...I recorded this re-recording during a journey. I was going to Istanbul, and I had to record it without seeing your comments.

T: Ah!

Nursan: Then I uploaded the re-recording and then I realized you had sent some comments on it.

A third student seemed not recall having ever seen the feedback:

T: I gave three comments and you didn't use any of the comments in the end. Do you know why?

Kader: No, I don't remember.

T: I just gave you a little bit of feedback on paper. I wrote...[reads comments]. You didn't change any of those. Do you remember seeing this feedback?"

Kader: No.

T: No?

Kader: No I don't.

T: Maybe you didn't see it.

Kader: Yes, I don't remember.

While this third student's response leaves some definite room for doubt, the fact that he did not recall the comments when they were shown to him does seem to indicate that he did not use the feedback to improve his re-recording.

Aside from these unique circumstances which would clearly limit uptake rates, the remaining 5 students shared interesting commonalities as well, the main one being that in most cases they used different words in the second recording. In some cases, this was simply an effect of their approach to the re-recording:

T: Do you remember what you did or how you did it?

Leyla: Actually, I can't remember. But, I think I make, I said some different things from first one. Not same things. So can be about that.

T: So why did you choose to say different things?

Leyla: I don't know because its...I...for example I open my phone and I say "Hi, I am [gives name]," whatever I thought at that moment.

T: So you didn't prepare it, you didn't like, try to write down your mistakes and fix them?

Leyla: No.

Usman: I sit and record with the phone, and I send it to the computer. I'm not listening to it. I just listen to it in the first place with the phone and if it's okay for me then I send it...

T: When you were doing the re-recording, did you look at my feedback?

Usman: No, I'm sorry, I didn't look at, to be honest, I didn't look at it. After I read the feedbacks once, I didn't read the feedback again. I did it on my own."

T: Okay, and why. Or why not?

Usman: I guess because I read the feedback and I didn't go back again. I'm not sure.

T: [...] You just read it once and you thought that was enough? Usman: Yes.

T: Do you remember what you were thinking about the assignment while you were doing it?

Buse: Actually, I read your comments about my first recording and there were some problems about my pronunciation, but I didn't know I have to, I need to record it again. [...] So I don't know if I could correct myself. I think there was some pronunciation problems. I remember that I correct them, like "Portuguese."

T: Yeah, like Portuguese and otherwise like, [...] "it becomes better and better, easier and easier," that was a little bit of grammar. Do you remember trying to fix those in your final recording? Or did you avoid them maybe? Did you avoid them as you were doing it?

Buse: I didn't avoid them [on purpose]. I just correct that word "Portuguese" and I think I didn't use that "easier and easier" again.

T: So you just avoided it [unintentionally].

Buse: Uh-huh.

In other cases, it appeared to be the same strategy, but a bit more intentional.

Orhan: In the re-recording I selected a new topic I think.

T: Ah, ok, maybe it changed.

Orhan: Yes, I didn't use this sentence in my re-recording. That's why I didn't correct it.

T: Do you remember why you decided to use a different story then?

Orhan: Yeah, I...I thought it would be more professional to choose another topic. And you said this sentence is not express your opinion, what you want to explain. That's why I selected another topic to speak about.

The student reported using different words in this case because he felt that it would express his ideas more clearly or that it would improve the quality of his recording as a whole. Had his intentions and his strategy of using entire new sentences and topics been taken into account in the process of determining uptake, the results may have been different. From a research perspective, however, it seems quite difficult in this context to determine accurately the intentions of the student in response to the original feedback.

Finally, Ecevit, the student who had been so interested in the original feedback, but whose classification was 0% uptake, revealed a similar strategy to the other students in this group. In his interview, he explains at first that he took a more natural, spontaneous approach to the recording:

T: How did you approach that assignment? How did you approach that re-recording?

Ecevit: I thought in the first recording, I, uh, I benefit a bit from the notes I had prepared for the recording, but in the second, the improved self-introduction, I tried a bit com...compromise. I just talked about a certain subject, I didn't prepare any notes, any reminders.

He also suggests that there may have been a misunderstanding, this time not of the CF itself, but rather of the goals of the assignment:

T: Were you trying to...I guess my impression is that you were trying to make it better by using different words, make it interesting.

Ecevit: Yeah [...] Is it unusual to do that?

T: Well different students did different things. So some students looked at it and they used the exact same words, but they just fixed their grammar mistakes. But you had a really different approach. You did something totally different, you described different things about yourself, and then...

Ecevit: I may have misunderstood that part.

He also later reveals a barrier to uptake similar to that of S12, the mixed uptake student quoted above, when he demonstrates a personal agenda for self-improvement that's in conflict with the teacher's corrective feedback.

Ecevit: In my opinion, I don't usually make grammar mistakes, grammatical mistakes in my records. But apart from that I just um, work, worked on my vocabulary.

T: So you're really focused on vocabulary?

Ecevit: Yeah, vocabulary. Because I think the only way English I can change the recording, improve the recording, is vocabulary.

These comments contradict the perceptions of the teacher and her feedback on the original recording. Of the 6 CF comments, 2 were classified as grammatical errors, 3 were pronunciation errors, and only 1 was word choice. While the teacher's perception was that grammar and pronunciation were the most meaningful areas for improvement, the student's perception was that vocabulary was “the only way” he could improve.

Table 2. Summary of findings: Themes in interviews by uptake level

High Uptake (N=5)	Mixed Uptake (N=8)	Low Uptake (N=8)
- Consulting with external sources - Use of dictionaries - Assistance from friends - Detailed attention to CF - repetition - point-by-point approach - Appreciation for the value of the assignment	- Perceived frustration in efforts to improve - Nervousness - Less detailed attention to CF - time pressure - spontaneous/natural recording - took “general direction” - Misunderstanding of CF - Intentional avoidance due to difficulty of uptake - Conflicting priorities between teacher and student	- Lack of access to CF - Lost - Physically inaccessible - Never received - Change in content/language choices - spontaneous/natural recording - new content perceived as preferable (“more professional”) - misunderstanding of assignment goals - conflicting priorities between teacher and student

DISCUSSION

While many of the factors examined here have appeared in previous studies as well, others arise that often ignored in less contextualized studies. One theme that arose in the interviews was misunderstanding. Lyster (1998) and Egi (2007) in particular point to recasts as being easily mistaken to have some other non-corrective role. While that problem did appear to arise in other data, it was not mentioned in particular by the students. The only thing mentioned was that the teacher's strategies for indicating stress were not clear to Can, and may not have been clear to other students as well. Indeed, it seems quite difficult for students to pinpoint the source of their misunderstanding or even for teachers and students to readily determine whether or not misunderstanding has even occurred. Beyond the interviews, however, other types of misunderstanding occurred as well, some which perhaps should be considered more deeply for the context of written feedback on audio recordings in particular.

Anxiety, as suggested by Dekeyser (1993) and Sheen (2008), also appeared to a small degree in the interviews with students, although it was only mentioned directly by one student describing another. It is interesting to note that that particular student seemed less inclined to offer that explanation for her own lower rate of uptake. Indirectly, the five mixed uptake students who described an effort to improve their recordings but a frustrated lack of success may have been limited by anxiety and negative feelings derived from lack of success as well.

Attitudes about the CF and level of engagement with it (Storch & Wigglesworth, 2010; Swain & Lapkin, 2002) also play a role here as well. Students in the high uptake group reported a rather thorough engagement with the feedback and a strong appreciation for the value of the assignment, which was in sharp contrast to the low uptake group. Whereas high uptake students embraced and went beyond the CF, low uptake students either rejected, disputed or disregarded the CF they were given. Interestingly, in many cases it was the teacher's perception that these low uptake students who rejected the teacher's feedback tended to have strong English abilities. As Conrad and Goldstein (1999) point out, if a student does not have trust in the instructor, that student may be more likely to reject the feedback. Stronger English abilities and more time spent learning and studying English may have led these students to have more faith in their own self-assessment than in that of a stranger. Motivation, therefore, seem to be strong in students from all three categories, and does not seem to be as strongly correlated with uptake as researchers such as Dekeyser (1993) have suggested in previous studies.

Although also not directly apparent in the interviews, developmental readiness (Ammar & Spada, 2006; Mackey & Philp, 1998) may have also played a role. We might surmise from the evidence that the mixed uptake students who struggled to incorporate feedback despite their strategies and efforts may simply have not been ready to incorporate this feedback. One student who mentioned avoiding errors as a strategies did so because she found it too "difficult" to incorporate them, which may, as previously mentioned, have been a sign of lack of developmental readiness as well. Hyland (1998) mentioned this intentional avoidance strategy in her qualitative study as well.

Given that this study discussed in this chapter is based on a real classroom situation, several practical barriers to uptake appeared in the interview data that are important to consider but not often addressed in research. More experimental studies are less likely to reveal the practical concerns that teachers need to address, in particular lack of access to CF

and misunderstanding of assignment goals. Students who lose their feedback or failed to grasp the task given them may well be excluded from other studies, but here serve the purpose of reminding us of how essential these factors are in successful classwork. Another practical point often overlooked is that underlying various reasons for lower rates of uptake may simply be a lack of time to devote to the assignment. This echoes Conrad and Goldstein's (1999) finding that the pressures of outside commitments can lead to less effective revisions.

CONCLUSION

Given the findings above, an heuristic device (see Figure 2) for teachers who wish to give similar assignments might be proposed detailing four key obstacles to uptake that must be overcome or addressed in order to facilitate maximum benefits from CF. Four questions that teachers can ask themselves to address these obstacles and suggestions for doing so are given below.

1. *Do students have access to feedback?* While students themselves clearly have responsibility for retaining the feedback given them, there are still strategies teachers can use to ensure feedback is readily available when needed. One factor to consider on this point is the means of transmitting feedback. Interestingly, while most of the feedback was given electronically, the one student who reported not seeing his feedback was given his feedback on paper (his recording was submitted on CD), indicating that this difference may have been a factor. Certainly increased consistency in the means of transmission would be advisable, but digital feedback also affords the luxury of a backup copy to help alleviate the problem of loss as well. Since much feedback was going through email and emails can easily be deleted or lost, another suggestion would be to streamline feedback on an audio hosting site such as Soundcloud or a learning management system. This could allow for students to submit assignments and receive feedback which would keep the assignments and feedback more neatly collected in a single tool dedicated to classroom needs. Alternatively, simply alerting students to the need to keep feedback early on in the semester and repeatedly when feedback is given could direct students' attention to the importance of the feedback itself and prevent issues with loss as well.
2. *Do students understand the feedback?* While students also bear some responsibility for understanding the feedback they receive, the onus in this case is arguably more on the instructors. Thus, teachers need to take great care with the feedback they give to increase clarity and limit ambiguity, and numerous lessons can be derived from the data in this circumstance. In the case of the student who did not understand the convention of capitalizing letters to indicate stress, the teacher could have certainly done more to make her shorthand clearer. One option would be, for example, to supply a key to students with typical types of feedback and codes or shorthand to indicate when feedback is corrective and when it is not. Another option would be to supply examples of CF in class and have students discuss appropriate responses to the errors.

3. *Do students understand the assignment goals?* Assignment goals must also be clearly communicated to students particularly to avoid cases where students are creating a whole new recording rather than improving on the original recording. While students' desire for creativity, challenge and self-direction are important and should by no means be ignored, they may not fit into an assignment such as this. If an instructor wishes to have students do a revision recording, much like a revised composition, it could be helpful to convey that expectation very clearly. On the other hand, the interviews here also show evidence that altering the goals and expectations of such an assignment may give students more of a feeling of ownership over their work and thus provide more engagement, which has been shown to be desirable as well (Storch & Wigglesworth, 2010). Pushing them to follow advice that they disagree with or which conflicts with their beliefs about their own skills or about language learning in general may actually cause students to disengage, in which case this would have the opposite of the desired effect. Perhaps a more open negotiation with students about the goals of the assignment would lead to both more engagement and a better understanding of goals.
4. *Do students have sufficient support in achieving those goals?* Finally, providing effective and sufficient support for students in achieving the goals of the assignment may help overcome several obstacles that appeared in the students interviews. In particular, the students who made an effort to correct their mistakes but were not successful in that endeavor could benefit from explicit instruction on strategies for correcting mistakes. The instructor could, for example, walk students through the process and have them practice in class. Class time to work on revisions could additionally prevent problems from outside time commitments or lack of access to resources. If time allows, the instructor can also meet with students individually to explain feedback and guide students toward more effective corrections. Another possibility could be to pair students together so that they support each other through peer reviews and suggestions for improvement. This could simulate the process by which high uptake students improved their re-recordings through input from friends.

Figure 2. Suggested strategies for increasing uptake.

While it is important to keep in mind that uptake may not lead to learning goals as effectively as teachers tend to believe (Truscott & Hsu, 2008), this paper can still shed light on the internal processes of students as they respond to feedback and improve their productive abilities. For teachers who make the assumption that uptake is a worthwhile goal for the classroom, the insights and suggestions given here can serve to improve instruction. In particular, teachers can gain guidance for strategies for more effectively incorporating audio recordings into coursework and for providing corrective feedback on such recordings.

Chapter 42

WRITING AND REVISION WITH CODED AND UNCODED FEEDBACK

Patricia Tehan*

Kocaeli University, Faculty of Education, ELT Department,
Kocaeli, Turkey

ABSTRACT

Corrective feedback has been the focus of debates for the past two decades. Researchers have been dealing with questions of its place in second language writing, its effectiveness, and if it helps (or harms) at all. The results of this previous research have led to the creation of terms for the classification of feedback, such as “direct/indirect,” “focused/ comprehensive,” and “coded/uncoded.” The study discussed in this chapter, which took place in an EFL environment in an English Language Teaching department, investigates the relative effectiveness of coded versus uncoded feedback by comparing two drafts of an assignment. The results indicate that the coded feedback is slightly more effective, but this may be due to discrepancies in the frequency with which each type of feedback was given. While no solid conclusions can be drawn, the chapter implicates that for revision purposes, both coded and uncoded feedback are far more effective for improving accuracy than leaving students to their own devices.

INTRODUCTION

In classrooms, offices and homes all over the world, there are teachers at this very moment giving corrective feedback. They are marking exams, recasting student responses in lessons, and commenting on assignments. While it might not be explicitly laid out in contracts, it is safe to assume that most teachers consider giving corrective feedback an integral part of their jobs: the student makes errors and then learns from those errors, a process fostered by the teacher’s involvement in making the existence of the error known to

* Corresponding Author Email: patricia.tehan@gmail.com.

the student. It is also generally understood that students desire feedback from their instructors as part of their learning process.

The past few decades of educational research have called this process into question, at least in the realm of grammar correction. Though for years many have assumed it to be an implicit part of a teacher's job, the past few decades have seen a strong debate as to its place in the classroom.

Two of the problems with error correction, as noted by Truscott (1999) are the potential inability for a teacher to find (and correctly identify) each type and each instance of an error in a student assignment along with the time involved in circling, underlining, crossing out and changing these errors. In a real classroom setting, even the most conscientious of teachers will find, especially upon seeing the second draft of an assignment, that mistakes in the first draft had gone unrectified.

BACKGROUND LITERATURE

The debate regarding corrective grammar feedback gained momentum in 1996 when Truscott published his call for the abandonment of the practice, calling it unhelpful at best and harmful at worst. Since then, a number of studies on both sides of the issue have been published, attempting to confirm or debunk Truscott's thesis by testing various aspects of corrective feedback.

The majority of the responses (Bruton, 2009; Ferris, 1999; Lee, 1997; Van Beuningen, De Jong & Kuiken, 2012) have been in favor of continuing the practice of giving corrective feedback, though most have agreed that the specifics of the most effective types of feedback and manner(s) in which to deliver it is in need of further research. The argument has also been made that, at the very least, students themselves are in favor of the continuation of written corrective feedback. Citing a number of studies (e.g., Ferris, 1995; Ferris et al., 2000; Hedgcock & Lefkowitz, 1994; Komura, 1999; Leki, 1991; Roberts, 1999), Ferris and Roberts (2001) state that research results "have consistently reported that L2 student writers want, expect, and value teacher feedback on their written errors. In several of these studies, students have also indicated that they prefer indirect feedback with error codes or labels attached over either direct teacher correction or errors being simply marked but not labeled (Ferris et al., 2000; Komura, 1999; Leki, 1991; Rennie, 2000)" (p. 166).

Most of the literature categorizes corrective feedback into two general types, "direct" corrective feedback and "indirect" corrective feedback. Ferris and Roberts (2001) define direct feedback as "when the teacher provides the correct form for the student writer; if the student revises the text, s/he needs only to transcribe the correction into the final version" (p. 163). Bitchener expands on this in his 2008 article, adding "the crossing out of an unnecessary word/phrase/morpheme, the insertion of a missing word/phrase/morpheme, or the provision of the correct form or structure" (p. 105) to the definition. In contrast, indirect feedback, "occurs when the teacher indicates in some way that an error exists but does not provide the correction, thus letting the writer know that there is a problem but leaving it to the student to solve it" (Ferris & Roberts, 2001, p.163-4). This may include the simple underlining, tallying, or coding of errors (Bitchener, 2008; Ferris & Roberts, 2001; Robb, Ross, & Shortreed, 1986).

Other terms in previous literature have also been used to describe and differentiate types of feedback. Lee (1997) uses the terms “overt correction” and “error feedback,” which roughly correspond to direct and indirect error correction, respectively. In a 2005 article, Bitchener, Young and Cameron outline the differences between “coded” and “uncoded” feedback, the former indicating both the place and the type of error (but not the explicit correct form), and the latter indicating the general vicinity in which an error has occurred but not the type or exact nature.

The merits of “focused” and “comprehensive” feedback are also being debated. Focused corrective feedback is when the instructor provides feedback on only a single or a small group of features previously selected as targets, e.g., articles (Bitchener, 2008; Sheen, 2007). Comprehensive feedback, therefore, is when the instructor provides feedback on errors regardless of type. Sheen et al. (2009) noticed greater improvements in the focused feedback group than the comprehensive group (though they noted that the unsystematic nature in which the comprehensive feedback was given may have influenced the results). Van Beuningen et al. (2012) point out that comprehensive feedback is the style that most teachers actually practice in the classroom because the goal is to make overall improvements, rather than improving a few select features.

Another important issue related to written corrective feedback is whether the students are aware of their errors in the first place. Researchers in the field of second language acquisition have referred to this awareness as “noticing,” and it has been claimed that learning cannot occur without noticing (Schmidt, 1990). For example, Lee (1997) created a study testing students’ knowledge in grammar correction, finding that most participants in the study had the requisite understanding to correct errors but lacked the perception to find them in their own work; it is also worth noting that the participants in this study had relatively low metalinguistic knowledge and had difficulty assigning terms to describe error type. For this reason, researchers have speculated that teachers’ feedback draws the students’ attention to these errors, which then allows the students the opportunity to refine their interlanguage (Ellis, 1998). Furthermore, because teachers occupy a position of authority, their feedback may add extra weight to the noticing process. Ferris notes that, “Students are likely to attend to and appreciate feedback on their errors, and this may motivate them both to make corrections and to work harder on improving their writing. The lack of such feedback may lead to anxiety or resentment, which could decrease motivation and lower confidence in their teachers” (2004, p. 51). It is worth noting that SLA research has indicated that direct feedback, in the form of recasting, resulted in the least amount of learner uptake (Lyster & Ranta, 1997).

Various studies have revealed conflicting results as to which form of feedback is most effective, though again, most show positive results for corrective feedback in general. Some researchers hypothesize that indirect corrective feedback can lead to more permanent learning because it pushes the students to actively engage in the correction process (e.g., Ferris, 1995; Lalande, 1982). Ferris’s 2001 study indicates that, with or without codes, students who receive corrective feedback outperform those who do not. Both experimental groups, whose work was given either coded or uncoded indirect feedback, were able to accurately fix a substantially higher number of errors than the control group. Chandler (2003) found that error correction improved accuracy significantly more over time than sheer, uncorrected writing practice did. She also found that although students preferred coded indirect feedback (“Underline and describe”), they performed better with direct feedback (“Correct”) and

uncoded indirect feedback (“Underline”). While this reaffirms Ferris’s interpretation of Truscott that student do not always know what’s best for them (Ferris, 2004), it weakens the argument that error correction is harmful.

Adding to the lack of consensus amongst researchers is the lack of connection between the worlds of research and classroom application. In Bruton’s 2009 review article criticizing Truscott’s stance in the debate about corrective feedback, he also picked apart several recently published studies that provide evidence contradicting Truscott. One of Bruton’s main issues is the nature of the assignments used in the studies. As a proponent of process writing, which he describes as, “Purposeful writing with language errors corrected at an editing stage, followed by rewriting – some pre-writing focus optional” (p. 610), he found the writing assignments used in these studies to “not have clear writing purposes or goals, and there is no reference to the students knowing why they are writing. There is no expected assessment either, and of course no criteria, except implicit correctness” (p. 608). Though this type of assignment may be useful for research purposes, he questions whether the non-communicative nature and lack of “ecological credibility” (p. 611) make them worthwhile.

METHODOLOGY

The study for this chapter took place in a university preparation year academic writing course. The researcher is the instructor of this course, and the participants are students in this course. It is an EFL environment, and the medium of instruction is English. In total, the class consists of 31 students (twenty-seven females and four males) representing five European and Asian countries, none of which are primarily English-speaking nations. 90% of the students in the course had had prior formal English education.

Along with the writing course, the students were also enrolled in intensive grammar, speaking, listening/phonetics, reading, and media classes. All teachers used English as the means of instruction. The students were in class for approximately 24 hours per week, of which four were dedicated to their writing course. Coupled with the prior language instruction that most students had received, participants in this study had had extensive exposure to and practice with metalinguistic terminology in comparison to the sample populations of previous studies (e.g., Lee, 1997).

Furthermore, these students are members of an English language teaching department. Unlike students learning English as a graduation requirement or for work purposes in non-teaching sectors, these particular students, upon graduation, are going to be tasked with teaching the very language they are involved in learning. In their hands will be the duty of educating others in a foreign language. In a few short years they are going to be the error-correctors and the feedback-givers for the next generation. In their courses they are not only receiving language instruction, but they are witnessing and experiencing models of teaching that many of them will go on to use in their own classrooms. For these students, these classes are more than just language classes: they are a kind of vocational training. This population is therefore quite different from the participants in most other error feedback studies to date (e.g., Bitchener, 2008; Lee, 1997; Van Beuningen et al., 2012).

These students have all graduated from high school, passed a national standardized university placement exam, and accepted appointments into the four-year ELT degree

program at this university. However, the department administered its own placement exam before the beginning of the first term, consisting of four skill exams (reading, writing, listening and speaking) and one grammar exam. Based on the overall combined results of this exam, the students were separated into two groups of approximately equal size. The students in the first group, who had a global score of over 60%, were allowed to immediately begin their first-year coursework. The students in the second group, whose grammar scores ranged from 4.5% to 15.5% and whose writing scores ranged from 0% to 14% of their overall exam grades, were placed into the ELT department's preparation class for an additional year of pre-first-year language instruction. It is important to note this because although there was no explicit pre-test for the current study, the students' skill level had already been tested as a part of their being in this course in the first place and found to be in need of additional practice for both form and content reasons.

The sample for the study includes 36 first and second drafts from 18 students. Though all students were required to complete the assignment, a number of the assignments were eliminated from the sample population for several reasons. Some students were found to have plagiarized on either their first or second draft, rendering their assignments inadmissible to this study (because what is the point of studying errors that the students didn't actually make themselves?). Other few students neglected to resubmit their original drafts. For ethical purposes, the use of a control group was not considered, though the researcher acknowledges the empirical problems involved.

The material for the study was collected in the middle of the second term of a two-term course. All the students had been enrolled in the course from the beginning and were familiar with the researcher's instruction and feedback style. In class, they had produced timed writing pieces, worked on collective-learning tasks, and completed several peer-review workshops. Prior to this particular assignment, the students had submitted a number of assignments on various topics. The assignments differed in length (earlier assignments consisting of a single paragraph and later assignments getting progressively longer) as well as in style – some assignments were descriptive or narrative (and did not require much analysis from the students), while others, particularly later assignments, were opinion or persuasive essays and needed more significant explanation and justification. The assignment for this study asked the students to choose an example of a story about a popular local folktale character. They were then to re-tell and analyze their chosen story, looking at the conflict, solution and lesson. This was given as an at-home assignment and due five days later.

The assignments were corrected in the same fashion as all other assignments since the beginning of the course the previous fall. As with the previous assignments, the feedback was unfocused and comprehensive, including issues of content, paragraph structure, grammar, spelling and punctuation. For the purposes of this study, feedback was categorized as either "coded" or "uncoded". These terms are based off of Bitchener's definition (2005), but altered in a few ways. In this chapter, "coded" feedback is a mixture of features of direct and indirect feedback whereas "uncoded" is purely indirect. The main distinction between "coded" and "uncoded" feedback as they are used in this chapter is that "coded" feedback guides the student towards a specific type of correction, whereas "uncoded" feedback requires the student to identify the exact location, type, and correct version of the error. Included in "coded" error corrections are instances where the specific type of error (e.g., word choice, tense, spelling, preposition, conjugation) was explicitly given; instances where an unnecessary word was crossed out (e.g., "they came ~~by~~ running"); and instances where a

specific missing word was indicated (mostly articles and prepositions). “Uncoded” error corrections include instances where the fact that an error had occurred was indicated by circling or underlining the general area in which the error occurred, but the exact nature of the error was not stated (e.g., in the clause, “The problem didn’t solve,” the incorrect usage of passive voice was circled but no explanation was given). The two types of feedback were given randomly to all students; as this is descriptive research, there was no manipulation of the total instances of either type of feedback. Therefore, it happened that “coded” feedback was used significantly more frequently than “uncoded” feedback.

Feedback was not limited to grammatical and lexical errors; comments regarding content and structure were given on each assignment. Most students were requested to re-evaluate or further explain their analyses of the story’s message. However, for the purpose of this current chapter, only the instances of grammatical and lexical feedback are included for measurement.

The students were asked to re-write the assignment, again with a five-day period in which to complete their revisions, and submit both the original along with the second draft. The two drafts were then compared, and the changes were tallied and classified. A variety of revision phenomena were identified and categorized using the following terms. “Successful Uncoded Corrections” refer to instances where the student made the appropriate change to an uncoded error correction (e.g., the alteration of “The problem didn’t solve,” into “The problem couldn’t be solved.”). “Successful Coded Corrections” refer to the student having made the appropriate change to a coded error correction (e.g., the insertion of “at” in the clause, “Look at these brutal people,” in the second draft in response to the code “prep”). “Unsuccessful Uncoded Corrections” are instances where the student either made a change to the original, but not the necessary one (e.g., the student changed “...without pay any money,” in which “pay” was circled, into “...without give any money.”), or where the student ignored the feedback. “Unsuccessful Coded Corrections” refer to the student having either made the correct type of change, but in doing so made a new mistake of the same type (e.g., insertion of the incorrect preposition in response to the code “prep”), or the student ignored the feedback. A “New Error” is an error that only appears in the second draft. In some cases, the student incorrectly wrote something that had been done correctly in the first draft. In other cases, the student added new content to the second draft that contained one or more errors. An “Uncorrected Original Error” is a grammatical or lexical mistake that the instructor neglected to indicate on the first draft and which was then carried over into the second draft. Finally, a “Self-Identified Correction” refers to an instance where the student rectified an error that had not been indicated by the instructor.

RESULTS

Of the eighteen sample first drafts examined, a total of 32 uncoded and 51 coded instructor error corrections were identified. In the revisions, a total of 19 successful uncoded corrections, 37 successful coded corrections, 13 unsuccessful uncoded corrections, 12 unsuccessful coded corrections, 40 new errors, 32 uncorrected original errors, and 4 self-identified corrections were identified.

Table 1. The total number and average frequencies of different types of errors in Draft 1

Draft 1 Errors	Actual Instances	Frequency	%
Coded	51	2.83	44.34
Uncoded	32	1.8	27.83
Uncorrected Original Error	32	1.8	27.83
Total	115	6.39	100

In the second drafts, on average, each student made 3.33 successful corrections out of an original average of 6.39 errors per draft. This is just over half of the total errors per draft including the ones missed by the instructor. The students were able to successfully correct uncoded error feedback 61.1% of the time. They accurately made 72.5% of the coded error feedback corrections.

For the second drafts, students revised both the form and content of their first draft. Most of the second drafts included significant amounts of new material that had not been previously corrected. This resulted in a high occurrence of new errors (40 in total, or an average of 2.2 new errors per draft).

Table 2. The total number and average frequencies of different types of corrections in Draft 2

Draft 2 Corrections	Actual Instances	Frequencies	%
Successful uncoded corrections	19	1.06	31.67
Successful coded corrections	37	2.06	61.67
Self-identified corrections	4	0.22	0.06
Total	60	3.33	100

Table 3. The total number and average frequencies of different types of errors in Draft 2

Draft 2 Errors	Actual Instances	Frequencies	%
Unsuccessful uncoded corrections	13	0.72	13.40
Unsuccessful coded corrections	12	0.67	12.37
Uncorrected original errors	32	1.78	32.99
New errors	40	2.22	41.24
Total	97	5.39	100

In addition to the errors in the new content, many errors from the first draft that had been missed by the instructor were transferred intact to the second draft. Out of 32 errors that were overlooked by the instructor, only 12.5%, or 4 total errors, were changed by the student with no teacher feedback. Of these 4 errors, one was a repetition of an error that was corrected elsewhere in the first draft (unnecessary insertion of the preposition “of”). The other three did not seem to share any stylistic or categorical characteristics.

PEDAGOGICAL IMPLICATIONS

The results of the study discussed in this chapter imply that coded feedback, either by directly making the necessary change or by identifying the nature of the error, leads to a higher rate of successful second draft corrections. They do not imply, however, that uncoded feedback is ineffective. Both types of feedback had over 60% success rates.

Researchers have speculated on the benefits and drawbacks of both types of feedback. Feedback that is more implicit like the uncoded feedback in this chapter may push students forward in their interlanguage development because they make conscientious decisions about each change (e.g., Ferris, 2004; Lyster & Ranta, 1997; Schmidt, 1990); conversely, the delay in confirmation as to whether their changes were accurate may cause uncertainty and thus limit how much they retain from the process (e.g., as reported in Van Beuningen et al, 2012). Regarding feedback that is more explicit like the coded feedback in this chapter, while it guides the student to make the correct change the first time around (e.g., Chandler, 2003), it is much more passive, requiring less mental input and therefore less engaging (e.g., Ferris, 2004). From the side of the instructor, coded feedback also requires more time and effort to accurately identify and name the type of error that is to be corrected.

From a philosophical point of view, I think that in many cases implicit feedback, like the uncoded feedback in this chapter, is best. Particularly, in cases where an instructor is dealing with students who have a history of language education and a familiarity with the rules of the language, uncoded feedback will both challenge the students to use the knowledge they have previously studied while also cutting down on teacher exhaustion. More direct or coded feedback may be best for those students who are just beginning, or who are less familiar with the rules and structures of the language. Second language acquisition research also gives us reason to believe that uncoded feedback leads to more permanent long-term learning (e.g., Ellis, 1998; Lyster & Ranta, 1997). Though this kind of feedback may result in fewer accurate corrections in the short-term, it is reasonable to extrapolate that several repetitions of the noticing process may ultimately result in more permanent student uptake. Although the results for the study discussed in this chapter show a success rate for uncoded feedback that is 12% lower than for the coded feedback, there were also significantly fewer instances of uncoded feedback (38.6% less). This lower frequency of occurrence may account for the slightly lower success rate.

Regardless, the low frequency of students noticing and correcting their own errors indicates that written corrective feedback of any kind is important for the students' learning process. Though one could argue that this shows the ineffectiveness of corrective feedback, as the students were mostly unable to either diagnose their errors on their own by comparing uncorrected work to the teacher's feedback or apply this feedback to their new content, the high response rate to the uncoded feedback shows that some learning is taking place. The major difference seems to be whether the students have attended to the error or not. Considering that revision is a cornerstone of any kind of academic writing, regardless of language background, the effectiveness of corrective feedback in this revision process is clear.

LIMITATIONS AND FURTHER RESEARCH

There are a number of limitations to the study discussed in this chapter. First and foremost is the sample size. A study involving such a small group of participants can only really be used for indicative purposes rather than for drawing clear conclusions.

Secondly are the issues arising from at-home assignments. There is no way to measure the amount of time the students spend on an assignment completed outside of the confines of the classroom. Different students may have spent greater or lesser amounts of time on the assignment and attended more or less closely to the feedback while writing. Beyond this is the issue of plagiarism. Outside of a controlled environment it is impossible to ensure 100% that no copying has taken place. The students in this particular course had received explicit instruction on what constitutes plagiarism as well as the consequences should any instances of plagiarism be discovered. However, even in the second semester, some students were found to have plagiarized on one or more assignments. Though a teacher who is familiar with an individual student's writing may be able to identify plagiarism most of the time, there is still a chance that some will go unnoticed. Students may also have received help from other sources like friends, siblings or private tutors. While this in and of itself is not necessarily problematic, it limits the certainty with which we can ascribe any improvements to corrective feedback alone.

Thirdly, the design of this study discussed in this chapter lacked a control group. Without a control group to compare with, the results cannot be considered conclusive. The ethical implications of using a control group, particularly in a situation where the students' academic futures are directly affected by the course in which the study was done, were the main reason for foregoing the idea. Additionally, as the numbers in this group were already so small, it is doubtful that the inclusion of a control group would have allowed for any more solid conclusions to be drawn. Future studies regarding the use of different kinds of corrective feedback will need to balance the issues of ethics and sample size when including a control group. It may be worthwhile to consider doing studies in a class setting where writing is one component of the course but not the main focus (see Van Beuningen et al, 2012) so as to serve both experimental purposes as well as the students' best interests regarding the giving or withholding of error feedback.

Again with regard to design is the lack of control for the frequency of each type of feedback. In order to more clearly demonstrate a significant difference between the two types of feedback, measures should be taken to ensure that the instances of each type of feedback occur more uniformly throughout the process of future studies¹.

CONCLUSION

Despite the years of language instruction that most of these students had received, their productive skills were relatively intermediate. Many of these students felt they had a full knowledge of English grammar, but most of them were unable to consistently and accurately apply this knowledge to writing of their own production.

The results of the study discussed in this chapter indicate that students are largely unaware of the errors in their own writing. Corrective feedback from the instructor appears to

be, by far, the most effective way of drawing their attention to form-related errors in their writing for revision purposes.

However, the high occurrence of new errors in the second drafts indicates that, despite feedback, students still may not be internalizing and applying the information that the feedback is meant to convey.

While corrective feedback clearly helps students to improve on work they have already done, its long-term effects still appear questionable. The study in this chapter is too small and too limited in time to draw solid conclusions, but it does help add to the current body of research regarding corrective feedback. The chapter is unique in that it not only takes place in an EFL environment, but the subjects of the study are training to become English teachers themselves. The study deals with the realities of a classroom situation. It is small-scale, and the process should both be repeated as well as compared to a larger sample of work over a longer period of time so as to draw more certain conclusions on the effects of corrective feedback on new writing.

Chapter 43

LIVING IN A MULTILINGUAL WORLD: LATEST TRENDS IN LANGUAGE LEARNING VIA A WIDE ARRAY OF EDUCATIONAL TECHNOLOGY TOOLS

Ana Niño*

The University of Manchester, Manchester, UK

ABSTRACT

It has been estimated that some 60% of today's world population is multilingual. Living in a multilingual world makes language learning essential and the foreign language teaching profession even more valued to guarantee communication in a wide spectrum of languages, thus promoting mobility around the world and ensuring the continuity of the translation industry. The emergence of a dizzying array of digital technology tools together with the advent of web-enhanced language learning and CALL are useful to assist during the language learning process, however, the use of technology as a mere replacement of more traditional ways of instruction does not work. The incorporation of the omnipresent Web.2.0 and its mobile, distance, blended and flipped learning opportunities can provide students with a wide variety of authentic resources for the development of both communicative and structural skills inviting them to collaborate and to develop language awareness and learning competences in the process. From the teaching perspective, it is imperative to take some time to reflect on the suitability of educational tools and the implementation of new pedagogies such as constructivism that support the integration of educational technologies in the curriculum without overlooking the importance of maintaining its social and cross-cultural dimension, with a view to encourage autonomy, and increase exposure to the target language and culture.

This chapter presents illustrations of the latest trends and practices in language learning, demonstrating that technology-enhanced language learning enables innovative foreign language delivery and empowers learners to acquire the chosen language in a more independent yet effective way.

Keywords: multilingual, technology-enhanced language learning, CALL, Web 2.0, innovative language teaching, receptive skills, productive skills

1. LIVING IN A MULTILINGUAL WORLD

It has been estimated that some 60% of today's world population is multilingual. Since multilingual speakers outnumber monolingual speakers in the world's population, multilingualism is becoming a social phenomenon governed by the needs of globalization and cultural exchange.

With the Internet facilitating access to information in multiple languages, the need to acquire languages is guaranteed and so is the future of the language teaching profession. There are over 7,000 languages spoken in the world today. Amongst the benefits of multilingualism are increasing cognitive skills such as problem-solving, creativity and memory, appreciating cultural references and nuances that are sometimes lost in translation, and broadening employment opportunities. Employers also value language skills for their potential to open up new markets and the ability to communicate with customers.

Multilingualism and cultural diversity also promote transnational mobility in the form of language exchange programs or employment migration. A multicultural society as a result makes people want to communicate with each other to understand differences in values, which may otherwise cause conflict, and to share perspectives.

In such a multilingual and multicultural diverse world the role of translation and interpreting is key to overcome communication problems and to ensure the maintenance and development of linguistic diversity.

2. PEDAGOGIES THAT UNDERPIN THE INTEGRATION OF THE LATEST EDUCATIONAL TECHNOLOGIES: WEB 2.0, TELL AND CALL

When thinking about the insertion of new technologies applied to language learning and teaching inevitably we think about the benefits of CALL and also about the resistance from many language tutors who still think that technology will eventually replace them.

The various many ways to teach languages with the aid of technology take nowadays names such as CALL (Computer-Assisted Language Learning) or TELL (Technology Enhanced Language Learning). These are not meant to pose a threat to the language profession but rather complement what can be done in class.

The benefits of TELL include providing opportunities for meaningful interaction in which technology-related tasks approximate more and more real-world conditions for conversation and communication (Egbert and Hanson-Smith, 2007; Sanders, 2005). These principles underpin a successful integration of technology into the foreign language curriculum. According to Blake (2013:109), aspects such as theory-driven applications of new technologies, student-centered classrooms and the pursuit of a third place in the quest for bilingualism and the development of intercultural communicative competence should somehow be present in the pedagogical framework in order to design effective materials.

Walker and White (2013) see a move from CALL to TELL. According to them, one of the main differences between CALL and TELL is that they see technology not as assisting language learning but as part of the environment in which language exists and is used. TELL in this sense includes a wider range of devices than “computer” such as mobile phones, game consoles and tablets. This change in the technology means goes in parallel to the various stages of CALL as pointed out by Kern and Warschauer (2000). Their model differentiated between structural CALL, based on a view of language as a formal system of structures and focused on drill and practice methods to achieve accuracy (Castagnaro 2006). The pedagogies behind this first stage approach are grammar-translation and the audio-lingual method. The second phase would be communicative CALL with a dominant communicative language teaching methodology. In the third phase of Warschauer’s model we witness an ‘integrative’ CALL with multimedia and the Internet underpinning our everyday life and teaching. The teaching pedagogy that supports this phase would be content-based with a socio-cognitive view of the language which is developed via social and meaningful authentic interaction leaving behind the formal structural and cognitive systems that dominated the structural and communicative CALL stages.

TELL is more concerned about communication and interaction and supports these three views of language, i.e., structural, cognitive and socio-cognitive. The principal objective then is encouraging autonomous learning, not only accuracy or fluency. The theory behind this view of learning in TELL would be connectivism (Siemens 2005), which is described as ‘a learning theory for the digital age’. Siemens argues that learning occurs through engagement with a diversity of ideas and opinions.

In TELL we can picture the Internet as a vast repository of knowledge and information. In this sense, knowledge exists in the world and can be accessed through participating and collaborating in various group activities. This means a big leap from behaviourism and the belief that a system of repetition and positive feedback could foster correct performance. Constructivism encourages to act upon the environment to acquire and test new knowledge, and social constructivism focuses on learning taking place as a result of the learner’s interactions in a group. In this sense, the role of computers and technology in language learning has changed over time, although some old approaches such as the use of translation or drill practices are still used successfully in TELL applications and mobile devices. The latest trends are linked to CMC (Computer Mediated Communication). CMC goes hand in hand with Web.2.0, a term commonly used to refer to websites that consist of various user contributions in the form of video upload sites such as *YouTube*, social networks such as *Face Book*, photo sharing such as *Flicker*, wikis such as *Wikipedia*, blogs, social bookmarking, online slideshows and presentations, etc. In this respect, Web 2.0 represents a change in the use of the Internet from a medium for merely viewing information to the development of various publishing, social networking and collaboration tools, often media rich, enabling group work and supporting reflective learning. Although CMC may not always be accurate and reliable, the benefits are many. Goodwin-Jones (2011) argues that, as teachers, we should help students to become self-directed learners. This involves providing guidance and useful online tools and demonstrating the benefits and drawbacks of these.

As a result of all these new resources available using Web 2.0, new approaches to teaching have arisen. Some of the latest are ‘flipped classroom’ (Tucker 2012) where students receive videos created by the teacher to explain a particular item which then will be practiced in class leaving more time to engage with communicative activities and/or one-to-one

feedback. In this student-centered line ‘dogme’ learning (Meddings and Thornbury 2009) encourages teaching without course books with students creating content and teachers guiding them in their communicative endeavors to appropriate resources for their learning aims.

These two methodologies are particularly useful in blended and distance learning where students are suggested a list of materials to further investigate or practice a particular learning item. As a result, a more personalized and independent learning arises, which no doubt fosters autonomy and problem solving exposing students to authentic and innovative means for a more enriching learning experience.

Last but not least, in this world of constant emerging technologies teachers may need to keep up to date with these and, at the same time, be able to evaluate the endless list of tools and resources in order to filter them according to their particular needs.

What skills do language teachers need to use technology for language teaching purposes? In this regard Hampel and Stickler (2005) proposed a pyramid model of skills as follows: the first two levels would be a basic ICT knowledge as a foundation, building on specifically technical competences to use a particular software application for teaching purposes. The third level would be understanding the possibilities and the constraints the medium offers and the forth level would ensure the creation of online socialization to develop communicative competence. This model assumes that once an online community has been created appropriate learning materials can be designed for a particular group.

3. EXAMPLES OF THE LATEST TRENDS IN THE USE OF EDUCATIONAL TOOLS AND RESOURCES FOR FOREIGN LANGUAGE TEACHING AND LEARNING

In this section we present ideas in line with the latest trends in the use of new pedagogies and educational technologies for language teaching and learning. We will divide them into receptive skills, i.e., reading and listening comprehension, and productive skills, i.e., speaking and writing. These are just some examples of innovative ways of encouraging autonomous and independent language learning by means of diverse web-enhanced resources.

3.1. Receptive Skills: Listening

Understanding spoken language is a challenging L2 skill. It involves various strategies from predicting, inferring, seeking clarification and concentrating on a particular item of meaning. Walker and White (2013) state that students could learn L2 listening skills better if they had the chance to choose what they listened to, control when and how often they listened, make their own listening tasks, link listening and speaking whenever possible, become active listeners and, most importantly, be able to reflect on their comprehension problems. The Internet is full of various authentic resources for listening practice. *YouTube* features L1 and L2 speakers in video clips which contain a vast variety of excerpts from tv shows, tv ads, films, music, language lessons, etc. Students can select what they want to watch, have control of the replay and pause buttons and can toggle the subtitles on and off to their level/convenience. On the Internet there is also a wide range of radio stations and tv

channels, podcasts on various topics, etc. In a more student-centered approach, students can be asked to design their own video listening tasks around topics of their interest. These may include summarizing, comprehension questions or even combine these with a debate/discussion or with a short summary/composition around the topic after watching the video. They could even create their own listening materials using software such as *Audacity*.

3.2. Receptive Skills: Reading

L2 reading involves skills and strategies such as identifying letters, matching sounds to orthography, dealing with unknown words, using knowledge of the world to predict information, using knowledge about the structure and language of a particular genre, etc. The Internet has created new kinds of reading and writing communities reunited by common interests, e.g., *Online Book Club*, for book lovers. In teaching reading tasks can be digitally designed with hyperlink aids to help comprehension, encouraging the learner to do some pre, during and post tasks to get the most of the reading experience, and linking these tasks with a follow-up speaking or writing task. Culture-related texts are good motivators and work very well at all levels. The key factor here is that students choose what they read: e-books, online newspapers, interactive fiction or Internet adapted reading resources for the lower levels. All of these foster autonomy and social collaboration if for example we link reading with editing a text via a wiki.

3.3. Productive Skills: Speaking

L2 speaking is a complex skill, which involves various linguistic and communicative aspects such as accuracy, grammatical and lexical correctness, fluency and using language appropriately around a particular context and purpose.

The Internet and its vast online virtual community offer a wide range of opportunities for practicing a foreign language by interacting with natives and other L2 learners over *Skype*, for example. There are myriads of language classes, language coaching and language exchanges that are currently taking place this way. In these virtual classrooms synchronous pre-prepared conversations with peers can develop conversational skills further over time. The idea of planning and rehearsing in advance seems to be working for any kind of oral L2 interaction. Oral presentations are a good example. The key is that learning has place in a supportive, non-threatening environment. For pronunciation practice teachers may enjoy using voice recognition programs such as *Vokis*, which convert spoken language into written words and can be an original way of providing students with feedback on a particular task. Students may also enjoy creating an avatar and interacting around the virtual scenarios of *Second Life*.

3.4. Productive Skills: Writing

Writing in an L2 involves skills such as knowing the language rules to express ideas around a particular purpose and audience. Other important factors to consider are accuracy, coherence and genre-related structures. Hyland (2009) identified three approaches for the

teaching of L2 writing, i.e., product-based (which involves students in analyzing model texts in search of language examples), process-based (which involves students in brainstorming ideas, drafting texts and editing in collaboration), and writing as social practice (which involves analyzing genres and giving students a sense of the expectations of readers in a particular context).

An example of software tailored for the product writing approach is *Online Writing Labs* (OWLs), which provide a wide range of resources for writers such as tips on getting started, grammar and proofreading advice, etc. For the process approach the possibilities are endless from word processors, dictionaries and concordancers to mind mapping, digital storytelling, web quests and wikis. All of these lend themselves very well to the practice of L2 writing around the various stages of the writing process, e.g., brainstorming, planning, drafting, composing, editing and revising. At the end of the process would be the tutor providing feedback to students who would revise the text and redraft it accordingly. This can be done via screen recording software capturing the tutor's comments, highlights and notes for improvement on video and forwarding it to students.

The social practice approach makes use of social networking sites such as *FaceBook* or *Twitter*. In this regard students can be asked to follow somebody they admire and get involved in the discussions around a subject of their interest, or even suggest a new topic for discussion, given a particular audience and context. This can be an alternative way of blogging and the fact that the length is limited, they have a real audience, and they need to read and check the discussion thread before replying can benefit the students' language skills in many ways.

The idea of collaborative writing and editing around a subject matter can also be practiced via wikis. These are especially relevant for specialist-language courses where students can be asked to construct a text via problem solving for example a clinical case, or writing an article or report from some real data/statistics. Blogs are also a form of contributing more extensively to an area of study or interest the students feel passionate about. With sites such as *Wordpress.com* is very easy for the students to keep a record of their experiences e.g., during a year abroad and these can be easily shared with other peer students via a virtual learning environment as a means to exchange ideas while they are abroad.

The Internet is rich in resources to help students with good models of the language, in particular with examples of genre-related writing, discussion forums to help with grammar and multiple vocabulary tools, including dictionaries and concordancers.

In this trend, students can make the most of the rich online environment to produce e-portfolios. An e-portfolio is a collection of information that demonstrates development or evidence of learning outcomes, skills or competencies. Producing an e-portfolio usually requires the synthesis of ideas, reflection on achievements, self-awareness and forward planning. This has various educational benefits and serves to practice independent language learning of various linguistic skills (not just traditional composition tasks are allowed, but also video and audio recordings) and cultural references.

However, the Internet may also expose students to bad models of language, e.g., non-native incorrect language texts and/or machine-generated translations. Students often make use of the latter, especially as a result of bad time management when they leave the completion of their coursework for the very last minute. This often results in plagiarism by copying and pasting utterances from the web around a particular topic, or translating some ideas into the target language via free online machine translation systems such as *Google*

Translate. Nowadays there are tools such as *Turnitin* to help spot plagiarism, however, these do not pick up all cases of L2 plagiarism. Language tutors nowadays should be widely aware of these practices and teach the students good time management skills and direct them to appropriate online resources to avoid these malpractices.

CONCLUSIONS AND FUTURE GAZING

Having had a look at the way the wide range of digital and online technologies can enhance the L2 learning and teaching experience we should not forget that these technologies are meant to supplement rather than substitute more traditional activities and tasks. As tutors we should always prioritise the needs of our students, the advantages and constraints of the learning context and the main objectives we pursue.

The future of learning technology looks into various possibilities such as the use of mobile apps, tablets, and game-based learning. In all these, CMC and the use of authentic linguistic and cultural materials are common factors which, together with the fact that students can access them 24/7 at their fingertips, allow for audio and video facilities, visual input, interaction and healthy competition without disregarding the fun factor, which, let's not forget, is an excellent motivator as well.

We hope that through this article we have given an indication of how new technologies may impact on language teaching and learning and the variety of resources and activities that these enable. As technology evolves, language learning keep reshaping but the morale of the story is still the same; as teachers we endeavor to keep up-to-date with the latest pedagogical trends and tools in order to provide our students with innovative foreign language teaching whilst empowering them to acquire the language in a more independent yet effective way.

ABSTRACT

The chapter describes the results of an experiment in building an online platform for learning foreign languages that allows people to teach their native language without being professional instructors. This platform allows audio and video connections between the participants and includes an interface with pre-defined interactive lessons. The content is presented in the form of bilateral scenario cards. Each of the participants (the student and the teacher) follows their own version of the cards in the video chat. For each card presented to the student there is a corresponding card for the teacher containing step-by-step instructions for reading the text out loud or asking the student a question and showing the correct answer. The student can use prompts and translations if s/he does not understand the teacher. The teacher does not have to prepare for the lessons, because the system contains all the necessary teaching materials. This system allows separating the lesson material from the teacher. Thus, the teacher can be any native speaker. The main constituents of content development are: dual language prompts, repetition, comprehension and a dictionary. Four levels are implemented: preschool, beginner, intermediate, and advanced. Four languages are currently supported: English, Spanish, German, and Russian.

In addition to the system description, gamification and viral mechanics are also discussed. Relationships between virality (viral involvement of users) and retention parameters as measurable metrics are calculated and discussed using real examples. Virality and monetization can be both competing and complementary mechanisms for the system growth. The F-growth factor, which combines both virality and retention, is proposed as the metrics of the overall freemium system performance in terms of the user

* Corresponding Author Email: ilya@i2istudy.com; volinsky@usf.edu.

base growth. This approach can be tested using a small number of users to assess the system potential performance. If the F-growth factor is less than one, the product needs further development. If the F-growth factor is greater than one, the system retains existing and attracts new users, thus a large scale market launch can be successful.

1. INTRODUCTION

Students are interested in being able to speak when learning a foreign language. Studying conversational speech is very important for practical purposes, since language training based only on written language and books is not sufficient. As mentioned by Joseph Vendryes, a person who speaks like he writes leaves an artificial or abnormal impression. Foreign language education in the former Soviet Union was based on reading and text translation, and not on speech. Thus, the students were able to read, understand and translate text, but not communicate with live foreigners. There are multiple textbooks focused on the speech aspects of a foreign language (Kohonen et al. 2001).

The research objective of this study was to create a computer application to teach foreigners to understand fluent speech. Each language consists of the two essential parts. One is the written language, and the other is the spoken language. These two types are quite different from the linguistics perspective.

Spoken language skills can be acquired by watching foreign movies or reading novels. Book writers, cultural, political, education and religious leaders provide spoken speech standards. The rest of the society considers their language as a standard. However, casual conversation is the main spoken language characteristic. The term casual conversation is a psychological category. Casual conversation or speech can not be prepared in advance, since it is used in the informal settings. There are certain attributes of the spoken language:

- 1) The number of participants: one, two, more than three, which is correspondingly called monologue, dialogue, polylogue. Dialogue is the main type of the spoken language conversation. It is characterized by changing the roles of the speaker and the listener, when both participants switch their roles periodically. Polylogue involves more than two participants. Polylogue, opposite to a dialogue, is characterized by the theme polyphony, since each of the participants talks about their business, leading the conversation, so to speak. It should be noted that polyphony can be present in a dialogue as well, as two people engaged in a conversation can jump from one subject to another.
- 2) Conditions of the conversation: contact (private conversation), distant (phone conversation, speaking from one room to another, etc.). During direct conversation participants can also use gestures and facial expressions as additional means of communication.
- 3) The main conversation theme as the basis of spoken communication, which is also called constitution. Wherein the spoken language is the participants' reaction to non-

verbal situation components, or is targeted towards available objects, enhancing the speech ellipticity and the role of pronouns.

- 4) Common non-perceptual base is essential for conversational speech construction. Preliminary information, based on the previous everyday experience, is the common non-perceptual base. For example, in the Lev Tolstoy's novel "Anna Karenina", Kitty and Levin, who are in love, perfectly understand each other and only use the first letters of the words in written correspondence.

The main form of conversational speech is oral; however, not every type of speech is conversational. For example, lectures, public performances, scientific talks, TV interviews and reports are not conversational speech. In general, mass media and public oratory use codified language, while conversational speech belongs to the private sphere of communications. This is personal communication mainly with friends and family. Connection between the conversational speech and the household subjects is proven by the fact that violation of this connection is used in the literature to create a comic effect. One type of situation-determined conversational speech is of particular interest: stereotypical and high-frequency repetitive idioms. Learning these question-response cues, or speech patterns, associated with everyday life, it is one of the important tasks of studying conversational speech. There are two types of high-frequency repetitive idioms: etiquette stereotypes and urban stereotypes. "At the store", "On the bus", "In the theater", "At the movies", etc. are examples of the urban stereotypes. The importance of distinguishing stereotypical and non-stereotypical situations is signified by highlighting them in textbooks intended for people studying a second language.

Elemental conversation is even more extensive and interesting area of the spoken language, not related to typical situations. This live speech, which is all around us, can be called free conversational speech, to distinguish it from the urban stereotypes. Its study has increased significantly in recent years.

Conversational speech standards have more variability than the codified language norms in words formation, nominative means, phonetics, etc. Language is regulated by several standards. One is the nationwide standard, which is used by the whole population.

Additionally, there are more particular forms. Thus, unwritten, but multiple mandatory standards play a special role in conversational speech. However, conversational speech is regulated not only by the standards adopted in a particular language community, but also by the etiquette conventions. Certain expressions cannot be used, as they can be perceived as impolite and violating linguistic etiquette. Thus, spoken language skills can be most effectively learned from live verbal interactions with native speakers. This is accompanied by acquiring skills that reflect conversational partner experience, including lexical and cultural verbal communication traditions in stereotypical and non-stereotypical situations.

An online application was developed for practicing spoken language skills with native speakers, which implements described provisions. It is based on the live video and audio connection between real people, where native speaker acts as a teacher. The system contains all the teaching materials in the form of the theme lessons for developing conversational foreign language skills (Benson, 2011). The main requirement for the native speakers is their ability to read, along with education and cultural competence. This can be achieved with a large number of system users.

Table 1. Newly registered users' distribution by the native language

New users by languages									
Month	01.12 - 31.12	01.01 - 31.01	01.02 - 28.02	01.03 - 31.03	01.04 - 30.04	01.05 - 31.05	01.06 - 30.06	01.07 - 31.07	01.08 - 31.08

2. ONLINE FOREIGN LANGUAGES LEARNING AND TEACHING PLATFORM

Experiments were conducted using the users of the i2istudy system that utilized the service at their own will (Osipov et al. 2015a). To conduct the experiments the following advertising was displayed in Facebook social network: “Want to learn foreign languages for free, or teach your native language? Click here.” Almost 40,000 users registered in the system from May through August 2014 as a result of the advertising. Most of the users wanted to learn English, 28,180, another 8,711 users wanted to learn Spanish, 1,028 Russian and 1,791 German. 14,943 users said that their native language is English, 20,673 Russian, 204 German, and 3,843 Spanish. Table 1 shows the newly registered users' distribution by the native language.

The primary research objective was to determine if two people unfamiliar with each other, one acting as a teacher, and the other acting as a student could jointly follow the pre-defined lesson scenario using the step-by-step peer-to-peer system (Benta, Bologna and Dzitic, 2014; Renié and Chanier, 2006; Koa, 2012). All registered users could find other users in the system present online, identified as students or teachers by pressing the corresponding “Learn X language” or “Teach Y language” buttons. This action sent requests to other selected users. Here, the words teacher and student refer to the user roles in the system. Each user can assume both roles as a teacher of the native language and as a student learning a foreign language. The users select the corresponding languages during the registration process, which can be changed later.

The recipient of the teaching or learning request sees the user sending this request, along with the language and selected lesson level. The recipient can either accept or reject the request. If the request is accepted, the interface window opens, where the teacher and the student see and hear each other, and use synchronized teaching materials. During the lesson the users not only see and hear each other, but jointly work with teaching materials divided into small portion (cards). Besides, the student can see prompts and translation in their understandable language. The teacher sees additional instructions, for example to ask the student to repeat words, etc. The lessons are following pre-defined scenarios using face-to-

face communication, realized using the web real-time communication (WebRTC) technology (Osipov, 2014; Osipov et al. 2015a, b, and c). If the “teacher” accepts the “student” invitation and vice versa, a live audio-video session is established. Both users can hear and see each other, along with the synchronized lesson materials. These materials include corresponding individual prompts for the participants in their chosen language. The system also tracks the lesson time for the billing purposes in terms of the game currency or real money (Marks 2012; Válek and Jašíková 2013). At the end of the lesson each participant rates the other party’s corresponding quality of teaching or learning.

As a result of the test, it was established that two unknown people, who met in the developed online interactive system for the first time, could carry on a conversation in a foreign language and effectively help each other. Moreover, part of the users did not speak a common language, and communicated by using system prompts displayed in their respective native language. The average successful connection time was about 12 minutes (189,207 minutes or 3153 man-hours) divided by the 15,842 total successful connections. Any type of connection termination was accounted for, including finishing the lesson, participants terminating the connection within the system, or by simply closing the browser.

Regardless of the fact that the average connection time was not very long, this experiment showed that two unprepared participants, previously unknown to each other, could carry on a conversation for an extended period of time using the developed system. If the lessons duration was not too long, the users could finish them. Moreover, the average connection time continued to increase with the number of active users, reaching over 14 minutes by the end of the experiment in August 2014.

After registration the users were asked to select the role of student or the role of teacher and select a potential partner to start a dialogue, based on the step-by-step instructions. In the system, each phrase is displayed for the student and for the teacher with additional comments. The teacher and the student can see and hear each other in real time. They also see synchronized teaching materials. In addition, there is a chat window, which allows both parties to type instant messages to each other (Kötter, 2001; Kim, 2014; Farr and Riordan, 2014). About 20% of the registered users fully participated in the project (Table 2). The rest were intimidated by the other party, or rejected invitations of the other users to conduct the lessons. Moreover, some of the registered users could not properly configure the hardware (the camera and the microphone) for the live video and audio feed.

Table 2. Newly registered users’ involvement in the learning/teaching process

Month	Involvement								
	01.12 - 31.12	01.01 - 31.01	01.02 - 28.02	01.03 - 31.03	01.04 - 30.04	01.05 - 31.05	01.06 - 30.06	01.07 - 31.07	01.08 - 31.08
Number of just registered users who made a call in period	93	734	61	15	251	1026	2037	2072	722
Percent of just reg. users who made a call in period	7	16	22	12	22	26	25	18	15

Table 3. The most popular lessons for August 2014

Students count	Sessions count	Lesson title	Level
555	1881	i2istudy: Teach your native language!	2
407	1328	Nice to meet you!	2
299	1243	i2istudy: Find Friends All over the World	3
244	904	Hello!	1
208	670	If you get a job	3
195	358	The best day of the year	2
194	502	What time is it?	2
158	485	My family	1
136	402	Describing your city	3
103	185	At the airport	2
88	223	Steak: How to Cook it Yourself	3
88	341	i2istudy: Find Friends All over the World	4
79	205	At the airport	1
63	182	Have you ever...	4
60	86	At a party	2
59	113	Michael Jackson	3
46	114	On the airplane	1
35	69	Clothing store	1
35	72	Computers	2
31	52	At the Supermarket	2

The system currently includes four levels: (1) Preschool; (2) Beginner; (3) Intermediate and (4) Advanced. Each user was given an option to select the foreign language level and the specific lesson theme. The most popular lessons for August 2014 are listed in Table 3. Thus, it is clear that the most popular level was the Beginner (8 lessons), followed by the Preschool (5 lessons), Intermediate (5 lessons), and Advanced (2 lessons).

2.1. Learning and Teaching Principles

The main learning and teaching principles of the i2istudy system are:

- 1) Adults can learn like children (Estes, 2014). This means that the language learning materials were created as a game. Adults, similar to children, can learn faster when information is logically presented in small portions, with increasing level of complexity, and most importantly, with pictures or video (Korkmaz, 2013; Codreanu and Celik, 2013). The aim is to attract people to spend 30-40 minutes at a time playing a computer game using i2istudy. At the same time they are reaching their ultimate goal of learning a foreign language.
- 2) No homework. Predefined learning materials are designed for the student to learn during the lesson, without homework, based on multiple repetitions (Erena and

Henderson, 2011). The system allows better memorizing of new words, including their pronunciation. The student reads and hears the new word from the live native speaker, learning its possible uses. The student can ask the teacher any question during the lesson to better memorize the word and its use in oral speech (Gurkan and Yuksel, 2012).

- 3) No emphasis on grammar. The main task is to learn the spoken language. The lesson is structured to allow the student to learn grammar while communicating with the teacher, like children learn their native language (Estes, 2014).
- 4) All types of cognition. Three types of cognition are engaged: visual memory (pictures and video), auditory memory (direct live communication with the teacher) and motor memory (written tasks using the keyboard to type words in the chat). Typically, individuals are stronger in one type of cognition. Utilizing all types of cognition allows for learning the material more rapidly (Rinaldi, 2014).

To facilitate this process 1) a special *methodological system* was designed, including 2) a *unique interface*, which allows users to understand each other without speaking a common language. The system was developed based on 3) *initial testing* using common people as students and teachers, along with professional foreign language teachers. Based on the numerous tests, 4) *four levels of language learning* were identified, which the user is capable to determine individually without additional testing. Each of these four elements of the process is described further in detail.

2.2. Methodological System Description

Despite the wide variety of different online learning systems, none of them combine live audio and video communication with unique teaching materials. The i2study platform was designed to facilitate the teaching process by native speakers who are not experts in teaching. In other words, while people can speak their native language, they don't know how to teach other people.

Professional foreign language tutors developed two-way cards for the student and the teacher. While communicating using video and audio live feed (Caws, 2013), the student and the teacher follow their own version of the cards. Online interaction between the teacher and the student is facilitated by the interactive materials and prompts, presented in the language that the person understands (Monteiroa, Carrillo and Aguaded, 2010). Cards follow a certain sequence, based on the lesson topic. Imagine a live dialogue between the teacher and the student. What would the teacher ask, and what would be the student's response? The lesson is logically structured this way. It also contains a pre-defined set of instructions for the teacher (Monteiroa, Carrillo and Aguaded, 2010). The teacher should follow these instructions, but not strictly, making the lesson more interesting for the student. However, the lesson should follow the main theme. There is no homework in the system, so the student learns the material during the course of a lesson. This positive learning experience makes them want to come back and learn more (Tal and Yelenevskaya, 2012).

2.2.1. Sequence of Cards

Teaching materials are presented as a sequence of information cards with text and pictures or video. The sequence of cards reflects the whole educational process:

1. Introduction and getting to know each other
2. Introductory questions
3. New material
4. Repetition
5. Oral and written tasks
6. Games, dialogues and quizzes
7. Summarizing the lesson and saying good bye to the student

After the lesson the student takes a multiple choice test based on the newly learned material without the teacher. An example where the teacher speaks English, and the student speaks Spanish is found in Figure 1 that shows an English lesson called “The New 7 Wonders of the World” at the intermediate level, the reading task, card 14 out of 30. Cards represent a logical sequence of the whole lesson, dividing it into small steps, i.e., word, sentence and small text. Based on this step-by-step process, a non-professional teacher is able to conduct a lesson by reading the instructions written on each card in the black font (Figure 1(a)).

2.2.2. Card Description

Each lesson consists of 25-30 cards and lasts about 20-30 minutes. Cards are logically connected, reflecting the theme of the lesson. Each card presents 1-5 sentences, accompanied by an image or video related to the text for its visualization. Both the teacher and the student see the lesson for the first time. The teacher is expected to grasp the card in a matter of seconds and read the task out loud. This is why the text should be short, accurately reflecting the task. In a sense, this is a task for both the teacher and the student, since both see the same card; however, they see their own version (Figure 1).

2.3. Interface Description

2.3.1. Synchronized Teaching Materials

The i2istudy technological platform is based on the two ways of presenting information:

1. Live audio and video connection between the teacher and the student;
2. Synchronized teaching materials displayed to the teacher and the student.

The learning process consists of establishing audio and video connection between the teacher and the student (the process of finding the teacher and the student is outside the scope of this chapter). The teacher and the student are presented with the same card, but it contains customized information. The teacher sees the materials as an aid to the teaching process. The student sees the materials needed for the learning process. The teacher conducts the lesson by switching the cards (grey arrows on the card in Figure 1(a)), which are also switched on the student’s screen (Figure 1(b)).

Figure 1. English lesson called "The New 7 Wonders of the World": (a) Teacher interface in native English; (b) Student interface in native Spanish.

2.3.2. Interface Hints for the Student

The teacher communicates with the student based on the predefined teaching materials, adding his or her own comments as necessary (Yousefi, 2014). These predefined teaching materials allow the teacher to stay on the topic of discussion. If the student doesn't understand the teacher, the hints can be turned on by pressing the "Show task" button (Figure 2 (a)), which displays the phrase pronounced by the teacher in the foreign language to the student. If the student still does not understand, the teacher can display the translation of the phrase by pressing the "Translate task" button (Figure 2 (b)).

Figure 2. Writing practice card displayed for: (a) the teacher and (b) the student.

2.4. Initial System Testing

2.4.1. Template Phrases Creation

All template phrases for the student and the teacher, like description of a game, manners, hints, the need to encourage the student, and so on, have been tested many times to make sure that both the teacher and the student understand exactly what to do (Laborda, 2009). Tests showed that if a person sees a card for the first time, he or she is capable of reading one or two short sentences. Let's consider the template example shown in Figure 3(a).

APPLE

Please repeat it 3 times!

APPLE...

Now write it in the chat.

This template is the result of numerous tests that demonstrate that it works. After reading the template, the teacher understands that s/he is supposed to teach the word "apple" to the

student, which the student is supposed to repeat three times and then write it in the chat window. The initial version was: “Apple - please repeat it 3 times and write it in the chat”. While it looks shorter, the teacher simply read this text, but the student did not repeat the word and did not write anything in the chat. As a result, the percentage of the material learned by the student was quite low. Writing the word to be learned using caps, adding the second word “APPLE...” followed by the ellipsis produced the desired result of the teacher learning the word with the student. Tests showed that the student strictly follows the teacher’s instructions. Even if the task is displayed in front of the student, s/he will conduct the task only when asked by the teacher. Although the task of repeating the word three times is written in the student’s native language (Figure 3(b)), the student repeated the word only one time. After changing the text for the teacher, the student started to repeat the word three times and write it in the chat.

It took about 20 test lessons to tweak all template phrases and captions. These tests were conducted with people who saw the i2istudy system for the first time. Both the student and the teacher were sitting in separate rooms, watched by the developers. Only after the tasks were understood by both the teacher and the student, this testing was finished. The tests involved professional foreign language teachers and students from the Linguistics University of Nizhny Novgorod, Russia.

Figure 3. Words learning card displayed for: (a) the teacher and (b) the student.

2.4.2. Lesson Duration

There has to be a clear distinction between the on-line and off-line lessons. Tests showed that it is hard for both the teacher and the student to study for more than 30 minutes at a time. The ideal online lesson duration is 15-20 minutes. Initial lessons contained 100 cards and 20 new words to be learned. The lesson lasted for 1.5-2 hours, depending on the past of the teacher and the student proficiency in the foreign language. As a result, both participants got tired, losing the desire to repeat this experience. The lessons were then shortened to 45 cards, however, further tests showed that even 45 minutes is too long for on-line live human

interaction. This is why 20-30 cards are optimal. If the teacher is following the cards, without adding any comments and tasks, at the beginner's level the lesson takes 20 minutes (since the tasks are simple), and 30 minutes at the advanced level.

2.5. Four Levels of Language Learning

Based on the predefined materials, it is possible to teach foreign language from the zero preschool level. Students can continue at the beginner's level, improve to the intermediate level, and then progress to the advanced level. The user determines the level individually by reading the level descriptions:

Preschool - I have never learnt this language, can't read, don't know a word

Beginner - I can read, know the basic words and expressions

Intermediate - I have a reasonable vocabulary and understand written text, but I am not very good at understanding oral speech

Advanced - I have a large vocabulary and experience in communicating with native speakers, but lack speech practice

Multiple tests showed that people can determine their level of foreign language proficiency without additional testing.

2.6. Examples of the Tasks at Different Levels

As mentioned earlier, the lessons were created by imagining the live dialogue with the student. Based on this idea, the sequence of cards was designed, reflecting the whole educational process, using all the steps outlined in the **Sequence of cards** section. Following the lesson flow, specific examples of the tasks are given that get more complex, depending on the level. The preschool level is different than the other three, and is not described here.

Introduction (1 card) is the same for all levels, where the participants introduce themselves and get to know each other. Initial testing showed that the teacher tried to continue the lessons themselves by coming up with their own questions, not having a clue what to do next, until the following sentence was added: "After the answer click the slide" (Figure 4(a)). Before this change, the student continued to see the same card (Figure 4(b)). A simple comment provided for the teacher solved this problem. The teachers were quite surprised to see that all the teaching aids have already been created for the whole lesson.

Memory game (2 cards). The student is supposed to remember the learned words based on the pictures shown. The teacher shows five pictures, corresponding to the learned words (Apple in Figure 3, for example) in sequence without displaying the words. It is desirable to choose words that are easy to remember when looking at the corresponding picture. The objective is to repeat the newly learned vocabulary. Memory game from the beginner level lesson "Happy Birthday" is shown in Figure 5 as an example. The teacher sees the correct answers, shown in Figure 5(a), so that the teacher does not have to remember them. The student only sees the picture shown by the teacher in Figure 5(b) with understandable instructions in the native language.

Figure 4. Hello card displayed for: (a) the teacher and (b) the student.

Figure 5. Memory game displayed for: (a) the teacher and (b) the student.

Word Search game for the beginner level (1 card). The student is supposed to find the learned words hidden in the sequence of letters. The main objective at the beginner level is to learn and repeat the new words. The main task at the intermediate level is to learn the new words and repeat the old ones. For example, in the lesson “Making pancakes” the teacher’s card contains the following text:

1. wEGGwo
2. fGLASSt
3. froBOWL
4. CRACKeq
5. FRYiekk

Student's card:

1. WEGGWO
2. FGLASST
3. FROBOWL
4. CRACKEQ
5. FRYIEKK

In one word game for the intermediate level (1-2 cards). The task is to describe three pictures using only one word. The answer should be from the practiced vocabulary. For example, Figure 6 shows the lesson “My free time” at the intermediate level, where outdoor activities, picnic and calendar are described with one word, “weekend”.

Figure 6. In one word game displayed for: (a) the teacher and (b) the student.

Memorize the picture game for the advanced level (2 cards). At the advanced level the tasks should be interesting, since the student already understands the teacher and can ask questions if they don't understand something. The objective here is more complex than just learning the new words. This game develops attention, and is also entertaining for the people who are already fluent in a foreign language. The task is to remember all the picture details and then read the description without seeing the picture, and detect any discrepancies in the

description. For example, the lesson “Our environment” shows the picture and the description in Figure 7. As already noted, people fluent in a foreign language can easily speak the language, but are struggling to repeat the text from memory or can not hold their attention for too long, since other mental processes are involved (Ilgaz, Altunb and Aşkarc, 2014). It is important to use simple words for the distorted description, like describing color, size and specific objects, so that the answer would immediately come to mind.

Figure 7. Memorize the picture game displayed for: (a), (c) the teacher and (b), (d) the student.

The quiz (1-2 cards). The quiz contains intelligent questions, based on the lesson theme. The student should always have three options for the answer, so that the student does not get intimidated by not knowing the answer. Typically, a person is capable of selecting the correct answer out of three options. The question can be quite complex and interesting, but the actual language implementation depends on the level (Wang, 2008). Example of the level-based questions and answers are given in Table 4.

Table 4. Level-based questions and answers

Beginner level	Intermediate level	Advanced level
Who discovered America: • Vasco da Gama, • Marco Polo, • Christopher Columbus? Answer: Christopher Columbus	Michael Jackson was really fond of this cartoon series. He even wrote two singles for it. What is it? • The Simpsons • Futurama • The Flintstones Answer: The Simpsons	Benjamin Franklin became a vegetarian in order to spend the extra money he saved... • on books, • on milk, • in his old age? Answer: on books

Pictures in the quiz should reflect the question rather than the answer. For example, the question about Benjamin Franklin should show his picture, and not the picture of the books (Table 4). This exercise should encourage the student to think, and the picture should not provide an obvious clue.

Summary and good bye (1 card). The last card is the same at all levels. The teacher is finishing the lesson and informing the students to take the test at the end of the lesson on their own (Figure 8). After the lesson the student takes a multiple choice test consisting of 9 questions without the teacher to repeat what was learned and to assess how the material was learned. The student gets a grade. Passing the test is an important psychological step, since the student realizes what s/he actually learned (Laborda, 2009). A sample test at the beginner level is shown in Table 5.

Figure 8. Last summary card displayed for: (a) the teacher and (b) the student.

**Table 5. Example of the multiple choice student test at the end of the lesson
“At the supermarket”, beginner level**

1	What is the title of our lesson today? At the supermarket At the cash-desk Buying food Answer: 1
2	Choose the correct answer! BASKET. It is: 1) Precio 2) Pan 3) Cesta Answer: 3
3	Choose the correct answer! MINERAL WATER. It is: 1) Agua mineral 2) Jugo 3) Leche Answer: 1
4	Choose the correct answer! TO PAY. It is: 1) Pagar 2) Comprar 3) Agarrar Answer: 1
5	Choose things that you can buy at the supermarket: 1) cheese 2) meat 3) dog 4) juice 5) table 6) basket 7) apple 8) computer 9) fish Answers: 1, 2, 4, 7, 9
6	What is wrong? PORK. This is: 1) meat 2) beef 3) food Answer: 2
7	Complete this sentence: At a cash desk you can pay by cash or _____. 1) money 2) by credit cart 3) not pay Answer: 2
8	Complete this sentence: _____ is made of milk. 1) fruit 2) bread 3) cheese Answer: 3
9	Complete this sentence: Fish has more calories than _____. 1) oranges 2) pork 3) beef Answer: 1
10	Test result is displayed.

These are examples of the specific tasks, while the system contains many more tasks and examples. However, the lesson specific steps have been clearly outlined using the discussed examples: introduction and getting to know each other; introductory questions; new material repetition; oral and written tasks; games, dialogues and quizzes; summarizing the lesson and saying good bye to the student. All lesson materials have been specifically designed for the i2istudy project and are unique.

2.7. Research Results

As a result of the conducted experiments, two strangers that met in the i2istudy system for the first time can have a dialogue in a foreign language, effectively helping each other learn. Now imagine that you are meeting this person for the first time. What would you talk about? The main achievement of the i2istudy system is allowing two strangers to carry on a conversation for over 15 minutes in a foreign language. Most users had no problems talking to a stranger online (Kim, 2003). This conclusion is based on the average lesson duration registered by the system. The end of the lesson is based on all different registered scenarios, from completing the task to closing the browser. Table 6 lists successful connections in minutes for each month.

Table 6. Successful connections, based on the duration and quantity for each month

Real connects									
Month	01.12 - 31.12	01.01 - 31.01	01.02 - 28.02	01.03 - 31.03	01.04 - 30.04	01.05 - 31.05	01.06 - 30.06	01.07 - 31.07	01.08 - 31.08
Successful connects duration, min	151	10835	5021	3645	6202	37037	47140	54974	38202
Number of successful connects	19	1228	492	131	587	3093	3868	3763	2661

The average lesson duration was 11.94 minutes (189,207 minutes, or 3153 student-hours divided by the 15,842 number of successful connections). At a first glance, this is not an outstanding result. However, it shows that with the help of the i2istudy system two strangers can carry on a conversation in a foreign language for 12 minutes. Besides, the average lesson duration increased to 14.35 minutes in August 2014. Also, very active loyal users, who spent many hours teaching the same lessons, appeared. Table 7 lists the most active users, based on their teaching duration for August 2014.

2.8. Conclusions for System Description

In the i2istudy system the teaching methodology is independent of the individual's knowledge. Thus, any person without professional teaching skills can be a teacher in the

i2istudy system. The only requirement is the ability to read and communicate in the native language. Based on the hints, even a student at the preschool level can communicate with a native speaker. The system interface allows adding any number of languages by simply translating the existing lessons. There is no need to recreate new lessons. The system currently supports English, Russian, German and Spanish languages. All the user needs to do is select the native language and the language to be learned, and learn from native speakers.

Recalling the study mentioned in the beginning, the following foreign language resources are currently available online:

1. Interactive language resources for self learning
2. Digital textbooks
3. Individual lessons using Skype
4. Mobile educational applications
5. Mobile value-added services

All these models have both advantages and serious drawbacks, such as lack of the live interaction and the guarantee of the quality of teaching materials. The described platform allows combining high quality lessons, since these lessons have been custom developed specifically for the platform by the professional teachers and live human interaction with the

native speaker. The system also facilitates individual tutoring, the most expensive service in the World, without involving real exchange of money, based on the language training barter between the teacher and the student.

It is clear that the system sparks an interest in a large number of the users, allowing them to carry on a conversation in a foreign language. This experience enhances communication and spoken foreign language skills. The authors concluded that the system should be developed further to better facilitate spoken language learning, based on retention and viral user attraction.

3. RETENTION AND VIRAL USER ATTRACTION

3.1. The K-factor

Figure 9 shows the Wikipedia write-up about the K-Factor in marketing. Certainly, in theory the information provided by Wikipedia is correct in Figure 9. However, this is just an eye-brow theory. In real life, this K-factor should be calculated during the entire lifetime of a project, from the launch until the closure. This formula corresponds to the “global” K-factor, which nobody really needs, aside from the security service of a venture capital trying to find out why this or that startup has gone dead.

In real life, what we are interested in is the “local” K-factor (the term is borrowed from “Freemium Economics” by Eric B. Seufert, 2013), i.e., the value calculated during a certain period of time. For example, within our approach, we use weekly factors, i.e., the “weekly K-factor”. Moreover, in our case the statement that the project grows or collapses exponentially, if the value of the K-factor exceeds or falls short of unity, respectively, is wrong!

Figure 9. “Wikipedia” write-up about the K-Factor in marketing.

However, Richard Fond, the author of the Bliss Drive blog, and the Wikipedia entry, and even Harry Harrison in his story called “The K-factor” fail to allow for many factors. Borrowing the term blindly from nucleonics and epidemiology, they assume that merely “infecting” a newcomer is sufficient to expand the user database. In reality, how a project retains existing users is more important than how fast it grows. Also, the ways, which are used to retain users, should enter the formula.

K-factors of actual projects rarely exceed unity, for long periods of time, anyway. A normal current value of the K-factor for a successful and growing project at any given time is equal to 10%, 20%, or 30%, and the project is thriving at that, despite the fact that it should collapse, according to the classical formula. But why? Because it is not a nuclear explosion or a plague in a population of mice, where the death rate of the infected animals is 100%. The thing is that in the normal project, the “infected” users continue using the project and even attract new customers in the following time period.

This can be regarded as a different factor, namely, K-retention, being the ratio of the number of the users, who use the service repeatedly during the current period, as compared with the previous period. This parameter will always be less than unity, since some users will be lost anyway. Even in such environments as a prison or North Korea, this factor fails to reach unity due to release of inmates, mortality, and escapes.

The real, “fundamental” coefficient, which shows the natural dynamics of the project, is the sum of the above-specified factors, specifically, K-factor and K-retention. If the total exceeds 1, the project grows, if it is less, the number of loyal users decreases.

Additionally, we call for using only “active” users when calculating these factors, i.e., those who, rather than being just passive visitors, perform some purposeful actions typical of the project, game or service under consideration. For example, for a drawing service, it is creation and saving of a new sketch, for a game, playing through at least one level, etc. Only then we will obtain unbiased evaluations of the parameters.

For instance, if we create a virtual prison, we should count only the prisoners who have real prison terms, rather than adding all their relatives, guards, controllers, investigators and lawyers. The latter are random factors in this game.

Fair and equitable calculations will show that for a good project, the K-factor will be equal to about 10% (if it is higher, accept our congratulations!), and the K-retention, to about 90%. The sum of these parameters will yield the sought-for value of 1, the stability level, when the project neither grows, nor withers away. The only thing to be done here would be to increase at least one of the parameters by 1% to make the project increase by 1% daily or weekly. It is known that the daily growth rate of 1% yields a 37-fold increase per year. We call the sum of the above-said two factors the “F-growth”.

3.2. Gamification, Virality and Retention

There are numerous products utilizing the freemium model, such as mobile applications, SaaS solutions, software, web applications and others (Seufert, 2013). However, the freemium model is not as simple as it may seem. The author analyzed the statistics of the users’ behavior in the educational collaborative platform available to everybody as shareware and through the freemium model (Osipov, Volinsky and Prasikova, 2015). The platform is a web site for learning foreign languages, described in the previous section, with users from all

over the World. The main idea of the system is based on the fact that regardless of all the grammar learned in college, students are lacking live interactions with the native speakers to increase their spoken language skills (Osipov, Volinsky and Prasikova, 2015). Finding a native speaker is not an easy task, which typically also requires paying for the tutor lessons. The authors noticed, based on the students studying Spanish, that professional teacher is not required to learn basic communication skills. What's needed is a partner, who's ready to help using already prepared materials, a Spanish native speaker. Spanish native speakers are eager to learn English in exchange for teaching Spanish.

Freemium, which is a combination of the words Free and Premium, business model assumes the maximum product market distribution, along with the capture and retention of the largest possible number of users. Part of the users, which for various products varies from 3% to 10%, takes advantage of the premium features, allowing the creators not only to pay for the entire system upkeep, including free parts, but also to make a profit (Mäntymäki and Salo, 2011).

Figure 10 shows typical cycles of the freemium application. Arrows indicate main user and information flow, including the 4 main cycles:

1. The in-app cycle – the main application cycle, the core cycle, the basic function for which the user decided to use the application (in our case it's learning foreign language with native speakers).
2. The monetization cycle (denoted by the small dollar sign \$ in Figure 10). This is an additional cycle, which attracts the most venturesome people involved in the process, representing additional features. This cycle is smaller, since it is not available to all participating users (especially in the freemium business model).
3. The retention cycle is when users leave and subsequently return into the system. To successfully return and retain the users in the system, special means are utilized, from e-mail notifications, social networks and other communication channels reminders of the events, which occurred during the user absence from the system, to gamification.
4. The viral cycle when existing users invite new users from the external environment (e-mail, social networks, blogs, forums, personal websites, applications, and other communication channels), including the new users accommodation.

Besides, the diagram in Figure 10 also shows different user flows into the web application, including organic “word of mouth” users, bookmarks, search engines, motivated and purchased users, along with the invited users (Ellis and Brown, 2014). The downward arrow shows users lost directly from the web front page, as well as from any other of the mentioned cycles. It should be noted that the app cycles: the core, viral, retention and monetization cycles are antagonistic, as they are competing for the user attention, which is always lacking. The system developers must understand which cycles have priority.

When creating freemium products, there are two main business approaches:

1. Purchasing and other paid users (traffic) attraction. Part of the traffic can be monetized by selling additional premium services and attracting new users by spending the money earned. The key factor in this approach is money, thus a successful monetization model is required to involve a significant percentage of users

in the pay mechanics to maintain the balance. The positive balance is achieved between the revenues from the existing customers minus the cost of attracting new users. Moreover, the cost of attracting new users can be substantial, and there is a risk not to recover this high cost from monetization. Pluses of this approach include fast money earning, and that the K virality factor (K-factor, Reichheld, 2003) can be less than one (discussed below).

- 2. Involving existing users into the product promotion through virality. It is necessary to ensure that the virality coefficient (the K-factor) is significant, which for a number of products is difficult and even unattainable. The volume of users with this approach is growing exponentially until it reaches saturation (Cohen, 2014). The product can contain features from both approaches, with the emphasis on monetization and on expanding the user base. However, given the limited user's attention, one of the approaches must be dominant.

Figure 10. Typical cycles of a freemium application.

3.2.1. Viral User Base Expansion

Let’s consider the second approach, which we call freemium with an emphasis on virality. David Skok (2009a), successful venture capitalist, wrote about the freemium virality-emphasized products: “...in a typical business the single biggest expense is sales and marketing, and recognize that offering a free product/service is an extremely smart way to acquire customers at a low cost that can then be monetized in a different way.” “Another

powerful effect of using the free strategy is that it usually results in a far larger customer base using the free products, who become proponents for your company. This expanded footprint or market share can have a huge effect on the price that acquirers or investors are willing to pay for your company, as they recognize that even though these customers have yet to be monetized, they represent a great potential for future monetization. Twitter and Facebook are two perfect examples of this.” “Another way of looking at the importance of footprint or marketshare is to recognize the importance of market leadership. In the tech industry, market leadership is usually self-reinforcing unless the company does stupid things to annoy its customers. Even if you have gained market leadership by giving away a product/service for free, the financial markets and acquirers realize that market leadership is worth a significant premium over niche players that may have more revenue.”

However, the strategy of viral user attraction cannot be utilized forever. Seufert, the author of the book *Freemium Economics* (Seufert, 2013) presents a concept where the system reaches saturation in terms of the number of users. All efforts invested in the virality mechanics will not bear fruit when the market niche is already saturated, and all potential users either already use the product, or know about it, but prefer not to use it. Obviously, this is the best time to refocus the product and change the user's attention to monetization, which we discussed as the strategy number one.

3.2.2. Virality Realization Methods (Invitations)

The viral marketing requires several components: the sender, the message and the medium for dissemination, including recipients, along with the context in which the message is received.

There are two ways for the user to invite new users:

Open invitations - is the viral mechanism, where the user places invitations in social networks, blogs, personal web pages, etc. addressing an undefined set of individuals.

Direct personal invitations initiated by the existing users to the potential new users using different means of communication by e-mail, personal communication, social networks, SMS, etc. Typically it is hard to account for all open invitations. The author used simplified statistics by calculating how many people were invited by this method, and how many people were able to use this method to initiate invitations. The system calculates how many open invitations were made by each user (via built-in instruments), and how many new users joined as a result (including open invitations initiated by the user and not generated by our system). Table 8 lists the number of published invitation links (open invitations) and how many users post these links on the weekly basis. Statistics reflects only built-in invitation publication mechanism.

Table 9 lists the number of the newly joined users invited through the open links, including all types of invitations. Personal direct invitations allow calculating all parameters and quantifying all steps of the viral cycle. The system accounts for how many users make personal invitations, how many invitations are generated per each user, how many invitations reach the addressee, how many recipients come to the service, and how many register and get involved in the learning/teaching process.

Table 10 lists the number of individual invitations and the number of users that sent such invitations, while Table 11 lists the number of personal invitations per week.

Table 8. The number of published invitation

Personal invited total	1	7	5	9	21	35	131	170	66	90	174	119	110	138	145	132	69	58

Let's define the metrics parameters. The user means registered and authorized user of the service.

dU stands for daily users;

dNU are daily new users;

dAU are daily active users (users who spent more than 5 minutes in the system);

U is the total number of all users;

IU is the number of invited users;

D_i is the total number of invitations per day;

A_iPSU is the average number of invitations per spreading user (A_iPDSU is the same per day);

A_iPU is the average number of invitations per user;

DIU is the number of daily invited users;

IP_i is the ratio of people who accepted an invitation to the number of invitations sent (conversion percentage).

The K-factor conceptually is the average number of additional users introduced to the product by each user (Seufert, 2013, Chapter 7, p. 170). For practical purposes we calculate the K-factor as the ratio between the users attracted through viral methods in a certain time period, to all active users in this time period (Skok, 2009b). Theoretically, we should have used the previous time period, setting it equal to the duration of the viral cycle. However, the length of the viral cycle is difficult to establish, since the reaction to the invitation timeline is very short in our system. In a typical case, sending invitations and accepting them gets completed in one day. For calculating the K-factor, only new users (dNU), or all users in a certain time period (dU) can be used, along with the active users in a certain time period (dAU). The author used active users (not considering uninterested users, who spent very little time in the system) as the base, as it gives the most accurate results in our estimates. For practical purposes some sources used only new users (dNU) as a base, comparing all users attracted virally, to all types of new users. The authors believe this is not quite correct, since all active users contribute to virality and not only new users, thus:

$$Local K_{factor} = \frac{dIU}{dAU} \quad (1)$$

The term K-factor comes from epidemiology, "in which a virus having a K-factor of 1 is in a "steady" state of neither growth nor decline, while a K-factor greater than 1 indicates exponential growth and a K-factor less than 1 indicates exponential decline." (Lee, 2008). The K-factor, which is also called viral coefficient in the literature, can be calculated as the number of invitations sent by each user multiplied by the conversion percentage of the new users (Fong, 2014). For example, if the average number of invitations per user is 5, and 20% of the invitees register in the system, i.e., become new users, then the K-factor = $5 \cdot 0.2 = 1$. Time-independent K-factor averaged over the whole time of system operation the authors call the global K-factor, which is calculated in the following way. The conversion percentage, IP_i is the number of invited people, IU , divided by the number of invitations, i :

$$IP_i = \frac{IU}{i} \quad (2)$$

$AiPU$ is the average number of invitations per user, calculated as the average number of invitations per user, i , divided by the total number of users, U :

$$A_iPU = \frac{i}{U} \quad (3)$$

Then the global K-factor is calculated as the product of the average number of invitations per user, $AiPU$ (equation 3) and the conversion percentage, IP_i (equation 2):

$$Global K_{factor} = A_iPU \cdot IP_i \quad (4)$$

The K-factor dynamics reflects the users' mood swings, and how they react to the introduction, activation or deactivation of one or another viral mechanics, involving them in the activities of inviting new users, and whether these mechanics are well accepted. Thus, for practical purposes the authors utilized the local K-factor, calculated daily. The authors call it the daily K-factor, dK -factor, which is based on the daily active audience, dAU . This daily K-factor is considered the most important parameter of the viral cycle, which was used in the construction of viral mechanisms of the project:

$$Daily K_{factor}, dK = dAU \cdot IP_i \quad (5)$$

Figure 11 shows the i2istudy foreign language educational platform K-factor dynamics in %. It is important to understand that if the K-factor is less than unity (e.g., 50%), in the absence of retention (when the loyalty of existing users is zero), the system growth attenuates.

Figure 11. The i2istudy foreign language educational platform K-factor dynamics in %.

In the best scenario, such virality mechanism partially compensates the users' loss as a result of the normal loyalty retention cycle decrease. This K-factor increases the effectiveness of paid user attraction. For example, purchased 100 paying users get involved in the viral mechanics and invite additional 50 users, which reduced the average price of each user and saved the budget. If the K-factor is greater than 1 (say it is 200%), it leads to the geometric progression growth of the user base. For example, purchased 100 users attract 200 new people, and if K-factor remains the same, the new users will attract 400 new people, and so on. Virality works as long as the entire mass of potential users will not reach saturation in their social matrix and a given market.

3.2.3. Virality, Retention and Monetization Relationship

In his book *Freemium Economics*, Eric Benjamin Seufert in the *Virality and Retention* section, on page 175 said: "Virality and retention exist on opposite sides of the acquisition threshold: virality describes how users are introduced to a product, and retention describes how long users remain with a product. But in essence, both sets of metrics measure the same general sense of delight users feel for a product, manifested in different ways. To that end, virality and retention generally exhibit a positively correlated relationship: products that users are inclined to return to over a long period of time are also likely to be products that users invite others to join."

In our opinion, virality and retention are characteristics amenable to manipulation by the creators of the product. Even a weak product can successfully maintain good retention and virality performance, if appropriate mechanics and effects (impact, gamification) are well integrated into the product and successfully motivate users to these actions. This situation resembles a grocery store, where buyers are manipulated by the layout, marketing, branding, packaging and a discount system, and buy groceries that are not the best and healthy as a result (Glanz, Bader and Iyer, 2012).

Certainly all three parameters: virality, retention and monetization are related. Users with high product loyalty get increasingly involved in the mechanics of virality and monetization (Fields and Cotton, 2012). Despite competition for the user's attention, these mechanisms may spur one another, and all sorts of techniques, such as gamification, which is usually considered in the literature as part of retention, can serve monetization and virality.

Oddly enough, monetization, can also spur virality and retention. For example, premium paid services can be alternatively earned by participation in the viral and gamification programs. The dollar price of these premium options demonstrates their value to the users. For example, when the user knows the cost of acquiring new premium option for real money, it may be easier to motivate the user to earn these premium options by performing certain tasks and actions, such as inviting friends.

It is important that the experience of using the main basic functions of the product cause admiration, then the virality and retention mechanics come into play. If they are unbalanced, for example, with perfect virality and poor retention, the growth of the user base, caused by the successful virality, will compensate for the loss of the same base due to disloyal users. The opposite situation of poor virality with excellent retention leads to the product and its user base stagnation, and eventual defeat by the competitors.

Coefficient of the product audience growth, F-growth, can be expressed as a sum of the coefficients of the viral K-factor and the retention factor, K-retention:

$$F_{growth} = K_{factor} + K_{retention} \quad (6)$$

Equation (6) is the main formula of the freemium product growth, based on the viral spreading. It is clear that this formula does not take into account alternative methods of attracting users, such as paid users and organic users, who came through search engines, word of mouth, or due to the brand popularity. K-retention is always less than one over a long period of time, since no products can retain its audience 100% at all times.

$$Local K_{retention} = \frac{dU - dNU}{dU_{-1}} \quad (7),$$

where dU is the daily audience for a given day; dU_{-1} is the previous day audience and dNU are the new users for this time period. It's convenient to use only active audience for calculations, by taking into account only the new users that have become active, but not all registered users. Similar situation is with the new invited users, among which only active users are accounted for:

$$Local K_{retention_A} = \frac{dAU - dNU}{dAU_{-1}} \quad (8)$$

For example, if the viral K-factor is 20%, and K-retention factor is 90% (i.e., 9 out of 10 people are coming the next day), the growth coefficient will be $0.2 + 0.9 = 1.1$ and the system will grow on its own by 10% of its daily (or other accounting period) audience. Coefficient of the system self growth can be represented as:

$$F_{growth} = \frac{dAU_1 - dNU + dIU}{dAU_0} \quad (9)$$

This is the ratio of the audience from the next period of time without accounting for the new users, but accounting for the users invited by the viral techniques, divided by the audience from the previous time period. If dNU and dIU are equal, then all new users get involved through viral methods exclusively (there is no paid and organic traffic), and in this case:

$$F_{growth} = \frac{dAU}{dAU_{-1}} \quad (10)$$

Table 12. Data and corresponding parameters calculations for the i2istudy project

Table 12 shows the data and corresponding parameters calculations for the i2istudy project. As a side note, it is necessary to take into account that the very properties of the product may be a barrier to its viral spread and reuse. For example, users absolutely don’t want to advertise to their friends that they participate in dating services (Blackhart, Fitzpatrick and Williamson, 2014), which negates any virality efforts. On the contrary, the users promote their morning runs and other physical exercises, even without strong viral mechanics and ingenious motivations (Kamal, Fels and Fergusson, 2014; Loss, Lindacher and Curbach, 2014). An obstacle to the viral spread may be excessive annoyance of the viral mechanics, which can be negatively perceived by the existing users, and even considered as spam by the invitation recipients (Grimes, Hough and Signorella, 2007). In addition, it’s a common mistake to promote business-to-business (b2b) services using virality methods, which usually gives poor results (Davidson, 2014), with the exception of individual cases (Grindeanu, 2014).

Figure 12. The freemium product development diagram in terms of the F-growth factor.

Figure 13. “Invite a friend, earn 30 minutes!” system interface.

If the F-growth factor is less than one, then the product cannot grow and loses users with all the consequences for the product and its team. However, if the team can achieve the F-

growth factor greater than one, the product grows exponentially. It is the ultimate goal for the product team to achieve non-paid user base growth. This is necessary to achieve the project's capitalization exceeding the investment in the purchase of the user base.

Note that the positive F-growth factor can compensate for other shortcomings, such as the quality of the product itself. For the overall project development strategy, investment in virality and retention is an alternative to investments in advertising and public relations, which is often a cost-effective solution, compared with the cost of development (programmers salaries, etc.), marketing and associated staff costs. The freemium product development diagram in terms of the F-growth factor is shown in Figure 12.

When building a freemium product, it is wise to take it to the market and to work out the viral and retention mechanics on small volumes of paid audience, since these mechanics can be easily evaluated statistically and analyzed. Having a positive F-growth, venture capital funds can be attracted, and the project can be brought to a large market (Figure 12). As for our specific product, which was used to conduct these studies, we see that the value of F-growth varies slightly above 40% in Table 12, which is not satisfactory. As a result, the product has been improved, based on the partnership and monetization programs.

4. THREE SIMPLE WAYS TO MAKE A PARTNERSHIP PROGRAM WORK

The authors have launched a partnership program for the i2istudy project, which works at the intersection of communication and education, so that the existing users could involve their friends as newcomers to the project. Successful services use partnership actively and motivate their users to attract their friends on the win-win basis by giving away bonuses and gifts, both to invitees and inviting persons. We were fascinated by the idea and developed an interesting partnership program, but the question was how to attract our existing users to it.

The simplest idea was to place the slogan “Invite a friend, earn 30 minutes!” (Minutes are the internal system currency, which operates as a time bank). Having taken an interest in the proposal, a user would click the link and go over to a special interface with the instruments for posting of open referral invitations and sending of personal links (Figure 13).

This simply didn't work. Although there were some newcomers registered on the basis of referral links, and the users started to send out invitations, the number of invitees was minimal (less than 1%, i.e., the local K-factor was equal to approximately 1-1.5%). The i2istudy project serves the entire World. The authors paid attention to the fact that people react willingly when they are simply asked for help. As soon as one hears the sacred “Could you help?”, s/he is ready to listen to you.

4.1. Method One: Request for Help

We changed the message and generated the following call to action: “Please help our project. We need your help!” Frankly speaking, we added this text just for the sake of an experiment. We were interested in how this concept would function. Recall that we are

talking about the internal interface of the system, where we dealt with our registered and essentially loyal customers.

This phrase certainly needed an explanation, and we added a pop-up window with the following text: “Our project needs new users. We want to grow. We would greatly appreciate you inviting your friends to join. Moreover, we add 30 minutes to your account and the account of the invitee who has accepted your invitation.” The “Help the Project” button was located at the bottom of the window (Figure 14).

The window was not modal and had the closing cross in the top-right corner. Additionally, the window closed in response to a click at any point outside the window boundaries. It is curious that 26% of the customers responded to the “Help our project” call, but simply closed the window upon seeing it. However, the local K-factor increased by almost one percent, i.e., in absolute terms, we started to attract almost twice as many new users. The authors decided to go on with the experiments.

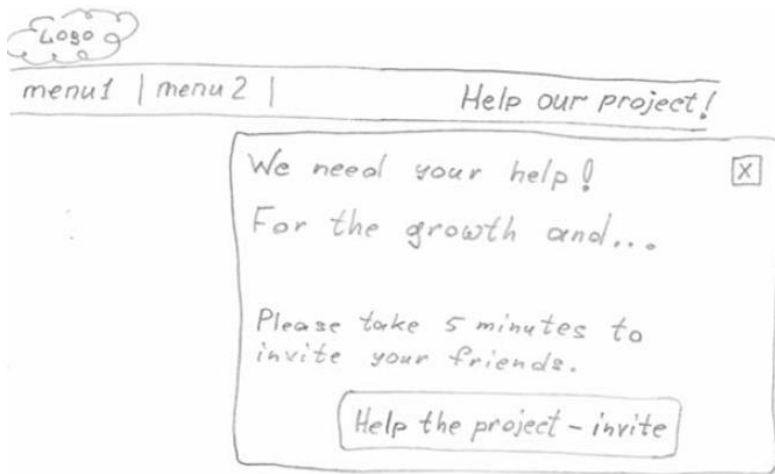

Figure 14. User interface with the “Help the Project-invite” button.

Figure 15. User interface with the “I would *not* like to help” button.

4.2. Method Two: Refuse to Refuse

The authors removed the cross from the window of the corner and made the window modal, i.e., it stopped disappearing in response to clicks outside the window. Moreover, such clicks became nonfunctional, but we added an extra button “I would not like to help” in Figure 15. Thus, a visitor saw only two options now: s/he could either help, or refuse to help us. The catch was, though, that his or her refusal was explicit and obvious. There was no way to skirt the request. It worked! It turned to be a psychological trap, which we drove the user to. They either refused to help, or helped. Few people choose the dark side in real life and we got 73% of positive answers.

Certainly, most of them stopped at the next step, when they saw the interface window for inviting their friends and just did not use it. Nevertheless, the K-factor after this modification was equal to 4%, i.e., we doubled the number of newly attracted users. This is an amazing result for a minor interface trick!

4.3. Method Three: A Perfectionist’s Progress Bar

After a user has invited somebody or just has sent out some invitations, it would be inappropriate to continue asking them to help. However, we implemented the VIP status progress bar, where the user could see the number of joined friends (Figure 16).

Unfortunately, the authors could not determine how this trick increased the level of engagement in the invitation process, since there was no reference to compare the data with. As a tentative appraisal, we can quote this increase as 1000%, since before we used this tool, we had not used the support from people who had helped already. Nevertheless, we measured the local K-factor regularly, and it reached 6.5%.

Remember that the K-factor (virality factor) is the ratio between the number of new users, who are invited by existing users, and the number of the existing users. We calculate the local K-factor for specific time periods, i.e., weeks. With no natural drain of users, the positive K-factor characterizes the viral growth of the system. More detailed information about the virality factor and its interrelation with the drain and retention of users can be found at [toptal.com](http://www.toptal.com/data-science/growing-growth-perform-your-own-cohort-analysis/) (<http://www.toptal.com/data-science/growing-growth-perform-your-own-cohort-analysis/>). Figure 17 shows cohort analysis calculations results from the site.

Figure 16. The VIP status progress bar.

Figure 17. Cohort analysis calculations results.

5. MONETIZATION AS GROWTH MOTIVATOR

Viral growth and monetization can be both competing and complementary mechanisms for the system growth. The i2istudy system, which grew to over 40,000 users, was used to conduct reported experiments and measure corresponding parameters. The user behavior was affected by changing online software system parameters to maximize the number of the system users (Eyal, 2014). Despite the fact that the platform was envisioned as a free application, some monetization elements were stipulated (Skok, 2009a). These paid features are used by a small percentage of users needed to maintain the system.

The authors have studied the statistics of the user behavior in the developed shareware pseudo-free system. While paid features of a typical freemium application are used by 3-10% of users, statistics collected in the i2istudy system was different. From the control standpoint, freemium application is an open system consisting of users and centralized software, which controls human behavior in the system. Herewith, the users are free to participate in the system mechanics or refuse to participate anytime. In our case the purpose of control and

optimization is to maximize the impact of several parameters, which characterize the system. These parameters are the growth of the system user base, reflected by the K-factor, average user time spent in the system over a certain period of time (retention) and system monetization (percentage of paying users and how much they spend).

It is clear that trying to maximize several parameters simultaneously is not a correct approach. Thus, the first objective is to grow the system in terms of the daily or weekly active user and the virality in terms of the K-factor, which reflects how existing users invite new users. The second objective is the system monetization at later development stages when there are enough users. However, the author decided to implement monetization during the system initial growth to study if the existing audience is ready to pay for the premium features.

Figure 18. Initial state of the system and mechanisms for spending and getting minutes.

Figure 19. Additional option to purchase minutes.

Time in minutes available to learn foreign languages from native speakers is the system internal currency. Figure 18 shows the diagram of the system before monetization, where users could only earn minutes in the system by inviting friends and teaching other users. The system consists of the user interface and the users. A new feature was added to positively affect user behavior. The hypothesis was that some users would utilize the new feature. If a large percentage of users utilize the new feature by willingly purchasing minutes, the system is monetized quite well. If this percentage is low, the experiment was unsuccessful.

The control mechanism was realized by changing the interface and some programming algorithms to motivate users by a new function. As a result, the system was changed from the state I in Figure 18 to the state II in Figure 19, which includes additional branch of the possible user behavior algorithm to purchase minutes. As mentioned by Seufert (2013), factors, such as virality, gamification and monetization can enhance each other, increasing user involvement, or be antagonistic and compete for user attention. Thus, different behavioral scenarios, labeled A, B, C and D in Figure 19 can either help or interfere with each other, depending on the situation.

In our case, the system interface was utilized to attract user attention to scenarios A, B and C to improve user involvement in the process. Besides, scenarios B and C represent the core cycle of the application, where users spend most of the time teaching and learning from each other. Scenario A is the part of the interface where users can invite friends to expand the user base and receive bonuses (gamification elements to motivate users to certain actions). Curiously enough, monetization (scenario D) can drive virality and retention in terms of acquiring premium features, also available for money, by participating in viral programs to invite friends. The price of these features reflected in real valuable dollars is encouraging users by clearly demonstrating their value. User motivated by the value of the new function reflected in dollars can be easily encouraged to earn it by performing certain actions of inviting friends, for example.

5.1. Monetization Implementation

To test this hypothesis the author added monetization during the second month after the system launch. Users could now purchase minutes in the system using real money in addition to earning minutes by teaching or inviting friends. This new feature was supposed to motivate users to earn more minutes in the system by teaching their native language and inviting friends. These are two available options A and C in Figure 19 to earn system minutes without spending real money. On the other hand, the new feature should have caused real sales, allowing the developers to earn money (Park, 2011). As mentioned earlier, statistics of successful freemium application sales shows that 3-10% of the users purchase premium features (Ellis and Brown, 2014).

However, since the real money feature implementation, only two \$10 sales took place. This is regardless of the fact that about 24,000 users were registered in the system at the time, and 36% of them were involved in the process of spending and earning virtual system currency, minutes (not all user activity in the system results in spending or earning minutes). Thus, only two users were involved in monetization, which is by no means satisfactory for a freemium product. Please keep in mind that the option to purchase minutes was actively

marketed. In particular, special prompts were added to the system interface, along with informing all users of this new feature by email (Cohen, 2014).

However, regardless of the lack of the virtual currency sales, the demand for other ways to earn minutes increased significantly. In particular, users started to send invitations to their friends more actively. They were offered 30 minutes of bonus system time for each invited registered user. User involvement in the teaching process also increased. Additional 8% of the users indicated that they are willing to teach their native language. Before this profile parameter was filled by 47% of the users. This monetization approach resulted in 55% of the users involved in the teaching process. Thus, adding the option to purchase minutes indirectly improved system parameters of virality and retention, but had no effect on monetization.

The authors were particularly interested in how existing users invite their friends, which was assessed by calculating the K-factor. The K-factor is the ratio of the virally attracted new users and active existing users over a certain time. Kim (2000) identified five types of users: visitor, novice, regular, leader and elder. To calculate the K-factor, one could use only the new users (NU), all users during a certain period (U), or only active users (AU). The authors used only active users to get more accurate results, accounting for the users who passed the “membership ritual” (Kim, 2000). Some sources use only novice users as the base, comparing all virally attracted users with all types of users (Kim, 2000; Rigatuso, 2014). The author did not consider this approach, since all active users contribute to virality, not just the novice users. The weekly K-factor was calculated as (Reichheld, 2003):

$$K_{factor}^{weekly} = \frac{wIU}{wAU} \cdot 100\% \quad (11),$$

where wIU is the number of invited users and wAU is the number of active users in a given week.

Figure 20. User interface with the option to purchase minutes.

Table 13. Data for K-factor calculations for the i2istudy system

Week:	21.04 - 27.04	28.04 - 04.05	05.05 - 11.05	12.05 - 18.05	19.05 - 25.05	26.05 - 01.06	02.06 - 08.06	09.06 - 15.06	16.06 - 22.06	23.06 - 29.06	30.06 - 06.07	07.07 - 13.07	14.07 - 20.07	21.07 - 27.07	28.07 - 03.08	04.08 - 10.08	11.08 - 17.08	18.08 - 24.08
Weekly Active Users (wAU)			297	801	867	979	1080	1213	1827	2126	1763	2672	2572	1924	1716	1810	1576	947
New Active Users (wNU)			239	575	572	643	695	776	1358	1464	1140	1881	1643	1129	998	1066	824	358

K-Factor = wIU/wAU, %			0.88	1.19	1.29	3.05	3.12	2.22	2.31	2.02	4.37	4.48	2.45	3.41	4.26	4.4	3.39	4.37

Figure 21. Weekly K-factor changes.

Mass mailing informing users of the opportunity to purchase minutes in the system started on July 28th, 2014. This action caused a spike in the number of sent invitations to get extra 30 minutes in the system for each invited registered user, which affected the weekly K-factor in Table 13 and Figure 21. As seen in Figure 21, the weekly K-factor increased from $2.01 \pm 0.84\%$ to $3.89 \pm 0.73\%$ after the new feature announcement. The K-factor growth continued until the system was closed on September 1st 2014 for renovation.

To test the hypothesis whether the K-factor changed as a result of monetization, statistical analysis was utilized. The null hypothesis was that the weekly K-factor did not change. The K-factor data before monetization were used as the expected values. The actual K-factor data for comparison were taken after monetization. The calculated p-value was 0.01%, thus the hypothesis that the K-factor did not change as a result of monetization was rejected.

5.2. User Feedback and System Development

It is understandable that the offered monetization model did not work, although it positively affected the system overall. The authors decided to leave this monetization available, but only as the motivating factor for users to earn virtual currency by other means. For real monetization the authors plan to utilize other methods. For example, in addition to the virtual system currency in minutes, there will be user accounts with real money, along with the option to learn and teach for real money, based on the user preferences.

In the event that users will choose the option to teach and learn for money, real money will be credited to the teacher account and debited from the student account. The system will take a commission in this case. The opportunity to teach for money will only become available to teachers after a certain number of teaching hours for virtual system “minutes”.

The teacher will also have to have a good ranking generated from the student assessments at the end of each lesson.

These conclusions were reached after asking the system users. The site contains the red sticky button “Give us your feedback” on the bottom of the screen (Figure 20), which is actively utilized by the users. In 6 months the users left 1824 messages in 4 languages. We analyzed the feedback by dividing it into the following groups (Seufert, 2013; Mäntymäki, 2011):

- 36% contained praise and thank you messages, such as: “Thank you, this is cool”;

- 24% asked about how the system works, or had specific questions about the interface;

- 18% related to technical issues with configuring the hardware (the microphone and the camera) and/or inability to establish audio-video connection with other users;

- 11% contained negative feedback in terms of the complaints connected with other users’ behavior, or requests to close their account;

- 8% contained ideas related to teaching only for money and unwillingness or inability to participate in the language teaching time exchange;

- 4% specific suggestions for system development typically associated with adding other languages: Arabic, French, Italian and Ukrainian;

- 35% other unclassified feedback.

Analysis of this feedback and personal communication with the system users lead to a hypothesis that the majority of users prefer to pay for learning languages due to various reasons. They did not want to participate in the time exchange, which looked so appealing to the system developers. Thus, the developers decided to implement real monetization, reflecting natural organic user needs. There are 8% of users who prefer to pay for their studies due to the unwillingness to teach or lack of demand for their native language. These 8% also include users who want to teach their native language for profit, even small. As a result there was a decision made to add the second currency into the system in terms of the real money and allow users to teach for profit. The system will allow adding real money to the system, and getting paid as well.

The initial attempt to monetize system by changing the user interface and adding a new feature affected the system in an unexpected way. Adding the option to purchase internal system currency (minutes) using real money did not result in significant sales, but motivated users to utilize alternative ways to earn this virtual currency. It was expected that the users would either utilize or not utilize this option without changing the system performance parameters. However, this resulted in the unexpected growth in viral mechanics of inviting friends. The rate of attracting new users increased as a result of the offer to purchase virtual currency. Thus it was observed that direct motivation for the certain action within the system was ignored, but changed other indirect parameters (system growth in this case). It is quite clear and obvious that given several alternatives to obtain the virtual currency, the users choose the most advantageous and simple ones for them. However, the viral system parameters improvement just due to the unrealized option to purchase minutes is an interesting and ill studied effect.

CONCLUSION

The authors have developed and implemented freemium real time e-learning system for practicing foreign language speaking skills with native speakers. The idea that two unfamiliar with each other people can carry on a conversation without knowing a common language, guided by a computer program, turned out to be viable. The described platform allows combining high quality lessons and live human interaction with the native speaker. These lessons have been custom developed specifically for the i2istudy system by the professional teachers. The system also facilitates individual tutoring, the most expensive service in the World, without involving real exchange of money, based on the language training barter between the teacher and the student.

Developed application is of interest for the majority of users, and allows maintaining a prolonged dialogue between the users in a given language. This definitely allows developing speech communication skills in a foreign language. Regardless of the stereotype that quality foreign language education can only be provided by the professional teacher, the developed system demonstrates that it is also convenient for users to study together. In this case, similar to the teaching materials presented in a text book, or interactive recorded media, professional teacher is recruited to develop teaching materials, while users can use these materials for training and practice. However, it is more interesting and encouraging doing this with others, since the social effect also gets employed. Based on the conducted experiments, users not only spend more time in the system, but invite their friends to join them.

The authors suppose that similar ways of teaching could partially substitute individual tutoring and/or be used as training to improve oral communication skills. It is concluded that the system should be developed further and recommended as the speech improvement tool. At the same time it is clear that the system is not a good fit for every user, since some people are very shy and cannot communicate with strangers, even when provided with pre-defined communication scenarios.

Conducted studies present the new methodologies to assess gamification tools in the e-learning systems. The developed e-learning system not only allows conducting quality training, but presents an opportunity for statistical analysis of different parameters, contained in the log files, to assess the effectiveness of technical and pedagogical tools. Application popularity with users and growth of the number of users both act as assessment for the system motivation elements and tools.

When building a freemium product, it is wise to take it to the market and to work out the viral and retention mechanics on small volumes of paid audience, since these mechanics can be easily analyzed and statistically evaluated. After achieving adequate F-growth factor, venture capital funds can be attracted, and the project can be brought to a large market.

APPENDIX. A FEW WORDS ABOUT THE I2ISTUDY SYSTEM

What is i2istudy?

This is an international club where people learn foreign languages from each other. i2istudy is the newly developed open educational resource for learning foreign languages

from native speakers. The learning is achieved using pre-defined educational materials through live interaction between the teacher and the student. This is why the system is called i2istudy, “eye to eye”, based on the peer-to-peer principle. The method is based on the patented technology, which allows learning basics of the foreign language from scratch, or enhance foreign language proficiency in a short period of time.

Let’s ask a question: What does every person know and use every day? The answer is obvious - their native language. Thus, every person can be called an expert in his or her native language. However, can any native speaker teach other people? At a first glance, the answer is no, since: a) the teacher needs to know how to teach and b) the teacher needs to know a foreign language to communicate with the student. The i2istudy allows native speakers to teach others without knowing how to teach and without knowing foreign languages. In other words, i2istudy allows all native speakers, not necessarily professional teachers, to teach their native language in a network setting. Every user is the teacher and the student at the same time. As a student the person learns foreign languages, and as a teacher s/he teaches others their native language. The system is based on the latest available web technology.

Why is the Service Currently Free?

Because i2istudy uses the principle of time banking. Here anyone can be a teacher or a student. As a student, you learn the foreign language. As a teacher, you teach your native language. It’s barter! Besides, internal system currency in “minutes” is automatically tracked. It’s like a computer game, which also offers entertainment. A housewife from Florida can teach a student from Argentina for 27 minutes, and then learn Spanish for 27 minutes in return. A man from Berlin can teach his friend from Moscow, who teaches a teenager from Cairo Russian and so on.

How to Learn and How to Teach?

“How to learn - it’s clear! How am I going to teach my native language and prepare lessons? I don’t know how to do it!” - this is the most frequent question that people ask.

You Do Not Need to be a Professional Teacher to Teach Your Native Tongue!

Since every lesson has been thoroughly written out in advance by professional teachers, all the assignments have been prepared, the pictures and videos - selected, the teacher doesn’t need to prepare for the lesson, but simply read the information shown by the system and follow written instructions. That is why the lesson can be conducted by anyone, who speaks the language fluently! This is why only native speakers teach on i2istudy! Moreover, because of the well thought-out system of hints, even a beginner can communicate with a native speaker!

How Can You Earn Money with i2istudy?

Some people say: “I don’t have time for teaching. I only want to learn a foreign language!” or “Why learn other languages? I speak English. It’s enough for me.” If you don’t want to share your time, you can just teach your native language and earn money!

Additional Information

The system interface allows adding any number of languages by simply translating the existing lessons. There is no need to recreate new lessons. All the user needs to do is select the native language and the language to be learned, and learn from native speakers. The system currently supports English, Russian, German and Spanish languages.

In conclusion, i2istudy is the platform, which competes with thousands of online offers to teach foreign languages through Skype.

Business model: users pay each other for learning foreign languages. The project provides a place to find a teacher/student, live communication aids (live audio and video), teaching and learning materials, and billing (time and \$ tracking, paying and getting paid). The project takes commission from money transactions, similar to AirBnB or Uber, but in language education.

Chapter 45

**SECONDARY EFL LEARNERS' EXTRACURRICULAR
L2 CONTACT AND THEIR SELF-BELIEFS
CONCERNING ORAL NARRATIVE COMPETENCIES:
ANALYZING RELATIONS AMONG CONSTRUCTS –
CLARIFYING THE ROLE OF LANGUAGE
PROFICIENCY AND GENDER**

Günter Faber*

Institute of Educational Psychology
Leibniz University Hannover, Germany

ABSTRACT

In the EFL context, the learners' extracurricular contact with the L2 is considered both an important goal and a substantial means to develop and optimize their foreign language acquisition. From a cognitive-motivational perspective the extent and intensity to communicate in a foreign language outside the EFL classroom will not only depend on the learners' language skills, but will also be strongly affected by their related self-beliefs. In particular, their perceptions of their own competencies as well as their apprehension concerning the use of the English language should decisively regulate their actual willingness to communicate in the L2. Besides pertinent listening, pronunciation, vocabulary or grammar skills, in particular, the learners' oral narrative competencies and their related self-beliefs, respectively, should claim a central role in determining their L2 contact. However, as previous EFL research could incrementally differentiate L2 competence beliefs and anxieties into several specific subcomponents (such as speaking, reading, or writing beliefs) and could clearly demonstrate the relationships of these sub-components with the foreign language learners' relevant achievement and proficiency levels – the issue of oral narrative competence beliefs and anxieties appears to be barely analyzed. Moreover, little is known about their contribution to explain interindividually existing differences in EFL learners' extracurricular L2 contact. Therefore, the present

* Corresponding Author Email: faber@psychologie.uni-hannover.de.

study aims at clarifying these relationships. In a sample of $N = 256$ German ninth-graders from 9 inner-city grammar schools the relations between their related competence beliefs, anxiety, teacher ratings of their relevant L2 skills, and their extracurricular L2 contact were analyzed. For concurrent validation, measures of their L1 and L2 self-concept were also included. Using structural equation modeling method the results could show the learners' L2 contact being directly explained by their self-perceptions of oral narrative competencies, which appeared to be directly affected by their anxiety concerning oral narrative situations. The anxiety variable, in turn, could be directly predicted by the teacher rating of learners' speaking skills. Hence, the L2 speaking skills had no direct impact on the learners' L2 contact, but were sequentially mediated by their oral narrative self-beliefs and their apprehension or fear of failure concerning oral narrative situations. Furthermore, multiple group comparison could demonstrate these relationships among variables to be invariant across gender. Taken altogether, the present findings stress the need for conceptually and methodologically more complex research designs to intensely unravel the developmental pathways and educational effects of EFL learners' extracurricular L2 activities.

INTRODUCTION

In the EFL context, the learners' extracurricular contact with the L2 has to be considered both an important goal and a substantial means to develop and optimize their foreign language proficiency. Correspondingly, Dörnyei and Csizér (2005) point out the learners' language contact outside the foreign language classroom being a key factor in language acquisition – as it offers a wide range of opportunities for using English language in more or less natural communication settings and, thereby, vitally contributes to practicing and enhancing linguistic skills. In particular, from the conceptual perspectives of relevant language acquisition theories the learners' extracurricular contact with the L2 English should be expected to be mostly informal and implicit in nature and, therefore, should allow to facilitate the learners' foreign language use in terms of everyday input experiences and output performance (Krashen & Terrell, 1983; Swain, 1985). That way, the learners should also increasingly advance to internalize the culturally constructed mediating artifacts (or mental tools) of the native speakers' social community (Lantolf & Thorne, 2008). Similarly, from the viewpoint of social psychology, the extracurricular L2 contact should lead to positive changes in the learners' attitudes and behavior concerning the native speakers' community. Following Allport's prominent contact hypothesis (1954) it should be assumed, that the frequency and quality of intergroup contact with L2 speakers would enable the learners to better understand the foreign culture, and, therefore, would opportunely affect their motivational orientations and interpersonal competencies towards L2 native speakers as well as towards their language (Pettigrew & Tropp, 2005). Accordingly, for EFL research the issue of extracurricular L2 contact appears to constitute one important issue which has to be extensively analyzed with regard to these theoretical assumptions. In detail, there is considerable need for empirical clarification of the type of L2 activities outside the EFL classroom learners are preferably engaged in, its individual determinants, its actual effects on foreign language acquisition processes or proficiency outcomes, respectively, and its impact on the learners' foreign language attitudes.

Over the past decades, various studies have already investigated EFL learners' extracurricular L2 contact across most diverse educational settings, learner samples, and cultural

backgrounds. However, they rather differ in the way of conceptualizing and operationalizing the contact variable. Whilst some studies in the field just analyzed the self-reported frequency and quality of direct interactive contact with native speakers outside the foreign language classroom (Clément, Dörnyei & Noels, 1994; Clément & Kruidenier, 1985; Dörnyei & Csizér, 2005; Onwuegbuzie, Bailey & Daley, 1999), other studies additionally included the learners' indirect contact experiences with L2 sources – in particular, by considering their extracurricular exposure to books and newspapers, TV and radio programs, films, video games, music, and internet websites (Barbee, 2013; Bonney, Cortina, Smith-Darden & Fiori, 2008; Cheng, 2002; Csizér & Kormos, 2008a; Dörnyei, Csizér & Németh, 2006; Illes & Csizér, 2010; Kim & Margolis, 2000; Koolstra & Beentjes, 1999; Spada, 1986; Sundqvist, 2009b; Sylvén & Sundqvist, 2012). In most cases, the type and frequency of indirect L2 contact was inquired by means of self-report questionnaires, in single cases also one-week language diaries were used (Sundqvist, 2009b; Sylvén & Sundqvist, 2012). Altogether, those studies which approached to unfold the indirect contact variable conceptually appeared more plausible and empirically yielded more productive results, inasmuch as the majority of EFL learners might experience only minimal opportunities to directly interact with native speakers. Moreover, the exploration of indirect L2 contact sources captures the learners' exposure to relevant cultural products and artifacts of the native speakers' community – which should play a crucial role in the internalization of linguistic and non-linguistic constructs of the foreign culture. Actually, in most studies the learners admitted to have only rare direct language contact and reported a more frequent exposure to indirect contact sources. In particular, outside the EFL classroom they more strongly preferred the use of audio-visual and online media than of print products (Barbee, 2013; Csizér & Kormos, 2008b; Kormos & Csizér, 2007; Sundqvist, 2009b).

Substantially rooted in a cognitive-motivational or social constructivist framework of academic learning (Wigfield, Eccles, Schiefele, Roeser & Davis-Kean, 2006), especially based on a theoretical perspective on the foreign language learning process being essentially determined by the mutual interplay among individual aptitudes, skills and beliefs (Dörnyei, 2005), the relevant studies in the field mostly analyzed the relations of extracurricular L2 contact both with measures of language proficiency and language learning motivation. Across these studies the motivation variables broadly covered the issue of EFL learners' self-beliefs, in particular, their competence and control beliefs as well as their affective (prevalently anxious) appraisals of their individually existing learning experiences – e.g., the learners' self-confidence, perceived competence or self-efficacy, affective and instrumental values, intrinsic learning motivation or motivated learning behavior, and foreign language classroom anxiety (Dörnyei, 1998; Gabillon, 2005; Horwitz, 2001; MacIntyre, MacMaster & Baker, 2001; Williams & Burden, 1997). Furthermore, with regard to the inconsistency of pertinent research findings (Faber, 2013), some studies also examined the role of the learners' gender:

- At all, surprisingly few studies had analyzed the relation between the EFL learners' L2 contact outside the classroom and their foreign language proficiency or achievement outcomes. Two studies could substantiate a positive relationship between secondary learners' exposition to extracurricular L2 sources with their English listening and writing competence, respectively (Vez, Piñeiro & Rodríguez, 2013; Vickov, 2015). The results from two other studies with adult samples could not demonstrate any substantial achievement differences depending on the frequency of extra-

curricular language activities (Barbee, 2013; Spada, 1986). However, considering the effect of playing English worded video games during leisure time, frequent gamers from fifth grade classrooms displayed a higher amount of vocabulary knowledge, reading and listening comprehension (Sylvén & Sundqvist, 2012). Similarly, another study reported significant gains in vocabulary and word recognition for a group of elementary school children watching English TV programs with L1 subtitles. Admittedly, the experimental design of this study was not in line with the research focus on extracurricular language contact (Koolstra & Beentjes, 1999).

- Likewise, only few studies had analyzed the L2 learners' competence beliefs. Their results could demonstrate significant, but low to moderate relations between the amount of extracurricular foreign language contact and the learners' self-confidence, self-evaluation of proficiency or self-efficacy. In turn, the frequency of L2 contact could be significantly explained by the learners' integrative attitudes concerning the foreign language and culture (Clément, Dörnyei & Noels, 1994; Clément & Kruidenier, 1985; Sundqvist, 2009a; Sylvén, 2006).
- With respect to the EFL learners' motivational orientations one relevant study revealed no substantial correlations with their extracurricular language contact (Kim & Margolis, 2000). Compared with this, two studies from the Hungarian EFL context could demonstrate significant motivational differences depending on the frequency of L2 contact. Those learners who reported a higher level of effort, persistence and enjoyment in foreign language learning engaged in extracurricular activities more frequently. Moreover, multivariate analyses could show only direct spoken, not indirect L2 contact to significantly predict the learners' motivated learning behavior (Csizér & Kormos, 2008a,b; Illés & Csizér, 2010).
- Furthermore, just two studies had examined the L2 learners' anxiety with respect to their extracurricular language contact. Whilst one study could demonstrate only a weak relation between the writing anxiety and the frequency of university students' exposure to indirect language sources (Cheng, 2002), the other study could not find any significant relation between L2 contact and the learners' foreign language anxiety (Sundqvist, 2009a).
- Finally, due to the small number of empirical findings, the role of L2 learners' gender remains rather unclear. As one study with eighth-graders could demonstrate the girls reporting a significantly higher frequency of extracurricular L2 contact, other studies with ninth-graders could not find any overall differences between girls and boys. However, interestingly there were significant correlations between extracurricular L2 activities and the learners' oral proficiency and vocabulary measure for the boys, but not for the girls. This special finding possibly might indicate a moderator effect of the gender variable (Sundqvist, 2009b; Sundqvist & Wikström, 2015).

To summarize, in view of the theoretically emphasized importance of EFL learners' extracurricular L2 contact the output of these empirical studies appears to be more or less meager and, in particular, yields very inconsistent information. Moreover, as these studies had been conducted in most diverse educational tracks and cultural backgrounds, they cannot claim having produced any representative results. Their results are not really able to adequately clarify the developmental determinants and educational consequences of EFL learners' ex-

tracurricular language activities. Undoubtedly, first of all there is a need for more research efforts. Moreover, the analysis of extracurricular L2 contact must be refined and relevant investigations should, therefore, generate alternate research perspectives – which should systematically tend to overcome the conceptual and methodological shortcomings of the present studies.

Accordingly, future research should be more strongly guided by sound conceptual frameworking which allows for integrating currently well evidenced models of language learning and language learning motivation and, thus, might warrant a nomologically embedded consideration of the extracurricular L2 contact variable. In EFL research appropriate empirical analyses are already available – e.g., modeling the multiple associations among several aptitude, proficiency, and motivation or anxiety variables (Clément & Kruidenier, 1985; Gardner, Masgoret & Tremblay, 1999; Gardner, Tremblay & Masgoret, 1997; Khodadady & Khajavy, 2013; Pae, 2008; Peng & Woodrow, 2010; Piniel & Csizér, 2013). Hence, empirical analyses of the learners' extracurricular L2 contact should follow these conceptual and methodological features and specifically modulate them. Merely bivariate analyses will not reflect the structural and processual complexities of construct relations and, therefore, are potentially at risk to leave important information undiscovered or to misread given information (Howitt & Cramer, 2011). Only the multivariate modeling of the L2 contact variable's relations with the learners' language competencies and motivational orientations will adequately contribute to unravel the developmentally and educationally relevant pathways among constructs (Gardner, 2000) – by scrutinizing the L2 contact variable's multiple dependencies on relevant competence and motivation constructs as well as its multiple effects on relevant competence and motivation constructs.

In particular, the multivariate modeling of relations allows for exploring and analyzing potential mediator and moderator effects among variables (Baron & Kenny, 1986). Thus, the direct and indirect impact of different learner variables on the frequency and quality of their extracurricular L2 activities and, in turn, its direct and indirect impact on the learners' competencies and motivational orientations might be identified. Correspondingly, in a multivariate study with eighth-graders learning German as a foreign language Csizér and Kormos (2008b) could substantiate an indirect impact of their self-confidence on the frequency of their L2 contact outside the classroom. Similarly, an earlier study of Clément and Kruidenier (1985) could evidence the mediating role the language learners' extracurricular L2 contact in explaining their motivational orientations. In each case, these mediator effects appear to vitally differentiate and specify the modeling of construct relations under consideration.

Furthermore, even though appropriate multivariate research efforts will analyze the EFL learners' extracurricular language contact, they essentially should pay more attention to the issue of causal interpretation. With reference to the input and output hypotheses of relevant language acquisition theories (Krashen & Terrell, 1983; Swain, 1985), previous research in the field had, in most cases, implicitly assumed the L2 contact variable to operate as an antecedent variable affecting the learners' competencies and motivational orientations. However, as the relations between L2 contact and learner variables must be principally expected to be reciprocal in nature, the extracurricular contact variable conceptually and empirically should be treated both as an independent and dependent construct. In particular, the later research perspective might contribute to gain important insights into interindividually existing differences among EFL learners and, thus, might help to clarify relevant linguistic and motivational precursors of their actually realized extracurricular L2

activities. The identification and analysis of such personal determinants should, in turn, conceptually and empirically enhance the understanding of L2 contact effect modalities. Up to now, only in rare cases relevant studies had investigated the L2 contact variable that way (Clément & Kruidenier, 1985; Csizér & Kormos, 2008b).

Another crucial problem of the causal interpretation of research findings concerns the study design's temporal feature. Strictly speaking, only the analysis of longitudinal data allows the relations among constructs to be causally interpreted. Accordingly, research on EFL learners' extracurricular language contact should be prospective in nature and, thus, should assess its relevant data at two measurement times, at least. Previous research in the field, however, had used cross-sectional data. Hence, its results cannot make any claims regarding the direction of relations among constructs. Nevertheless, the conceptual interpretation of cross-sectional data could be substantially elaborated by using *a priori* predictions of construct relations. Cross-sectional studies on EFL learners' extracurricular language activities should benefit from a theoretically comprehensible framework being proper, in each case, for the development of reasonable hypotheses about the assumed direction of relations between the contact variable and related competence or motivational variables. Certainly, this conceptually arguable approach to test explicit hypotheses about the direction of construct relations will lead to an interpretation of cross-sectional data in terms of theoretically derived perspectives within a given framework and, thereby, will help to examine relevant elements of theoretical models – but it will never compensate or even substitute the scope of longitudinal analyses.

Likewise, an important issue of EFL research on the learners' extracurricular language contact refers to the level of construct specificity. If at all, previous studies in the field mostly had analyzed relevant competencies by means of various test instruments measuring specific skills such as vocabulary and oral fluency (Spada, 1986; Sundqvist, 2009b; Sundqvist & Wikström, 2015), or reading and listening comprehension (Sylvén & Sundqvist, 2012). Compared with this, their measurements of relevant motivational orientations operated on a general level of construct specificity – e.g., by analyzing the L2 manifestations of language attitudes, competence beliefs (Clément & Kruidenier, 1985; Csizér & Kormos, 2008b; Dörnyei, Csizér & Németh, 2006; Sundqvist, 2009a), intrinsic motivations (Barbee, 2013; Csizér & Kormos, 2008b; Illes & Csizér, 2010; Kim & Margolis, 2000), and anxieties (Clément, Dörnyei & Noels, 1994; Onwuegbuzie, Bailey & Daley, 1999; Sundqvist, 2009a). Only in one study, the learners' language anxiety had been assessed on a task-specific level (Cheng, 2002). However, against the background of conceptual and empirical developments in educational psychology (Lau, Yeung, Jin & Low, 1999; Marsh & O'Mara, 2008a; Mills, Pajares & Herron, 2006) and foreign language research (Cheng, Horwitz & Schallert, 1999; Dörnyei, 1998; Ehrman, 1996; Julkunen, 2001) the EFL learners' motivational orientations must be considered multidimensional or multifaceted in nature and, therefore, should be operationalized in a more task- or situation-specific manner – e.g., with respect to distinct subcomponents of cognitive-motivational self-beliefs about a certain linguistic competence (such as listening, reading, writing, or speaking). As these specific subcomponents had been demonstrated to be stronger associated with relevant competence or proficiency measures than overall indicators of L2 motivation, they were able to relatively explain a higher amount of variance in construct relations under investigation (Cheng, 2004; Holder, 2005). Thus, previous studies on EFL learners' extracurricular language activities might have achieved less differentiated

findings. In particular, they might have been prone to potentially underestimate the associations among contact and motivation variables.

Moreover, future research efforts on EFL learners' extracurricular language contact should more strongly consider the role of gender. Though most previous studies in the field could not sufficiently clarify this issue, two studies, at least, could indicate the learners' gender to moderate the L2 contact variable's relations with relevant competence and motivation variables (Sundqvist, 2009a,b; Sundqvist & Wikström, 2015). This potential moderation effect, which possibly might be a result of gender stereotyping in the formation of language competencies and motivations (Meece, Glienke & Askew, 2009; Rätty, Kasanen & Kärkkäinen, 2006; Schmenk, 2004) as well as in the choice and maintenance of foreign language activities outside school, should further be examined. In particular, multivariate analyses conducting multiple group comparisons (Kline, 2011) between male and female learners, should advance in determining the role of gender. Apart from this special methodological perspective, in order to gain more consistent and representative results, EFL research in the field should consider the gender variable throughout.

Not least, as previous studies in the field had analyzed the issue of extracurricular L2 contact across most diverse learner samples and educational settings (ranging from secondary school to university level), their results hardly appear to be comparable and, consequently, cannot warrant to reveal any representative information. Probably, adolescent secondary school and adult university students' motivation to learn a foreign language will emerge from rather different individual and contextual determinants and, hence, will not reflect the construct in the same manner. From a developmental perspective, more comprehensive analyses within a certain educational context are needed. Only their findings should allow for drawing valid conceptual and empirical inferences with regard to the EFL learners' extracurricular language activities in a given academic, social, and cultural environment (Dörnyei, 2009).

EXTRACURRICULAR L2 CONTACT AND LEARNERS' SELF-BELIEFS: CONCEPTUALIZING THEIR RELATIONS

EFL research had mostly considered the learners' extracurricular language activities as an independent variable which was expected to positively affect their language competencies and attitudes or motivational orientations, respectively. In order to clarify the individually and contextually operating factors which may contribute to the learners' actually realized extracurricular L2 activities the reverse research perspective should feature just as important. In particular, it should help to analyze the impact of the learners' language competencies and motivational orientation on the choice of certain contact sources and the intensity using them in everyday situations. Principally, it may be assumed that learners' who have achieved a relatively high proficiency level and, therefore, also have evolved a stronger motivational willingness to engage in foreign language communication, would like to more frequently and more intensely get involved with extracurricular L2 sources. However, as relevant empirical findings could demonstrate, achievement or competence variables and motivational orientations will not independently or equally contribute to explain interindividually existing differences in subsequent learner variables. Instead subsequent learner variables will be

directly predicted by motivational orientations, which, in turn, appear to be directly affected by achievement or competence variables (Ahmed, Minnaert, Kuyper & van der Werf, 2012; Clément & Kruidenier, 1985; Faber, 2012a,b). Hence, within a given conceptual framework of construct relations the impact of individual achievement or competence variables should be largely mediated by the learners' motivational orientations. Such mediator effects are in line with the assumptions of social cognitive or social constructivist theories – which concordantly emphasize the crucial role of subjective appraisals, expectancies or interpretations in determining academic learning processes (Bandura, 2001; Pintrich, 1999; Wigfield, Eccles, Schiefele, Roeser & Davis-Kean, 2006; Williams & Burden, 1997; Zimmerman & Cleary, 2009).

Accordingly, the construct of motivational orientations requires further conceptual clarification. From a social cognitive perspective it refers to the learners' self-beliefs such as their subjective expectancies, explanations, and values of academic activities and outcomes (Wigfield & Eccles, 2002). As outlined elsewhere (Faber, 2012a), they substantially concern the individually emerged perceptions of competence and control with respect to a certain educational setting. Developmentally, they can be understood both as consequences of previous academic experiences and as antecedents of future academic outcomes (Pintrich, 2003). Theoretically, they can be defined as expectancy-value constructs which predict to a large extent how an academic situation is being either approached or avoided. Therefore, they considerably contribute to regulate the learners' individual engagement and learning behavior in the long term (Wigfield, Eccles, Schiefele, Roeser & Davis-Kean, 2006; Zimmerman & Cleary, 2009).

Among these self-beliefs, the learners' academic self-concept has been evidenced as a cognitive-motivational key variable. In terms of self-perceptions and self-evaluations of own competencies, it is assumed to be multifaceted in nature and to be comprised of distinct sub-concepts or components – which refer to the learners' competence beliefs in a certain academic domain, subject, or with respect to a certain type of academic task. Accordingly, in numerous educational and psychological studies these domain- or subject-specific self-concept facets could be empirically separated (Marsh & O'Mara, 2008a; Marsh, Xu & Martin, 2012). Across most diverse research designs and learner samples, they have been consistently demonstrated to explain a higher amount of achievement variance than general measures of academic self-concept or global self-esteem (Möller, Pohlmann, Köller & Marsh, 2009; Valentine, DuBois & Cooper, 2004).

Furthermore, in the case of individually accumulated failure experiences in a certain domain, subject or type of task, the learners' relevant self-concepts will decline and, thus, indicate lowered competence beliefs or success expectancies – which will, in turn, lead to increasingly emerging expectancies of personal threat. The learners, then, will fear not to master the task at hand and anticipate inevitable failure. These biased expectancies of failure outcomes may manifest as individually noticeable worry and avoidance cognitions, negative emotional states, and feelings of physiological arousal (Liebert & Morris, 1967) – and, thus, will eventually bring the formation of persisting test anxieties (Faber, 2012a; Zeidner, 1998). Likewise, individually established anxieties are assumed to negatively affect the level of competence beliefs as well. That way, decreasing self-concepts and increasing anxieties must be considered as mutually reinforcing risk factors which might seriously impair the learners' academic development and attainment in the long term. In particular, high-anxious learners suffer from reduced working memory capacities, engage more strongly in task-irrelevant thoughts

during task completion and, in total, tend to use less adaptational coping strategies (Ikeda, Iwanaga & Seiwa, 1996; Richards, French, Keogh & Carter, 2000; Schwarzer, 1996; Zeidner, 1998). As the learners' competence beliefs will be processed in a domain- or subject-specific manner, their test anxieties also will. Correspondingly, the construct validity of domain- or subject-specific test anxiety measures had been well documented – e.g., with regard to test anxiety in mathematics, spelling, science, computer use, and sport (Beckers & Schmidt, 2001; Britner, 2010; Faber, 2012a; Güzeller & Doğru, 2012; Ko & Vi, 2011; Sparfeldt, Schilling, Rost, Stelzl & Peipert, 2005; Smith, Smoll, Cumming & Grossbard, 2006). Moreover, some studies could further unfold the construct and identify distinct subcomponents within a certain domain or subject (Gierl & Bisanz, 1995; Pajares & Urdan, 1996; Wigfield & Meece, 1988).

The formation of academic self-concepts and anxieties, however, does not only depend on the learners' success or failure experiences but also on their gender – thus, leading to more or less pronounced differences between males and females in a certain academic domain or subject. In the mathematics and science domain, males consistently reported higher self-concepts. Even when existing achievement differences were statistically controlled for, these differences favoring the male learners remained (Hergovich, Sirsch & Felinger, 2004; Skaalvik & Skaalvik, 2004; Wilgenbusch & Merrell, 1999). In the verbal domain, gender differences are less clear. Though empirical findings mostly could evidence females to display significantly higher verbal competencies, this advantage did not appear to be consistently associated with higher levels in their self-concepts (Hergovich, Sirsch & Felinger, 2004; Jacobs, Lanza, Osgood, Eccles & Wigfield, 2002; Skaalvik & Skaalvik, 2004; Wilgenbusch & Merrell, 1999). In particular, these findings might indicate the ruminative effects of gender role stereotypes on the females' motivational processing (Baron, Schmader, Cvencek & Meltzoff, 2014; Pomerantz, Altermatt & Saxon, 2002). Similarly, significant anxiety differences could be demonstrated between male and female learners. Across a wide range of learner samples, educational settings, and cultural backgrounds females reported a higher level of test anxiety (Bandalos, Yates & Thorndike-Christ, 1995; Hembree, 1988; Seipp & Schwarzer, 1996; Zeidner, 1998).

In EFL research, the empirical analysis of the learners' motivational orientations concerning their extracurricular language activities should broadly follow these conceptual issues and, consequently, build a domain-specific framework of relevant construct perspectives – in particular, considering the domain- or task-specific differentiation of L2 self-concepts, test anxieties, and their relations to the learners' gender.

L2 Self-Concepts

According to the assumption of a multidimensional and multifaceted self-concept construct (Marsh & O'Mara, 2008a) the domain-specific validity of self-concept measures in the EFL context had been widely proven. The L2 self-concepts could be demonstrated being sufficiently distinguishable from the competence beliefs in other academic areas (Faber, 2012b; Holder, 2005; Marsh, Kong & Hau, 2001; Möller, Streblow, Pohlmann & Köller, 2006; Rost, Sparfeldt & Schilling, 2007). Furthermore, empirical findings could separate L2 self-concept variables from other subject-specific facets of academic self-concept. They also could demonstrate them to correlate with various performance variables in a domain-specific manner (Marsh, Kong & Hau, 2001; Möller, Streblow, Pohlmann & Köller, 2006; Onwueg-

buzie, Bailey & Daley, 2000a; Rost, Sparfeldt & Schilling, 2007). However, a large part of previous EFL research likewise had analyzed the learners' academic self-perceptions in various aspects but used a rather wide array of construct conceptualization and operationalization modes. Though these variables at least a posteriori may be interpreted as merely rough indicators of L2 learners' academic competence beliefs, their relationships to relevant performance and proficiency measures turned out to be low to moderate in magnitude. Compared with the correlational findings of recent self-concept research (Möller, Pohlmann, Köller & Marsh, 2009), these results seemed to underestimate the relations between self and achievement variables – a fact that might be attributed to such methodological limitations as they may arise from biased study samples, lacking control of confounding variables, and the use of less differentiated composite scores or highly aggregated construct features (Clément, Dörnyei & Noels, 1994; Clément & Kruidenier, 1985; Dörnyei & Kormos, 2000; Gardner, Tremblay & Masgoret, 1997; Tremblay & Gardner, 1995). However, apart from these methodological caveats, the L2 self-concept construct could be further differentiated into distinct subcomponents which refer to the perception of listening, speaking, reading, and writing performance (Holder, 2005; Laine, 1988; Lau, Yeung, Jin & Low, 1999; Mori, 2002; Rahimi & Abedini, 2009). Hence, in order to analyze the learners' L2 self-concept in a most proper and valid way, EFL research should pursue this conceptual approach and examine the construct both on the level of general and task-specific components.

L2 Anxiety

In coping with foreign language demands, learners with low competence expectations commonly should experience a higher degree of language apprehension and, thus, begin to foreseeably develop an increasing fear of negative social evaluation, cognitive worry and emotional tension, which in turn can contribute to a longer-term stabilization of a sustainably unfavorable learning behavior (Horwitz, Tallon & Luo, 2010; MacIntyre & Gardner, 1989). Numerous studies had been able to prove substantial relations between L2 self-concepts and foreign language anxiety variables. These findings could confirm once more the conceptual affinity and processual interplay between both constructs, therefore also the domain-specific nature of foreign language anxiety (Goetz, Cronjaeger, Frenzel, Lüdtke & Hall, 2010; Marsh & Yeung, 1996; Matsuda & Gobel, 2004; Sparfeldt, Schilling, Rost, Stelzl & Peipert, 2005). L2 learners' language anxiety could still be empirically separated from a general test anxiety variable (Horwitz, 2001). It only moderately correlated across different foreign languages and was associated with significantly lowered language outcomes (Al-Shboul, Ahmad, Nordin & Rahman, 2013; Gardner, 2007; MacIntyre & Gardner, 1994; Rodriguez & Abreu, 2003; Sparfeldt, Schilling, Rost, Stelzl & Peipert, 2005). As several studies dealing with the L2 learners' willingness to communicate (MacIntyre, 1994; MacIntyre, Clément, Dörnyei & Noels, 1998; MacIntyre, MacMaster & Baker, 2001) could show, it comparably appeared to contribute to individually existing differences in everyday language use. However, the willingness to communicate in a foreign language could be substantially predicted by the learners' self-confidence and anxiety scores – indicating this construct to represent a causally subsequent composite which mediates the motivational consequences of competence and threat expectancies. Therefore, its conceptual uniqueness should be further clarified (Hashimoto, 2002; MacIntyre & Charos, 1995). With regard to distinguishable subcomponents of the

foreign language anxiety construct, EFL research had first and foremost examined the degree of emotional tension and fear of failure in L2-typical speech and oral communication situations (Brantmeier, 2005; Gkonou, 2014; Horwitz, 2001; Kim, 2009; McCroskey & Richmond, 1991; Subaşı, 2010; Williams & Andrade, 2008; Woodrow, 2006; Young, 1986; Wilson, 2006) but could meanwhile also integrate the learners' fears of reading and writing or interpretation requirements into their analyses – and, thus, had also been advanced to empirically support this further differentiation (Cheng, 2002; Cheng, Horwitz & Schallert, 1999; Chiang, 2006; Elkhafaifi, 2005; Mills, Pajares & Herron, 2006; Saito, Horwitz & Garza, 1999; Zoghi & Alivandivafa, 2014). However, relevant measures of foreign language anxiety occasionally fail to adequately reflect the essential worry and emotionality components which processually will constitute the test anxiety construct (Deffenbacher, 1980; MacIntyre, 1999). Future EFL research in the field should pay more attention to this issue. Here again, EFL research dealing with the motivational analysis of L2 learners' extracurricular language activities should examine the anxiety construct both on the level of general and task-specific components.

L2 Proficiency, Self-Beliefs and Gender

Across most diverse grade levels and educational tracks the female students consistently displayed better outcomes in learning English as a foreign language than male students (Hartig & Jude, 2008; Huerta, Tong, Irby & Garza, 2012; Lehmann, Gänsfuß & Husfeldt, 2011; Gu, 2002; Nikolova, 2011; Schilling, Sparfeldt & Rost, 2006; Winkelmann & Groeneveld, 2010; Zaunbauer, Retelsdorf & Möller, 2009). However, whilst some studies reported significant self-concept differences favoring the female language learners (Dörnyei & Clément, 2001; Dörnyei, Csizér & Németh, 2006; Du, 2012; Heinzmann, 2009; Henry, 2009; Schilling, Sparfeldt & Rost, 2006), other studies could demonstrate only minor or no gender differences in the L2 self-concept – even when the females clearly outperformed their male classmates (Daniels, 2008; Faber, 2012b; Helmke, Schrader, Wagner, Nold & Schröder, 2008; Holder, 2005; Krätschmar, 2010; MacIntyre, Baker, Clément & Donovan, 2002; Skaalvik & Skaalvik, 2004; Yeung, Lau & Nie, 2011; Zaunbauer, Retelsdorf & Möller, 2009). Compared with this, research results on the L2 anxiety and the willingness to communicate construct draw a much more confusing picture. As some studies could demonstrate the females to report stronger as well as lower anxieties (Campbell & Shaw, 1994; Öztürk & Gürbüz, 2013; Park & French, 2013), other studies could not substantiate any gender differences (Matsuda & Gobel, 2004; Onwuegbuzie, Bailey & Daley, 2000b; Woodrow, 2006). Moreover, in one particular study the males' higher anxiety appeared to interact with grade level (MacIntyre, Baker, Clément & Donovan, 2002). In principle, this inconsistency of research findings might be largely traced back to conceptual and methodological characteristics of studies and, in particular, on relevant differences among learner samples under consideration. For instance, the impact of gender might vary with the learners' age and their educational context. Hence, the gender-dependent formation of foreign language anxieties will probably differ between compulsory school and university students. To unravel these complexities with regard to the analysis of L2 learners' extracurricular language activities, EFL research should consider the moderating role of gender affecting the interplay among competence and self-belief variables.

Modeling the Relations among L2 Constructs

Against this domain- and task-specific background of conceptual perspectives and empirical findings, the L2 learners' extracurricular language activities will be analyzed as a dependent variable within a framework of relevant competence and self-belief variables. The learners' self-beliefs are represented as task-specific competence beliefs and anxious worry and emotionality responses. According to a cognitive-motivational perspective of construct relations, it is assumed the L2 contact variable being strongly affected by task-specific competence beliefs and anxieties, which will, in turn, be directly affected by related language competencies (Figure 1). In EFL research, similar mediator effects of self-belief and anxiety variables have been already evidenced elsewhere (Clément & Kruidenier, 1985; Faber, 2012b; Khodadady & Khajavy, 2013; Peng & Woodrow, 2010; Piniel & Csizér, 2013), but with respect to the L2 contact variable they seem to be mostly neglected, so far. The contribution of self-belief and anxiety variables to explain interindividually existing differences in extracurricular language activities, however, allows to generate a twofold set of research hypotheses: On the one hand, individually accumulated success or failure experiences may lead to the formation of positive or negative competence beliefs concerning a specific task or demand, which predict the individual level of anxiety. On the other hand, individually accumulated success or failure experiences may lead to the development of task-specific anxieties, which directly predict the level of competence beliefs. Conceptually, both directions may claim to adequately realize the construct relations under consideration (Figure 1) – though the hypothesis of a direct impact from competence beliefs on subsequent anxieties is in line with assumptions from social-cognitive theory and, moreover, has been empirically supported in various studies (Faber, 2012a; Goetz, Frenzel, Hall & Pekrun, 2008; Goetz, Pekrun, Hall & Haag, 2006; Tóth, 2007; Yashima, 2002; Yashima, Zenuk-Nishide & Shimizu, 2004). In any case, among L2 competence beliefs and anxieties mediation effects should operate and, thus, largely explain interindividually existing differences in the learners' extracurricular language activities. Correspondingly, the learners' L2 proficiency level, namely their specific language competencies concerning a particular academic task or demand, will not directly affect the L2 contact variable (Figure 1). That is, L2 learners will more frequently and intensely use extracurricular language sources if they perceive themselves as relatively competent – and, besides, if they suffer from negative feelings of language apprehension and test anxiety only to a minor extent.

Finally, within this modeling perspective of construct relations, the learners' gender might contribute to explain interindividually existing differences in their extracurricular L2 activities both in a direct and indirect manner. First of all, the learners' gender appears to directly affect the relevant competence, self-belief and contact variables by engendering mean differences. Thus, females and males should significantly differ with respect to the level of their task-specific competence, their perceptions of task-specific competencies, their task-specific worry and emotionality responses, and their frequency of extracurricular language activities (Figure 1).

Figure 1. Theoretically assumed model of construct relations.

However, due to the ambiguous research results in the field, the direction of gender differences is hardly to predict. Hence, concerning this issue the modeling of construct relations will be rather explorative in nature. Furthermore, subtle gender differences might also emerge as a result of a motivational bias. As female learners commonly are more likely to perceive themselves defensively and were more likely to discount their competencies (Bornholt, Goodnow & Cooney, 1994; Stetsenko, Little, Gordeeva, Grasshof & Oettingen, 2000; Stipek & Gralinski, 1991; Tiedemann & Faber, 1995), they are more prone to internalizing and ruminative reactions in the face of academic failure (Broderick, 1998; Crosnoe, Riegle-Crumb & Muller, 2007; Frenzel, Pekrun & Goetz, 2007; Kiuru, Leskinen, Nurmi & Salmelo-Aro, 2011). Accordingly, female learners reported internal distress primarily after academic failure to a significantly greater extent than male learners (Pomerantz, Altermatt & Saxon, 2002). Therefore, those research findings which could not demonstrate any gender differences in L2 self-beliefs might be explained by a typically operating gender bias in the cognitive-motivational processing of individually experienced failure. Only at the same (poor) achievement level females would display comparatively weaker competence beliefs and higher anxieties than their male counterparts. Thus, the possible impact of gender bias in L2 self-beliefs should depend on the learners' individual achievement or proficiency level – at least, previous analyses could substantiate this effect with respect to the L2 self-concept and the anxiety concerning oral narrative classroom situations (Faber, 2012c, 2013). Additionally, the learners' gender will indirectly affect the relevant construct relations by moderation. Between females and males, the relations among constructs will then significantly differ in their magnitude and (possibly) their direction (Figure 1). Hence, such correlational differences would reflect empirically distinct pathways to explain females' and males' extracurricular L2 activities – confirming the particular findings of Sundqvist (2009b), the role of foreign language competencies and self-beliefs would turn out to create a gender-specific pattern in predicting the preference and the use of extracurricular L2 sources. Developmentally, the fact of a gender-dependent pattern determining the relations among constructs would inevitably

address the clarification of relevant socialization effects far beyond the matter of foreign language use (Meece, Glienke & Askew, 2009; Rätty, Kasanen & Kärkkäinen, 2006; Williams, Burden & Lanvers, 2002).

THE PRESENT STUDY

Oral Narrative Competencies and Extracurricular L2 Contact

With regard to the domain- and task-specific conceptualization of L2 learners' competencies and self-beliefs, a considerable research gap still exists in the analysis of their extracurricular language activities. Anyhow, as previous EFL research in the field had considered task-specific constructs only in rare cases – in particular, oral narrative competencies and related self-beliefs had not yet been investigated. Though oral narrative competencies in the EFL context are considered both an advancing language goal and an increasingly important medium of language instruction (Celce-Murcia, Dörnyei & Thurrell, 1995), no suitable empirical findings are available. This fact must be all the more surprising as EFL research could almost point out, that L2 learners generally perceive the demands of oral language use as highly apprehensive and threatening (Awan, Azher, Anwar & Naz, 2010; Aydin, 2008; Brantmeyer, 2005; Dörnyei & Kormos, 2000; Koch & Terrell, 1991; Liu & Jackson, 2008; Mercer, 2011; Philipps, 1992; Tanveer, 2007). All the more, this issue will apply to oral narrative situations.

Producing appropriate oral narratives in the foreign language requires a wide range of the learners' linguistic and non-linguistic skills. They must have elementary language skills (such as pronunciation and vocabulary), conversational skills (such as cohesion and coherence), actional skills (such as expression of feeling and reporting relevant information), and strategic skills (such as self-monitoring and self-regulating behavior). In a narrow sense, EFL learners must intentionally use these competencies to produce successful oral narratives (Celce-Murcia, Dörnyei & Thurell, 1995). In order to achieve an appropriate level of coherent storytelling, they need to actively leverage various linguistic, affective, cognitive and narrative tools – e.g., considering the causal sequence of the story told, offering adequate orientation clues to the audience, or evaluating the narrative content by means of affective markers as well as speaking fluently or pronouncing words correctly (Pavlenko, 2006; Ruhm, 2014).

Furthermore, the learners' oral narrative productions will be performed within a certain social setting and will therefore be publicly evaluated by the audience's attentiveness and feedback. Over time, L2 learners will experience their oral narratives being successful or failing and thus will develop specific self-beliefs. They will perceive themselves as more or less capable to tell stories, and they will evaluate the narrative situation as more or less apprehensive or even threatening (MacIntyre, 1999; Zeidner, 1998). Hence, L2 learners will gradually develop self-relevant perceptions of their own narrative competencies and anxious expectancies – e.g., due to their individually existing worry to confound the causal ordering of narrative elements or their fear to pronounce incorrectly. These task-specific self-beliefs will, in turn, regulate their approach to narrative activities either in a more mastery-oriented or in a more failure-avoiding way. Accordingly, L2 learners will considerably differ in their perceptions of oral narrative competencies and their anxiety concerning oral narrative

situations. In previous analyses, both variables had been demonstrated to be associated with relevant L1 and L2 constructs in a domain-specific manner. In line with conceptual assumptions, they appeared, moreover, to strongly correlate. Within a framework of related competence and self-belief constructs the learners' anxiety concerning oral narrative situations was directly affected by their foreign language competencies and, in turn, could significantly predict their self-perceptions of oral narrative competencies (Faber, 2012c). Poor achieving language learners are more prone to worry about their mastery of narrative situations and, thereby, to primarily expect narrative or communicative failure outcomes.

Interindividually existing differences in these task-specific self-beliefs should, then, also affect the learners' extracurricular L2 contact. Depending on their oral proficiency level they will more or less suffer from anxious feelings and lowered competence beliefs concerning oral narrative situations and correspondingly engage in foreign language activities outside the classroom. In particular, high anxious learners should tend to use L2 sources less frequently – and should, especially, tend to avoid types of L2 direct contact which require either spoken or written modalities of interactive language use.

OBJECTIVES OF THE STUDY

Due to this emphasized lack of appropriate empirical research in the field, the present study aims at analyzing the relations of L2 learners' task-specific competencies and self-beliefs with their extracurricular language activities. Following Csizér's and Kormos' (2008a) conceptual approach, these activities concern both direct and indirect types of L2 contact. In the course of a broader research project with regard to the characteristics and determinants of oral narrative competencies at the end of the secondary school level (Faber, 2009; Ruhm, 2014), measures of relevant competence beliefs, anxious responses and competencies in the L2 were drawn on. To sufficiently clarify their domain-specific validity, correspondent self-belief and competence measures for the L1 German were additionally included. From this discriminant validation perspective, the oral narrative competence and self-belief variables in the L2 should sufficiently claim domain-specificity when their correlations among each other would turn out to be distinctly stronger than with the matched L1 variables. Only with this premise, the analysis of construct relations would adequately reflect the EFL context. Furthermore, the students' gender was considered.

In particular, the present study addresses the following issues concerning the L2 learners' extracurricular language activities:

- First of all, the frequency of the learners' exposure to the L2 extracurricular sources under consideration shall be analyzed and, thus, related preferences in using these sources shall be explored.
- Frequencies and preferences in the use of L2 sources shall be further analyzed with respect to gender differences.
- For subsequent analyses, by calculating a composite score of all relevant items a L2 contact scale shall be built and psychometrically examined.
- The statistical fit of a structural model of construct relations, with the task-specific competence and self-belief measures as independent variables and the L2 contact

measure as dependent variable (Figure 1) shall be tested. Accordingly, in this model perspective it is assumed the L2 contact variable being directly affected by the learners' perceptions of oral narrative competencies and their anxiety concerning oral narrative situations. Both self-belief variables, in turn, are expected to be directly affected by the learners' L2 competencies, whereas there will be no direct relation between the L2 competencies and the L2 contact variable. Similarly, a general L2 self-concept variable is assumed not to be substantially related to the L2 contact variable. Among the L2 competence variables oral skills shall best predict the L2 contact variable. Not least, within this modeling approach the matched L1 competence and self-belief variables are hypothesized to play no crucial role in explaining the L2 contact variable.

- Further, potentially moderating effects of the learners' gender on relations among constructs shall be analyzed.
- With regard to differentially emerging gender differences, it is assumed the females reporting less frequent extracurricular L2 contact in the high anxiety and the low competence belief group, respectively, than their male counterparts.

METHOD

Participants

The study was conducted with a sample of $N = 256$ students (144 female, 112 male) from 20 ninth-grade grammar school classes of a large urban catchment in Germany. In the German tripartite system of strongly selective educational tracks this school type ("Gymnasium") is the highest track. The students' average age was 15.0 years ($SD = 0.5$), ranging from 14 to 16 years. Their participation was on a voluntary basis and only with explicit parental consent. The predominant majority of participating students ($N = 222$) declared themselves to be born in Germany. With respect to the English and German achievement measures, the students who were not born in Germany did not significantly differ from the other students (t-tests for independent samples: $p > .05$). The number of students stating English to be their family language was $n = 1$ (0.4%) and, thus, negligibly small.

Procedure

The L2 contact and both the L2 and L1 self-belief data were gathered in the course of two class periods by two (advanced collegiate) test supervisors who had been instructed in detail prior to the beginning of the test. This took place class for class and in the absence of the teaching staff. The L2 and L1 competence data were collected by the teaching staff in charge with corresponding questionnaires.

Instruments

For assessing the learners' extracurricular L2 activities eight four-point rating items were used. They referred to the frequency (ranging from "never" to "often") the learners' commonly were exposed to certain sources of direct and indirect language contact outside school (Table 1). Against the background of relevant empirical findings, these items mainly dealt with indirect contact types – in particular, various print, mass and internet media. In order to get an appropriate composite scale for further analyses, with all contact items a principal component analysis was conducted. Due to the eigenvalues ($e_1 = 2.587$, $e_2 = 1.157$, $e_3 = 0.947$) its result revealed a clear one-factor solution explaining 32.33% of total variance. However, as two items were deleted because of insufficient item-test-correlations, the final scale consisted of 6 items (Table 1). Its internal consistency calculated with Cronbach's coefficient alpha turned out to be just acceptable (Table 2).

The L2 learners' task-specific self-beliefs were assessed by means of an 18-item questionnaire. Its items were supposed to reflect the typical demands of narrative classroom situations, and to contain corresponding statements with respect to the narrative process as regards content and linguistics (Faber, 2012c). In particular, the competence-related items were phrased relating to the logical structuring of narrative content, the availability of appropriate linguistic means, the context-dependent certainty in narrative skills, and the effect upon the audience.

Table 1. L2 extracurricular contact items: Results of principal component analysis

In my leisure time (or in my vacancies)...	a	h^2	r_{it}
L2CON 01 I visit English-speaking countries.	.338	.666	.207
L2CON 02 I use English language at home or with friends.	.590	.502	.424
L2CON 03 I watch TV news in English language.	.664	.446	.475
L2CON 04 I read books or journals in English language.	.592	.355	.396
L2CON 05 I watch English-speaking films.	.695	.532	.497
L2CON 06 I hear radio programs in English language.	.446	.222	.286
L2CON 07 I visit English-speaking websites.	.508	.619	.315
L2CON 08 I mail or chat in English language.	.627	.400	.447

Note. a = factor loading, h^2 = communality, r_{it} = corrected item-total correlation

The anxiety-related items addressed the central component of worry and emotionality as well as corresponding avoidance cognitions. The answers to the questionnaire items were given by marking a six-point Likert scale (ranging from "does not apply at all" to "applies in full"). The results of principal component analysis led to the formation of two subscales. Eleven items could be used to build the subscale for measuring the learners' perceived oral narrative competencies (PONC). Sample item: "It's easy for me to find the right words immediately." Learners with high scores perceived themselves to be sufficiently capable of conveying the respective narrative content in a consistent, linguistically adequate, and certain

manner. Seven items could be used to build the subscale for measuring the students' worry and emotionality concerning oral narrative classroom situations (WEOS). Sample item: "I feel quite uncomfortable that others are listening to me." Learners with high scores perceived these situations as rather threatening and expected failure to master them. Hence, they reported a higher degree of avoidance thoughts. For both subscales, the internal consistencies turned out to be rather adequate (Table 2). Contrary to the PONC scale, the sum scores of the WEOS scale appeared to be not normally distributed and displayed a clear positive skew (Table 2). Thus, by trend, relatively fewer learners reported higher levels of anxiety – which fundamentally corresponded to the theoretically expected distribution of this variable.

Table 2. Descriptive statistics, reliabilities (Cronbach's alpha), and standard errors (SE) for all scales measuring the learners' self-beliefs, L2 extracurricular contact, and language competencies

	AM	SD	z_{skewness}	z_{kurtosis}	α	SE
SCL2E	58.5	14.7	-2.9	-1.7	.94	3.6
SCL1G	60.3	13.9	-2.7	-1.5	.92	3.9
PONC	41.4	9.6	1.5	0.3	.88	3.3
WEOS	20.9	8.9	2.1	-2.8	.90	2.8
L2CON	13.3	3.2	0.7	-0.1	.70	1.8
TCRL2E	28.7	6.4	0.1	-1.5	.95	1.4
TCRL1G	29.3	6.4	-1.0	-0.9	.95	1.4

Note. SCL2E = Self-Concept in English, SCL1G = Self-Concept in German, PONC = Self-Perceptions of Oral Narrative Competencies, WEOS = Worry and Emotionality Concerning Oral Narrative Classroom Situations, L2CON = Extracurricular Contact with L2, TCRL2E = Teacher Competence Ratings in the L2 English, TCRL1G = Teacher Competence Ratings in the L1 German

The academic self-concepts in the L2 English and the L1 German were gathered using 14 six-point Likert items for each language. They addressed the extent of the learners' subjective competence expectancies with regard to meeting academic demands. The wording of the items was strictly parallel. No explicit social or dimensional comparisons were verbalized. Sample item: "I try hard in English/German, but I do not perform very well." In the majority, these questionnaire items originate from pertinent time-tested scales, and they were presented here in the economical grid style format (Faber, 2012b; Möller, Streblow, Pohlmann & Köller, 2006; Rost, Sparfeldt & Schilling, 2007). A principal component analysis (with varimax rotation) confirmed a two-factor solution allowing for a clear distinction between both subject-related self-concept facets. It was possible to form two scales for measuring subject-specific academic self-concepts whose internal reliability was highly sufficient, in each case (Table 2). High scale scores indicated the learners' positive perceptions and evaluations of their own subject-specific competence which also included sufficient numbers of options of dealing with challenges and difficulties turning up in the process (Faber, 2012c).

The results of an additionally conducted confirmatory factor analysis using three item parcels (Bandalos, 2002) showed an appropriate fit of the measurement model ($\chi^2/df = 1.211$, TLI = 1.00, CFI = 1.00, RMSEA = 0.029).

Concerning relevant L1 and L2 competence aspects, the respective teaching staff was asked to complete a questionnaire concerning the students' proficiency level in the L2 English and the L1 German. For each subject, the items tapped the learners' skills in listening, speaking, pronunciation (L2 only), reading, spelling, grammar, and composition (Faber, 2009). In terms of principal component analysis (with varimax rotation), these subject-specific competence ratings could clearly be separated. Both factors could explain nearly 80% of the total variance. The internal reliabilities of both scales appeared to be highly sufficient (Table 2). The learners' gender was included as a dummy variable (coding: male = 1, female = 2) in the analyses.

Data Analyses

First of all, for analyzing the frequencies and preferences of the learners' exposure to extracurricular L2 sources, overall descriptive statistics were calculated. With regard to all contact items gender differences were examined as well – using two-sample t-tests (Ruxton, 2006). In order to adequately control familywise Type I error rate, the alpha level for determining statistical significance was adjusted with Bonferroni's correction (Abdi, 2007). Additionally, for all pairwise comparisons Hedges' g (1982) was calculated as effect size which pools the n -weighted standard deviations of each subgroup under consideration (Durlak, 2009).

To further test the assumptions concerning the relations among constructs (Figure 1), multivariate analyses were conducted by means of the structural equation modeling (SEM) approach. With SEM method it was possible to control the covariations between all variables with respect to their empirical overlap, thus unraveling the complexity of their relationships (Kline, 2011). For determining the relations among latent variables as well as between manifest and latent variables standardized beta-weights were calculated. The overall fit of the model, hence the discrepancy between the theoretically assumed model structure and the empirically received data, was estimated with various fit parameters. Following conventional rules of thumb in structural equation modeling, a sufficient model fit should be achieved when the χ^2/df value is lower than 3, the Tucker-Lewis index (TLI) is higher than .90, the comparative fit index (CFI) is higher than .90, and the root mean square error of approximation (RMSEA) is at least lower than .08 (Marsh, Hau & Gravson, 2005). As manifest measurement indicators the related scale items, in the case of the L2 English and L1 German self-concept variables as well as the L2 English and L1 German teacher ratings of language competencies two item parcels were used (Bandalos, 2002). Due to the non-normal distribution of the WEOS outcomes, bootstrapped estimations of standard errors for all parameters were used to obtain approximately unbiased significance values (Nevitt & Hancock, 2001; West, Finch & Curran, 1995). The conceptually hypothesized model of construct relations was examined by conducting three sequential steps of analysis: at first, the relations of L2 English and L1 German competence and self-belief variables with the L2 contact variable were simultaneously examined – in order to test the subject-specificity of foreign language variables. As the self-concept items in each subject were all identically worded, the

error terms between the English and German latent variables were allowed to correlate (Marsh, Martin & Debus, 2001). Secondly, relations among all L2 variables were examined – in order to test possible mediator effects of task-specific competence beliefs and anxiety responses. Thirdly, these relations were further examined considering, in particular, the role of the L2 speaking variable to explain interindividually existing differences in the L2 contact variable. Moreover, this final analysis was performed as a multiple group comparison – in order to examine the potentially moderating role of gender. All SEM analyses were conducted with the AMOS software (Arbuckle, 2011; Byrne, 2010).

And finally, to further clarify possible gender differences in the L2 contact variable, and also to explore potential nonlinear relations, two-way analyses of variance (ANOVA) with the learners' gender and self-beliefs as factor variables for the L2 contact scores as dependent variable were calculated. Moreover, to uncover potentially existing differences in the learners' L2 contact among these self-belief groups post hoc multiple comparisons should be performed – using the Scheffé test which appears to be the most flexible and robust, though rather conservative procedure (Kirk, 1982).

L2 contact differences between females and males within each self-belief level should, then, be analyzed with two-sample Welch t-tests (Ruxton, 2006). Here again, relevant difference hypotheses should be tested against an alpha-corrected level of significance (Abdi, 2007).

Among the L2 contact items, the self-belief items and the teacher competence ratings there were only few missing data (amounting at most to 4.3%). As these missings did not produce any systematic pattern they were treated as “missing at random” (MAR). For the structural equation modeling analyses they were automatically compensated by means of the full information maximum likelihood estimation procedure (FIML) available from the AMOS software (Enders & Bandalos, 2001). For all other analyses, missing values were estimated by means of the two-step iterative EM algorithm (Enders, 2010). Though this method appears to be at risk to underestimate the standard errors of imputed data, in view of the small number of missing values, its application seemed to be just advisable.

RESULTS

L2 Extracurricular Contact: Frequencies and Preferences

Initially calculated descriptive statistics of the L2 contact items could demonstrate websites and films being the most preferred extracurricular language sources – followed by reading books or journals and mailing or chatting (Table 3). Apparently to a lesser extent, the remaining contact types were used.

The direct contact with native speakers or, at least, English speaking people was rarely reported. The same applied to watching TV news in English language. However, watching TV news might tap an activity adolescent learners would like to neglect in general. According to that, the L2 learners obviously preferred indirect language sources outside school. Only in the case of mailing or chatting they were needfully involved in interactive contact situations. In particular, the learners' use of this type of L2 contact should reflect its important role in everyday peer culture.

Table 3. Frequencies, standard deviations, and ranking order of the L2 extracurricular contact items

In my leisure time (or in my vacancies)...	AM	SD	Rank
L2CON 01 I visit English-speaking countries.	1.99	0.92	5
L2CON 02 I use English language at home or with friends.	1.90	0.85	6
L2CON 03 I watch TV news in English language.	1.86	0.89	7
L2CON 04 I read books or journals in English language.	2.40	0.90	3
L2CON 05 I watch English-speaking films.	2.55	0.95	2
L2CON 06 I hear radio programs in English language.	1.52	0.81	8
L2CON 07 I visit English-speaking websites.	3.04	0.93	1
L2CON 08 I mail or chat in English language.	2.00	1.06	4

Note: AM = arithmetic mean, SD = standard deviation

Table 4. Gender differences concerning L2 extracurricular contact items and the L2 extracurricular contact total sum score

In my leisure time (or in my vacancies)...	Males AM	Females AM	t	p	g
L2CON 01 I visit English-speaking countries.	1.87	2.08	-1.76	.080	0.23
L2CON 02 I use English language at home or with friends.	1.87	1.92	-0.48	.634	0.06
L2CON 03 I watch TV news in English language.	1.99	1.75	2.17	.031	0.27
L2CON 04 I read books or journals in English language.	2.09	2.63	-4.87	.000	0.62
L2CON 05 I watch English-speaking films.	2.59	2.51	0.64	.525	0.08
L2CON 06 I hear radio programs in English language.	1.50	1.55	-0.55	.583	0.06
L2CON 07 I visit English-speaking websites.	3.40	2.75	5.86	.000	0.74
L2CON 08 I mail or chat in English language.	2.30	2.15	1.10	.271	0.14
L2CON Scale (total sum score) Items 02, 03, 04, 05, 07, 08	13.44	13.11	0.79	.427	0.10

Note. AM = arithmetic mean, t = t-value, p = significance (2-tailed), g = Hedges' effect size. Only p-values in bold face meet the adjusted alpha level ($\alpha' = .006$).

L2 Extracurricular Contact: Gender Differences

In order to get most differentiated results, gender differences in the learners' extracurricular L2 contact were analyzed considering both the level of items and the total scale score. Using pairwise t-tests for independent samples only two items indicated differences between female and male learners, which met the alpha-adjusted level of significance (Table 4). As a result, females more frequently reported to read books or journals in English language – and males more frequently stated to visit English-speaking websites. With respect to the total score of the L2 contact scale, no significant gender difference could be found.

Correlations among Constructs

For the total sample zero-order correlations among constructs revealed a clear subject-specific pattern. Among each other, the L2 competence and self-beliefs appeared to be closer associated than with the concurrent L1 variables (Table 5). As conceptually expected, the sum scores of both the perceptions of oral narrative competencies and the anxiety concerning oral narrative classroom situations did not represent constructs independent from each other. Rather, their sum scores turned out to be substantially correlated. Furthermore, the learners' extracurricular L2 contact was much stronger related to the L2 self-concept and the self-perceptions of oral narrative competence than with the L1 self-concept – thus, indicating the criterion validity of these scales. However, the same did not comparatively hold for the anxiety scale. In particular, this special finding might hint at a relevant mediator effect.

Modeling Overall Construct Relations

In order to comprehensively test the hypothesized relations among constructs (Figure 1) structural equation modeling analyses were conducted. For all measurement models, which were used the analyses, the standardized regression coefficients of manifest indicator variables turned out to reach most acceptable values and were all statistically significant (Table 6).

In a first step, the contribution of L2 and L1 competence and self-concept variables to explain interindividually existing differences in the learners' L2 contact variable were examined – thus, testing the subject-specific validity of constructs. The SEM result could demonstrate the L2 contact variable being exclusively predicted by the L2 self-concept variable. The L2 self-concept variable was, in turn, strongly affected by the L2 competence variable. Path coefficients across subjects did not play any role. The relations among latent variables clearly drew a subject-specific pattern. This model fitted the data in a quite acceptable manner (Figure 2). Accordingly, the L2 contact variable actually reflected a foreign language context rather than a more general scenario of the learners' extracurricular language activities. However, within this model of construct relations, its empirical variance could be explained only to a limited extent.

Table 5. Zero-order correlations among the self-belief, L2 extracurricular contact, and competence variables

	SCL1G	PONC	WEOS	L2CON	TCRL2E	TCRL1G
SCL2E	.38***	.69***	-.59***	.28***	.58***	.35***
SCL1G		.33***	-.27***	.10	.34***	.67***
PONC			-.67***	.38***	.48***	.26***
WEOS				-.19**	-.42***	-.24***
L2CON					.19**	.02
TCRL2E						.53***

Significance: *** $p \leq .001$, ** $p \leq .01$

Note. SCL2E = Self-Concept in English, SCL1G = Self-Concept in German, PONC = Self-Perceptions of Oral Narrative Competencies, WEOS = Worry and Emotionality Concerning Oral Narrative Classroom Situations, L2CON = Extracurricular Contact with L2, TCRL2E = Teacher Competence Ratings in the L2 English, TCRL1G = Teacher Competence Ratings in the L1 German

Table 6. Standardized beta-weights for the measurement models of latent self-belief, L2 extracurricular contact, and competence variables

SCL2E	SCL1G	PONC	WEOS	L2CON	TCRL2E	TCRL1G
.905	.913	.881	.791	.455	.943	.974
.958	.926	.908	.615	.538	.964	.934
		.810	.795	.522		
			.652	.664		
			.865	.467		
			.802	.510		
			.759			
Item Parcels	Item Parcels	Item Parcels	Items 1-7	Items 2-5, 7-8	Item Parcels	Item Parcels

All standardized beta-weights are significant ($p \leq .001$).

Note. SCL2E = Self-Concept in English, SCL1G = Self-Concept in German, PONC = Self-Perceptions of Oral Narrative Competencies, WEOS = Worry and Emotionality Concerning Oral Narrative Classroom Situations, L2CON = Extracurricular Contact with L2, TCRL2E = Teacher Competence Ratings in the L2 English, TCRL1G = Teacher Competence Ratings in the L1 German

In a second step, the contribution of all L2 variables to explain interindividually existing differences in the learners' L2 contact variable was examined. As the SEM result could show, the L2 contact variable was most strongly affected by the learners' perceptions of oral narrative competencies. They could be, in turn, best predicted by their anxiety concerning oral narrative classroom situations. Both task-specific self-belief variables were directly affected by the L2 competence ratings. Thus, the impact of learners' language competencies on their extracurricular language activities was essentially mediated by their task-specific self-beliefs.

With regard to the L2 self-concept variable a rather similar pattern of relations could be found. Though it was not associated with the L2 contact variable and could not incrementally contribute to explain its empirical variance. In terms of the level of construct specificity, this finding was completely in line with conceptual assumptions. Here again, the model fitted the data in a quite acceptable manner (Figure 3).

In a third step, in order to further differentiate the modeling of construct relations, the role of the L2 speaking variable to explain interindividually existing differences in the L2 contact variable was examined. The speaking variable referred to the teacher perception of learners' competence to use free speech in the EFL classroom. This particular modeling perspective was also used to test the potentially moderating effect of the learners' gender. Correspondingly, a multiple group analysis was driven – thus, comparing an unconstrained moderator model and a fully constrained invariance model. The results of this multigroup analysis could not substantiate a significant difference between models ($\Delta df = 48$, $\Delta \chi^2 = 61.977$, $p = .085$). Hence, the invariance model could best fit the data (Figure 4) – suggesting the construct relations not to be moderated by the learners' gender. Rather the magnitude and directions of relations among constructs turned out to be equal either for females and males.

Figure 2. Structural equation modeling results for the relations of L2 English (L2E) and L1 German (L1G) competence and self-concept (SC) variables with the L2 extracurricular contact (L2CON) variable (R^2 = squared multiple regression coefficients). Solid lines represent significant ($p \leq .05$), dashed lines nonsignificant path coefficients.

Figure 3. Structural equation modeling results for the relations of the L2 English competence, self-concept (SCL2E), L2 narrative competence belief (PONC) and anxiety (WEOS) variables with the L2 extracurricular contact (L2CON) variable (R^2 = squared multiple regression coefficients). Only significant standardized beta-weights ($p \leq .05$) are reported.

Figure 4. Structural equation modeling results for the relations of diverse task-specific L2 English competence, L2 English self-concept (SCL2E), L2 narrative competence belief (PONC) and anxiety (WEOS) variables with the L2 extracurricular contact (L2CON) variable (R^2 = squared multiple regression coefficient). Only significant standardized beta-weights ($p \leq .05$) are reported.

Within this modeling perspective, the impact of teacher ratings of L2 speaking skills on the learners' extracurricular L2 activities was strongly mediated by their task-specific self-beliefs variables. Here again, the effect of the learners' anxiety concerning oral narrative classroom situations on their extracurricular L2 activities was essentially mediated by their perceptions of oral narrative competencies. Thus, the relations among constructs appeared to be typically determined by a twofold mediation process operating on the level of task-specific self-beliefs.

Additional Analyses of Gender Differences

Finally, for unraveling the potential effect of learners' gender beyond correlational results, a 3×2 analysis of variance (ANOVA) was run with the task-specific self-beliefs and gender as independent factor variables and the extracurricular L2 contact as dependent variable. Both the perceptions of oral narrative competencies and the anxiety concerning oral narrative classroom situations were factorized using their empirical tertiles, thus, leading to the identification of subgroups with low, average, and high self-beliefs. As the results could demonstrate, with regard to the L2 contact variable there were no gender differences between self-belief groups. Neither a significant main effect of the gender nor of the self-belief variables could be found. The same applied to relevant interaction effects (Table 7).

**Table 7. Effects of task-specific self-beliefs and gender on L2 extracurricular contact:
Results of two-way analyses of variance**

Extracurricular L2 Contact				
Factor Variables	df	F	p	η^2
Gender	1,255	0.996	.319	.004
Anxiety Concerning Oral Narrative Classroom Situations	2,255	2.044	.132	.016
Gender $\times$ Anxiety	2,255	0.068	.935	.001
Gender	1,255	1.871	.173	.007
Self-Perceptions of Oral Narrative Competence	2,255	1.812	.166	.014
Gender $\times$ Self-Perceptions	2,255	1.586	.207	.013

Note. df = degree of freedom, F = F-value, p = probability, η^2 = partial eta squared (effect size)

Likewise, post hoc multiple comparisons using the Scheffé test did not reveal any significant result. Furthermore, though in the subgroup with low self-perceptions of oral narrative competencies the females apparently reported a lesser frequency of extracurricular L2 activities (Figure 5), this difference did not meet the alpha-adjusted level of probability ($p \leq .017$) and failed to reach statistical significance. Hence, the hypothesized internal distress effect in the female group with lowered self-beliefs could not be supported.

Figure 5. Differences in the L2 extracurricular contact variable dependent on gender and task-specific self-beliefs.

CONCLUSION

With regard to L2 learners’ preferences in using extracurricular language sources, the results of the present study widely confirm, first of all, relevant findings from current EFL

research (Barbee, 2013; Csizér & Kormos, 2008a). In the secondary school sample under consideration the ninth-graders prevalently reported to be exposed to indirect types of language activities – in particular, concerning their everyday contact with modern mass and internet media. Only in the case of mailing or chatting, which appeared to take a moderate frequency of usage, they may occasionally experience interactive situations – and, thus, are sufficiently stipulated to produce explicit language output (Swain, 1985). However, these results cannot clarify at all the meaning of the L2 learners' contact preferences with respect to their actual language acquisition. This issue could be appropriately investigated only by means of longitudinal research designs. Furthermore, as a limitation of the results, the present study has dealt with several direct and indirect contact types, which do not consider the learners' extracurricular language activities in the most differentiated and exhaustive way. Following the conceptual features of relevant studies, future analyses should extend the sources of L2 contact outside school – e.g., by adding the learners' exposure to music media or video games (Barbee, 2013; Csizér & Kormos, 2008a; Sundqvist, 2009b; Sylén & Sundqvist, 2012). Correspondingly, in order to gain most differentiated and valid results future research should also broaden its methodological access to the field and more thoroughly consider alternate measurements to assess the learners' contact habits and preferences over time (Sundqvist, 2009b; Sylén, 2006; Sylén & Sundqvist, 2012).

Another essential issue on the learners' extracurricular language activities concerns the role of gender. As the present findings could demonstrate, females and males significantly differed only in the use of print media and the visit of websites. This particular finding is in line with research results reported elsewhere (Sundqvist, 2009b) and might indicate a gender stereotyping effect in reading and using internet sources, as well (Bimber, 2000; Schmenk, 2004). Therefore, this particular finding deserves further attention in future research efforts. Accordingly, relevant analyses have to expand their conceptual framework beyond the scope of EFL context – e.g., with respect to relevant educational factors which may contribute to originate and maintain gender-stereotyping effects on the formation of the learners' domain- or task-specific self-beliefs (Andre, Whigham, Hendrickson & Chambers, 1999; Meece, Glienke & Askew, 2009; Retelsdorf, Schwartz & Asbrock, 2015; Worrall & Tsarna, 1987).

As an important result of the present study, the relations of competence and self-belief constructs with the extracurricular L2 contact could be demonstrated to be subject-specific in nature. Thus, the learners' language activities outside school did not reflect a general, but rather a valid foreign language construct. That is, measures of learners' language contact outside school may not seriously be confounded with an overall interest in literature or media use. As this issue has not yet been analyzed, this finding may contribute to fill this empirical gap.

Furthermore, for the first time multivariate analyses of L2 construct relations were used to clarify the learners' competencies and self-beliefs in the area of oral narrative competencies. They could substantiate the predictive role of task-specific competence beliefs and anxiety responses in explaining interindividually existing differences in the learners' extracurricular language activities. In particular, they could show sequentially operating mediator effects of the task-specific self-belief variables. These mediator effects totally suspended any direct effects from the learners' L2 skills to their L2 contact. The same applied to the overall L2 self-concept variable – indicating the explanative superiority of task-specific measurements. With respect to the area of oral narrative competencies, the individual expectancy or anticipation of personal threat could claim the most critical role. Experiencing task-

specific worry and apprehension lowers related competence beliefs, which then restrict the frequency of extracurricular language activities. Here again, these results may contribute to refine and to expand current EFL research concerning the role of motivational variables (Csizér & Kormos, 2008b; Khodaday & Khajavy, 2013; Peng & Woodrow, 2010; Piniel & Csizér, 2013; Yashima, Zenuk-Nishide & Shimizu, 2004) – as they vitally refer to the task-specific measuring of self-belief constructs and, moreover, point out the decisive role of cognitive-motivational processes. It is not the learners' competence or proficiency level per se but rather their subjective perception of competence and apprehension which will affect their extracurricular language activities. However, further research has to replicate these findings with regard to other task-specific L2 areas – e.g., listening, pronunciation, reading, spelling, or composition. With that proviso, multivariate research efforts in the field should gain more precise access to relevant construct re-lations by more strongly analyzing construct relations on a task-specific level and considering potentially working mediator effects among constructs. That way, the complexities of construct relations should be incrementally unraveled and thus, step by step, the framework of L2 learners' motivational orientations or self-beliefs, respectively, could be conceptually and empirically optimized.

Apart from this general research perspective, the analysis of L2 learners' extracurricular language activities should certainly regard both their role as a dependent and as an independent variable. As the present study has explicitly focused the competence and self-beliefs as determinants of L2 learners' language contact outside school, it is hardly able to warrant a plain insight into construct relations under consideration. Therefore, future research in the field should best take all directions of construct relations into account. Furthermore, as the results of the present study are derived from cross-sectional data only, they do not allow for inferring any causal interpretation – rather they reveal the empirical testing of a conceptually decided *a priori* perspective of construct relations. Instead sound analyses concerning the causal ordering of relations among competence, self-belief and L2 contact variables can only be achieved by means of prospective longitudinal studies (Green, Nelson, Martin & Marsh, 2006; Marsh & Martin, 2011; Marsh & O'Mara, 2008b). These studies should, moreover, gradually integrate relevant other motivational, attitudinal and behavioral constructs (Csizér & Kormos, 2008b; Illes & Csizér, 2010; Gardner, Tremblay & Masgoret, 1997; Pae, 2008). Only results from longitudinal research will lead to a deeper understanding of developmental pathways explaining the relations among L2 learners' competencies, self-beliefs, and extracurricular language activities.

And finally, the results of the present study could not find any overall gender differences in the L2 contact variable. Accordingly, a moderator effect of the learners' gender on the construct relations could not be demonstrated. Multiple comparisons in the subgroup with particularly lowered competence beliefs showed a difference unfavoring the females in the frequency of L2 contact, but this difference was not statistically significant. Contrary to theoretical assumptions (Figure 1) as well to previous research findings with regard to the learners' overall L2 self-concept (Faber, 2013), here the internal distress hypothesis explaining motivational gender effects was not supported (Pomerantz, Altermatt & Saxon, 2002). This discrepancy might be possibly ascribed to the different levels of construct specificity used in each study. Hence, further research should comprehensively analyze this issue by comparing diverse task-specific and overall subject- or domain-specific measures. Taken altogether, the learners' gender appeared not to play a crucial role in determining their extracurricular L2 activities.

However, a closer look to the separate L2 contact items draws a more informative picture. With respect to the reading of English print media and the visit of websites significant differences between females and males occurred though. As this particular finding is basically in line with research results reported elsewhere (Sundqvist, 2009b), it should be further clarified. Gender differences might at least in particular cases depend on the type of contact source and, thus, might reflect the learners' various levels of literacy or internet literacy– which might, in turn, come as a result of gender stereotyping experiences (Dholakia, Dholakia & Kshetri, 2004). In particular, the use of a refined measure of L2 contact sources might help future research efforts to scrutinize the relation between gender, self-beliefs and diverse extracurricular language activities in a more thorough manner.

Chapter 46

A LEARNER'S FOREIGN LANGUAGE SELF-CONCEPT AND ANXIETY ABOUT SPEAKING THE LANGUAGE

Reiko Yoshida*

University of South Australia, Adelaide, Australia

ABSTRACT

The present study examines how a learner who learns Japanese as a foreign language (FL) at an Australian university develops a positive FL self-concept to overcome her anxiety about speaking the FL during the transition period from secondary school to university and then to a Japanese study abroad. FL self-concepts are a newly developed research area in applied linguistics, in which individual differences of the FL learners have been increasingly focussed on as well as affective factors, such as learners' feelings associated with the FL learning and socio-contextual factors, such as their learning environments. FL self-concepts refer to learners' beliefs about themselves as FL learners including an evaluation of their competence in FL and feelings of self-worth related to the evaluation. FL self-concepts are closely associated with anxiety to speak the FL because learners' social or intellectual status may be threatened by making mistakes, which may provoke negative FL self-concepts. This anxiety may worsen during the transition to universities or the initial stages of study abroad due to the unfamiliarity of new learning environments. Developing positive FL self-concepts and overcoming anxiety is very important, especially in those periods of time, for learners to increase their skills in communicating in FLs. FL or second language (SL) self-concepts have been investigated in the areas of English as FL, Russian study abroad, and European languages, such as Spanish or Italian (Jackson 2008, Mercer 2011a, 2012a, 20012b, Pellegrino Aveni 2005). However, no studies have been carried out in Asian language learning contexts. Therefore, the present study researches a learner's self-concept of Japanese as a FL.

Data were collected longitudinally for two years with diary writing, classroom observation and interviews (face-to-face and by Skype). A case study approach was used to closely examine how a learner's self-concept changes with detailed, personal and contextualised data. This learner was focussed on because she participated in the study both during transitioning to university and during study abroad and data collected from

* Corresponding Author Email: reiko.yoshida@unisa.edu.au.

her were very detailed and informative. The learner hesitated to speak Japanese in the classroom at the beginning of the course due to the fear of making mistakes, which did not contribute to developing a positive FL self-concept. By preparing for the lessons more carefully according to her belief in the importance of practice, she became more confident and started speaking Japanese more often in class. Even after developing a positive FL self-concept in the classroom, she hesitated to speak Japanese outside of class in her study abroad. After developing her confidence in listening comprehension with frequent practice and having a critical experience, her FL self-concept in speaking became more positive. The present study found that the development of learners' FL self-concepts is not linear. Even after developing positive FL self-concepts in a particular learning environment, their self-concepts may become negative in a different learning context. The study also suggests that learners can develop positive FL self-concepts by making learning actions based on their beliefs about FL learning.

INTRODUCTION

The self has become recognised as an increasingly important factor in current second language acquisition (SLA) theory, which considers that learners are different individuals with their own beliefs about language learning (e.g., Barcelos 2011, Dörnyei 2009, Mercer 2011c). The nature of self-concept is complex and overlaps with other concepts, such as self-efficacy, self-belief and self-perceptions (Mercer 2011a, 2011b, 2011c). In the present study, 'self-concept' is defined as "a psychological construct that comprises a self-description judgement that includes an evaluation of competence and the feelings of self-worth associated with the judgement in question in a specific domain" (Pajares and Schunk 2005, 14).

As this study investigates a learner's foreign language (FL) self-concept, the specific domain here is understood to be the FL learning domain—or, more specifically, the domain of Japanese language learning as an FL. Self-concepts may be particularly crucial in the FL/second language (SL) learning domain, compared to the learning of other subjects, due to the close relationship between learners' self-concepts and self-expressions or identity issues, which are very frequently involved in language learning (Horwitz, Horwitz and Cope 1986, Mercer 2011c). FL learners' self-concepts refer to not only cognitive components of their self-beliefs about FL learning and evaluations of their FL abilities, but also affective components of how they feel about those evaluations (Mercer 2011c).

One affective factor that has been most frequently discussed in FL learning contexts is FL learning anxiety. Many learners experience anxiety when speaking target languages in classrooms due to their fear and embarrassment about making mistakes (Aida 1994, Bailey 1983, Gardner and MacIntyre 1993, Hewitt and Stephenson 2011, Horwitz, Horwitz and Cope 1986, Komiya Samimy and Tabuse 1992, Liu and Jackson 2008, Mak 2011, Trang 2012). FL learning anxiety is situation specific, differing from other types of anxiety, and is related to embarrassment and self-expression in the classroom (Horwitz, Horwitz and Cope 1986). While FL learners may desire to express themselves by speaking the target language in the classroom, they will nevertheless sometimes avoid using the language due to a lack of confidence (Yoshida 2009). These studies imply that learners with FL learning anxiety feel threatened to speak target languages in situations like classrooms. However, Pellegrino Aveni (2005), who researched learners in a study abroad context, states that anxiety does not provoke the threat, but that the threat to their self-perceptions as SL learners—which

potentially occurs by speaking the SL in front of other people—produces feelings of anxiety. According to Pellegrino Aveni, learners present themselves through their language use; however, when speaking a target language in front of other people, learners' ability to control their self-image is significantly impaired. She stated that learners need to feel validated: that others accept and appreciate their contributions in target languages; that they have social and psychological security in using the languages; and that their sense of social, linguistic, and intellectual status is being enhanced. Without these conditions, learners may feel anxious that their self is threatened, along with their status as intelligent and capable individuals.

Speaking target languages is very important for FL/SL learners to develop their speaking skills. The more positive learners' self-concepts as language learners become, the more participation of the learners in speaking the languages occur (Pellegrino Aveni 2005, Yoshida 2013b).

FL learners need to overcome their anxiety by developing positive self-concepts in order to increase their opportunities to speak the FL for the enhancement of their speaking skills. The transition from secondary school to university is a particularly psychologically stressful period, which in itself increases learners' anxiety, while learners' self-concepts are particularly affected by social environments, such as FL classrooms (Jackson 2008). Another situation in which learners' anxiety increases is a study abroad, especially the beginning of the study abroad due to the foreign environment that the learners have not experienced. Therefore, the present study examines how a Japanese language learner develops a positive FL self-concept¹ during the transition period to university and during the first stage of a Japanese study abroad. Because the studies about FL/SL self-concepts started in 2000s, there are not many studies besides Mercer (2011a, 2011c, 2012a, 2012b, 2014), Pellegrino Aveni (2005), and Jackson (2008).

These studies investigated self-concepts related to English and European languages, such as Spanish, Italian and Russian as SL/FL. More studies of self-concepts about a wider range of languages are necessary.

Japanese is an Asian language that is widely taught in the world, especially in English-speaking countries, such as Australia. However, FL self-concepts of learners of Asian languages have not been investigated in previous studies. Therefore, the FL self-concept of a Japanese language learner at an Australian university is explored in the present study. The research question of the study is as follows:

How does a Japanese language learner develop a positive FL self-concept and overcome anxiety to speak the language during a transition period from secondary school to university and the first stage of a Japanese study abroad?

To address the research question, the model of internal/external frames of references in FL self-concept formation (Marsh 1986, Mercer 2011c) and the theory related to self-presentation in SL (Pellegrino Aveni 2005) are used to discuss the factors that influence FL self-concept of the learner and her use of strategies to reduce anxiety to speak Japanese. These theories are introduced in the following sections.

¹ While study abroad can be an SL context, the learner's self-concept related to Japanese language learning is called FL self-concept in both an FL classroom context in Australia and a Japanese study abroad in the present study to avoid confusions.

INTERNAL/EXTERNAL FRAMES OF REFERENCES IN FL SELF-CONCEPT

By revising the model created by Marsh (1986), Mercer (2011b) developed a model of internal/external frames of references in FL self-concept formation. Mercer (2011b, 97) defined internal factors as ‘those that are centred primarily within the self’ and external factors as ‘those that stem primarily from outside the individual’. Internal factors consist of the following: 1) cross-domain comparisons (at the subject level, across FLs, across first languages and SLs, across skill domains, and across task domains); 2) belief systems (beliefs about language learning and attribution beliefs); and 3) affect. External factors are as follows: 1) social comparisons; 2) feedback from significant others and reflected appraisals; 3) perceived experiences of success and failure; 4) previous language learning/use experiences in formal/informal contexts; and 5) critical experiences.

Beliefs about language learning, which are pointed out as one of the internal factors, are different from one dimension of FL learners’ self-concepts—their beliefs about themselves as FL learners. In the present study, beliefs about language learning are defined as learners’ ideas about language learning (such as ‘practise is important for Japanese language learning’), while self-concepts are learners’ ideas about themselves as language learners (such as ‘I am good at reading, but not speaking, Japanese’). Beliefs about language learning is a factor that gives a strong influence on learners’ FL self-conceptss (Mercer 2011c, Yoshida 2013b).

LEARNERS’ SELF-PRESENTATION IN SL/FL

The ways learners present themselves in an SL is related to how they perceive themselves as SL learners (Pellegrino Aveni, 2005). Pellegrino Aveni (2005) has examined how SL learners present themselves in an SL through studying interactions with native speakers and how these speakers construct ‘selves’ in their in-country studies. According to her, self-concept—which is ‘a system of knowledge and perceptions held by the individual about the self’ through the recording of events and these recollections—gives the individual ‘a sense of security’ related to their strengths and weaknesses and a sense of ‘predictability about the self’s future capabilities’ (Pellegrino Aveni, 11). In Pellegrino Aveni’s theory, two types of factors affect learners’ self-construction:

- Social-environmental cues, including the learners’ personal characteristics, such as age, gender, physical appearance and behaviour
- Learner-internal cues, including the learners’ attitudes and beliefs about themselves, others and the FL; their own and foreign cultures; and the language-learning process.

According to Pellegrino Aveni (2005), learners use two different strategies to reduce their anxiety in study-abroad situations: they either keep using the SL and attempt to eliminate threatening elements (fight) or they reduce their use of SL to protect themselves (flight). There are a few different fight strategies. First, learners can use self-talk to coach and encourage themselves that they can perform adequately in the SL. This strategy is similar to affective strategies (Green and Oxford 1995, Oxford 1990), such as self-encouragement or

discussing one's feelings with someone else (or with themselves). Second, they prepare themselves for SL interactions so that they can improve their success and thus ensure a greater sense of security in speaking the SL (interaction preparation). Third, they may choose favourite SL environments or interlocutors with whom they feel comfortable. Learners also use flight strategies, by physically or verbally avoiding speaking with other people, speaking at a very low volume or masking their voice, or decreasing the length or the content of the message they want to convey.

The internal/external frames of reference indicated the factors that influenced learners' self-concepts in FL contexts, while the theory of self-presentation explained how learners' self-presentations were affected by different factors related to their self-concepts in a study-abroad context. However, both theories are applicable for both FL classroom contexts in transition periods from secondary schools to universities and the initial stages of study-abroad contexts because in these new learning environments learners' self-concepts are fragile and significantly affected by internal and external factors.

Pellegrino Aveni (2005) explains that learners' anxiety to speak SL comes from a threat to their SL self-concepts because they need to protect their self-images as mature and intellectual individuals. A learner also envisions his/her future self-image as an SL/FL learner according to his/her desires, which is called the ideal L2 self in Dörnyei's (2009) L2 self-motivational system. When learners consider that their real L2 selves (their current FL/SL self-concepts) are far from their ideal L2 selves; they may hesitate to speak the language from a fear of the threat to their FL/SL self-concepts. Dörnyei's theory of the L2 self-motivational system is explained in the following section.

L2 SELF MOTIVATIONAL SYSTEM

Dörnyei (2009) states that L2 selves act as learners' future self-guide to developing their proficiencies and achieving goals in their L2 learning processes. According to him, there are two types of L2 selves: the ideal L2 self and the ought-to L2 self. The ideal L2 self is 'the representation of the attributes that one would ideally like to possess', and the ought-to L2 self is 'the representation of attributes that one believes one ought to possess' (Dörnyei 2009, 13). The ideal L2 self represents the learner's own hopes or aspirations, while the ought-to L2 self represents someone else's sense of duties or obligations. The ideal L2 self is 'promotion' focussed, while the ought-to L2 self is 'prevention' focussed (Higgins 1998, 15). For example, a learner may desire to become a fluent L2 speaker because he/she wants to communicate with native speakers confidently and effectively (ideal L2 self). The other learner may desire to become a fluent L2 speaker to avoid receiving a bad grade or because his/her teacher says that being fluent in the language is important (ought-to L2 self). Dörnyei (2009) argues that the ought-to L2 self is more extrinsic and less internalised and that the ideal L2 self is more internalised by being integrated into the learner's current self-structure. The ideal L2 self is a powerful motivator of L2 learning due to the learners' desire to reduce the discrepancies between their real L2 selves, which reflect their current L2 proficiency, and their ideal L2 selves (Dörnyei 2009).

Learners' ideal L2 selves may be associated with their beliefs about language learning, which significantly influence on learners' FL self-concepts because it is considered that

learners usually develop their ideal L2 selves based on what they think is crucial for language learning. For example, if a learner believes that writing skills are important for language learning, he/she would develop an ideal L2 self who is a competent and skilful writer in the language. A gap between a learner's ideal and real L2 selves seems to be a motivator to reduce the gap. When the learner decreases the gap, his/her SL/FL self-concepts may become more positive. Therefore, the relationship among beliefs about language learning, ideal L2 self and SL/FL self-concept need to be investigated to examine how a learner develops a positive FL self-concept.

METHODOLOGY

Participant

The present study is a case study with a single participant, Sandra. A case study approach was used to closely examine how her self-concept changes with detailed, personal and contextualised data. Sandra was focussed on because she participated in the study both during transitioning to university and during study abroad, and data collected from her were very detailed and informative. Sandra enrolled for the second-year level Japanese course (one year) at an Australian university after completing a nine-month Japanese course at the Vocational Language Learning Centre (VLLC). She had a medical problem during high school and decided not to enter university straight away. Sandra had learnt Japanese for 10 years during primary and secondary school. She was a 25-year-old white Australian student majoring in international studies.

The university offered four Japanese language courses from first-year to the fourth-year level. The first-year level course is for students who have had no formal prior experience with learning Japanese. The second-year level course is geared towards students who have completed either a first-year level course at university or a Year 12 course at secondary school, or who have equivalent Japanese proficiency. Most of the classes that Sandra took at the VLLC were one-to-one tutorials with a Japanese tutor. The second-year level course at the university consisted of approximately 20 students in a class. Therefore, this was a very different learning environment for Sandra. The class met twice (two-hour lessons each) in 13 weeks in both first and second semesters. The lessons usually included introductions of new grammar and vocabulary with a few pair/group works.

After completing the second-year level course, Sandra stayed in Japan for nine months in the following year to learn Japanese at a university through an exchange program between the Australian and Japanese universities.

The first half of the present study (a transition period to university) was a part of a larger study on four students that investigated the relationship between the learners' FL self-concepts and beliefs about language learning. Sandra, who was one of the four volunteer students to participate in the study, was the only one who took the Japanese study abroad after the completion of the second-year level course.

Therefore, the current study focussed on her because the purpose of the study was to examine how a learner's FL self-concept changes in both a transition period to university and a study abroad.

Data Collection

Multiple instruments (diary entries, interviews and classroom observation) were used to elicit information about the learner's FL self-concept, beliefs about language learning and ideal L2 self.

The combination of interviews with journal or diary writing has been frequently adopted in recent studies of L2 learners' beliefs and self-concepts (Aragão 2011, Mercer 2011a, Navarro and Thornton 2011, Norton 2001, Peng 2011, Yang and Kim 2011, Yoshida 2013a, 2013b), as it allows researchers to ask further questions based on the diary entries and thereby better identify FL self-concepts, beliefs and L2 selves.

While there are many quantitative studies about learners' selves related to SL/FL, more longitudinal studies with a naturalistic approach and a qualitative analysis are necessary to examine the dynamic nature of learners' self-concepts (Lyons 2014, Sugita McEown, Noels and Chafee 2014).

Case study research, which can produce detailed and contextualised data on individuals, is particularly useful for self-concept studies, considering the dynamic and contextual nature of self-concepts (Mercer 2012b).

Therefore, the data in the present study were collected longitudinally (for two years); diary writing and interviews were employed to obtain detailed information about Sandra's FL self-concept, beliefs and ideal L2 self, including her changes with a particular focus on the first four months in the transition period and the study abroad.

The researcher, who was a course coordinator and a teacher of the course, asked for second-year volunteers to participate in the research. An outline of the proposed research was given to each participant, which was also explained orally by the researcher. Sandra was one of the four volunteers.

The participant signed a consent form, which stated that data collected would be used only for the research purpose and that participation or withdrawal would not affect her university study in any ways. The participant also received a questionnaire (see Appendix A) about her previous language learning experiences, her goals for taking the course and her beliefs about language learning, and she was asked to complete the questionnaire and bring it for her first interview.

The researcher enquired of the learner's goals because they are associated with the student's ideal L2 self. It was considered that the learner sets goals to achieve her ideal L2 self. The goals were considered as what the learner wants to achieve by the end of the course and in the future.

The questionnaire was used to find out how the learner's FL self-concept is related to her background, including her previous language learning experiences. Data were collected during the second-year level course at an Australian university and a Japanese study abroad (approximately two years), and the first semester of the course at an Australian university (approximately four months)² and the first stage of the Japanese study abroad (approximately four months)³ were particularly focussed on for the analysis. The schedule of the data collection is indicated in Tables 1 and 2.

² The first semester started at the beginning of March and finished in the middle of June (there was a 2-week break in the middle of the semester).

³ Sandra arrived in Japan in March before the course at the Japanese university started. The study focussed on the period from April to July.

Table 1. Schedule of data collection (Australia)

Date	Interview	Diary entry	Classroom observation notes
March	2	4	After each lesson
April	1	3	After each lesson
May		4	After each lesson
June	1	2	After each lesson
Total	4	13	26

Table 2. Schedule of data collection (Japan)

Date	Interview	Diary entry
March	1*	2
April	1	4
May	1	3
June		3
July	1	
Total	4	12

*The interview was conducted before Sandra's departure to Japan.

Diary Writing

Diary writing was used to find out about Sandra's FL self-concept, ideal L2 self and beliefs about language learning.

Previous studies indicate that diary writing is effective for investigating SL/FL learners' learning experiences, including their anxiety about learning a language and their frustration about teaching methods (e.g., Bailey 1983, 1996). Dairies are useful for eliciting aspects of language learning, such as FL self-concepts, beliefs and L2 selves, which are usually hidden or not accessible to an external observer (Bailey and Ochsner 1983). Sandra was instructed to submit a diary entry every week as an e-mail attachment except when she was sick or extremely busy. She submitted 13 diary entries in the second-year level course at an Australian university and 12 diary entries during her study abroad⁴ (see Tables 1 and 2). The length of the diaries varied according to the time spent writing, with the longest entry being three A4 pages and the shortest, half an A4 page. The average length was one A4 page. She was asked to write about her Japanese language learning experiences in English at least once every week, and instructed to write about her learning activities in and outside of the class and what she noticed or felt during her activities both in and outside of class. In her early entries, Sandra tended to only report on her actions. However, because information about her FL self-concept, beliefs about language learning and her L2 self behind those actions was also needed, written instructions for the diary writing were provided to her so as to elicit insights

⁴ The first 15 weeks in the transition period to university and the first 18 weeks in the study abroad were particularly focussed on in the current study.

about her own learning experiences (see Appendix B). Before Sandra's departure to Japan for the study abroad, additional instructions for diary writing in Japan were given (see Appendix C). The instructions suggested that she writes how she felt when she noticed new items, difficulties, problems or achievements. The researcher read the diaries prior to conducting the interviews.

Interviews

Semi-structured interviews were undertaken four times during the first semester in the Japanese course at the Australian university in face-to-face situations and four times during the first period of the Japanese study abroad by Skype⁵ to examine how Sandra's FL self-concept changes in relation to her beliefs about language learning and ideal L2 self (see Tables 1 and 2). The interviews varied from one hour to three hours, depending on the questions and the participants' responses. The interviews were conducted in English, which was the first language of the student. During the first interview, the researcher asked Sandra questions about topics, such as her previous experience of language learning, her reason for learning Japanese at university and her expectations about her Japanese skills or abilities upon completing the course. These questions were based on Sandra's questionnaire responses. In subsequent interviews, the questions were related to Sandra's diary entries and classroom behaviours. Although the researcher prepared some questions to ask the students, the structures of the questions could be altered and further questions asked based on Sandra's responses. This flexible structure was effective in allowing for appropriate questions to identify Sandra's FL self-concept, beliefs about language learning and ideal L2 self. Whenever Sandra identified actions (such as regularly preparing for lessons) without mentioning her thoughts about them, further relevant questions were asked during the interviews. All the interviews were audio recorded by the researcher and transcribed by a native or near-native English speaker to analyse Sandra's self-concept, beliefs and ideal L2 self in the data.

The transcripts were checked against the audio recordings, with the Japanese expressions used by the interviewer and Sandra in the interviews corrected as required.

Because the researcher was Sandra's teacher in the second-year level course at the Australian university, there was a possibility that this relationship might affect Sandra's reports in her diary entries and interviews in the first half of the current study.

At the beginning of the data collection, the researcher told Sandra that her statements and responses would never influence their relationship or her grade/status in the course and the university in any way, and asked her for honest reports.

In the last interview in the semester, the researcher asked Sandra whether her awareness of their relationship had influenced her statements or responses. According to Sandra, she was not the type of a person who changes reports depending on their relationship and stated honest opinions and feelings in the diary entries and interviews. Therefore, the influence of their relationship seemed to be limited at least at a conscious level.

⁵ One face-to-face interview was carried out before Sandra's departure to Japan in March.

Classroom Observation Notes

Because the researcher was Sandra's teacher at the Australian university, she took notes related to Sandra's classroom behaviours, including her use of Japanese after each lesson in the first semester for supplementary data to the diary entries and interviews. The purpose of the use of this method was to examine how Sandra's FL self-concept, beliefs about language learning, and ideal L2 self influence her classroom actions to back up the reliability of those factors that were identified in the data of diary entries and interviews.

Data Analysis

The data were analysed qualitatively with content analysis for in-depth review of Sandra's FL self-concept, beliefs about language learning, and ideal L2 self. Content analysis is useful for identifying important factors in texts (such as learners' self-reports) and for evaluating the relationship between them by using coding, mapping or tabulation (Krippendorff 2004). This approach has been used in other recent studies of beliefs (e.g., Navarro and Thornton 2011, Peng 2011). Huckin (2008) explains that there are two types of content analyses: conceptual analysis, where a concept is chosen for examination and coded, and then the number of times it occurs within the text is recorded; and relational analysis, which builds on conceptual analysis by also examining the relationship between concepts in texts. Relational analysis was used in the present study to scrutinise how the concepts under study, FL self-concept, beliefs about language learning and ideal L2 self, were related to each other.

The researcher identified the entries that indicated Sandra's FL self-concept, ideal L2 self and beliefs about language learning (in her diaries and the interview transcripts) and coded them, in order to analyse the relationship between these factors. FL self-concepts referred to comments about self-evaluation of current FL abilities including affects, such as fears or feeling of achievements (such as 'I can speak Japanese in the class without hesitating'). Beliefs included any ideas about Japanese language learning (such as 'practice is important for language learning').

Ideal L2 self was found in the Sandra's comments about her beliefs and goals. For example, when the learner believed in the importance of practice and set a goal of developing Japanese language skills, her ideal L2 self was considered to be a competent person in the use of Japanese as a result of constant practice. The learner's ideal L2 self and ought-to L2 self were not mutually exclusive. Following Dörnyei's (2009) argument that the ideal L2 self is more internalised and connected with intrinsic factors (e.g., learner's own interests or values), while the L2 ought-to self is less internalised and more associated with extrinsic factors (e.g., values of a teacher or classmate); Sandra's ideal L2 self was categorised through associating her comments with intrinsic or extrinsic factors. Whether L2 self is more promotion-focussed or prevention-focussed (Higgins 1998) was also considered in the categorisation. The researcher mapped the change of Sandra's FL self-concept and added her beliefs about language learning and ideal L2 self in related sections. The researcher's notes about Sandra's classroom behaviour from the observation of the classroom at the Australian university were also added. During the analysis, the data of diary entries and interviews were repeatedly reviewed, and the analysis was revised when necessary.

RESULTS

This section discusses how Sandra's FL self-concept changed more positively in the transition period to university and during the first period of her Japanese study abroad by citing excerpts of her diary entries and interview transcripts. Because questions in the interviews were based on Sandra's reports in the diary entries, the interview transcripts usually included more detailed information about her FL self-concepts. Therefore, most of the excerpts are from the interview data.

Change of Sandra's FL Self-Concept in a Classroom

Sandra found speaking Japanese in the class difficult at the beginning of the course at the Australian university:

Excerpt 1

I don't like to speak Japanese in the class because I don't want to look silly when I make mistakes. But this idea is stupid. I know I can learn from making mistakes and want to practice speaking in the class, but it is hard at the moment (interview, week 1, March).

The comment of Sandra indicates her hesitation of speaking Japanese from the fear of making mistakes. In transition periods to universities, FL self-concepts are significantly influenced by social environments like FL classrooms (Jackson 2008). In the new classroom environment of the university, Sandra seemed to be afraid that her FL utterances might not be accepted or appreciated by her teacher and classmates, and that her intellectual status might be threatened by making mistakes (cf. Pellegrino Aveni 2005). Sandra's anxiety about speaking Japanese in the class seemed to be related to the threat to her FL self-concept by making mistakes. According to the classroom observation notes, Sandra did not speak Japanese spontaneously to answer the teacher's questions to the class at the beginning of the course. Reduction of speaking target languages is a flight strategy to avoid the situations that potentially threaten learners' SL/FL self-concepts (Pellegrino Aveni 2005). However, her comment also shows her desire to speak Japanese to practise the language, as Yoshida (2009) found, and her belief that she can learn from making mistakes.

Her desire of speaking Japanese may be related to her belief about language learning. Sandra had a strong belief in the importance of practice in building her confidence and developing her Japanese skills:

Excerpt 2

Unless I practice it, it's just thinking, and I am pretty much a practical learner — I have to learn by talking, by doing, by feeling and experiencing, and that way I make the connections to, to what means what; and for me it's extremely important (interview, week 1, March).

Sandra also mentioned 'to me, confidence comes from practicing more and knowing more' (interview, week 5, March). She commented in her first interview that her goal was developing whole skills in Japanese including speaking.

Therefore, Sandra's ideal L2 self appeared to be 'a person who is competent in all skills in Japanese due to continuous and frequent practice of the language', which was based on her belief in the importance of practice. Her belief in the importance of practice implies Dweck's (2006: 23-25) 'growth' mindset, in which learners believe that they can develop their basic abilities through effort, compared to the 'fixed' mindset, in which learners believe that their qualities are innate and fixed. Sandra believed that she would be able to improve her skills through practice. Sandra's desire to be competent in all skills by practicing the language frequently could be based on her ought-to L2 self avoiding a bad grade. However, her motivation to learn the language was intrinsic:

Excerpt 3

I love learning. I have a passion to learn a language. A better grade should be nice, but I don't learn for the sake of the grade. I learn because I want to (interview, week 1, March).

It seems that Sandra desired to become competent in all skills as a result of her constant practice that was shaped by her love for learning the language. Therefore, her desire is considered to be more intrinsic rather than extrinsic or institutional. Sandra also seemed to be more promotion-focused (desired to improve language skills from her love of learning) than prevention-focused (desired to develop the skills to avoid a bad grade).

However, Sandra's ideal L2 self was far from her real L2 self at this stage. Although she wanted to present herself as a competent Japanese speaker in the class, she actually hesitated to speak Japanese from the threat to her FL self-concept involved in making mistakes. Due to this threat, Sandra could not practice speaking Japanese in the class, while she knew that the achievement of her ideal L2 self was not possible without practicing. Her avoidance of speaking Japanese in the class conflicted with her belief in the importance of practice. In this situation, Sandra could not construct a positive FL self-concept. She described herself as 'I am a perfectionist at heart and basically a shy person who does not always enjoy socialising' (interview, week 5, March). Gregersen and Horwitz (2002) pointed out the relationship between language learners' anxiety and perfectionism. Therefore, Sandra's high anxiety about making mistakes could be because of her perfectionist nature as well as the new learning environment.

These 'shy' and 'perfectionist' self-concepts, which had developed through the learners' past experiences of Japanese language learning, seemed to become more stable due to her experiences of not being able to speak more Japanese in her university classes.

According to Dörnyei (2009), a discrepancy between a learner's ideal and real L2 selves motivates him/her to reduce the discrepancy. To reduce the discrepancy, which frustrated Sandra, she started preparing for the lessons more carefully so that she would become more confident to speak Japanese in the classroom. These preparations increased her familiarity with classroom activities.

Sandra's preparations for lessons were equivalent with interaction preparation (preparations for interacting with other people in target languages), which is one of fight strategies in Pellegrino Aveni (2005).

Sandra prepared for lessons to interact with her teacher or classmates by speaking Japanese in the lessons. According to the researcher's observation notes in weeks 7 and 8,

Sandra became more relaxed, seemed to enjoy the lessons and started speaking Japanese more often in the class.

As the course went on, Sandra became more familiar with her classmates and found that they also made mistakes:

Excerpt 4

Now I enjoy speaking Japanese with my classmates. I found I was not the only one who makes mistakes. They make similar mistakes (interview, week 7, May).

According to Pellegrino Aveni (2005), when learners find familiarity and commonality with their interlocutors, their social and psychological security in speaking an SL increases. The increase of the familiarity with her classmates contributed to increase Sandra's sense of security to speak Japanese in the class. Sandra's comment in Excerpt 4 suggests that she made social comparisons—comparisons between her own competence in the FL and her classmates' competencies.

Learners' social comparisons are especially evident in the transition period to university, where changes in external frames of reference affect the formation of self-concepts (Mercer 2011b). Sandra was afraid that her classmates' Japanese competencies might be much higher than hers.

By finding that their competencies were not very different from hers, Sandra increased her sense of security and confidence to speak Japanese. After participating in the class more actively by speaking Japanese, Sandra finally overcame her anxiety to speak Japanese and make mistakes:

Excerpt 5

I can cope with making mistakes now, which I think is a real improvement for me! I feel more confident when I speak up (in Japanese) (diary, week 9, May).

Sandra's real L2 self became closer to her ideal L2 self because she became able to speak Japanese confidently in the class. There was no conflict between her belief in the importance of practice and her learning action, which is practicing speaking without being scared of making mistakes in the class. Sandra's FL self-concept became more positive compared to the beginning of the course:

Excerpt 6

I can speak Japanese in the class without hesitating. I am more confident in my Japanese and feel I am a totally different person, compared to the beginning of the course (interview, week 14, June).

Because Sandra became confident in speaking Japanese and enjoyed learning the language more, she decided to apply for the university's exchange program with a Japanese university, according to her other belief in the importance of exposure:

Excerpt 7

You need to be absorbed in the language every day. That is the best way to learn a foreign language (interview, week 14, June).

Sandra was accepted by the Japanese university and decided to study in Japan for nine months in the following year.

Change of Sandra's FL Self-Concept during Study Abroad

Sandra's main purpose of the study abroad was to gain more opportunities to practice speaking Japanese not only in the class, but also outside of the classroom as well as being exposed to Japanese in her daily life:

Excerpt 8

I believe that I would have more opportunities to speak Japanese with Japanese people or other international students outside of the class, which is lacking here in Australia. Yeah, exposure and practice are definitely keys to develop language skills (interview before the departure to Japan, March).

Experiencing more opportunities of exposure to Japanese and speaking Japanese both in and outside of the class through the study abroad seemed to be very important to achieve Sandra's ideal L2 self (a person who is competent in all skills in Japanese). She took Japanese lessons at the Japanese university with the other international students and commented that she did not hesitate to speak Japanese in the lessons.

However, Sandra found difficulty with speaking Japanese outside of the class. She lived in a dormitory of the university with many other international students and a few Japanese residential assistants. Sandra commented that she hesitated to speak Japanese with the other international students, especially those whose Japanese proficiencies were very good:

Excerpt 9

I mean in I House (the dormitory), there are Korean and Chinese people here who speak really good Japanese, and occasionally I'll talk to them if they happen to be out, but in general — I mean, I suppose because I don't — because I'm not very confident in my Japanese skills, I don't talk to them (interview, April).

Sandra's comment again shows social comparison, which is a comparison of Japanese speaking skills between herself and the other international students. As social comparison is often found in transition periods to new learning environments (Mercer 2011b), this occurred again at the beginning of the study abroad. Sandra avoided speaking Japanese with the other international students whose speaking abilities in Japanese were very good due to a threat to her intellectual status by making mistakes or showing poor speaking skills in front of those students. This is again a flight strategy in Pellegrino Aveni (2005). At this stage, her ideal and real L2 selves were distant at least in the contexts of outside of the Japanese class since Sandra could not present herself as a competent Japanese speaker. Her avoidance of speaking Japanese with the other students did not support her belief in the importance of practice. The gap between Sandra's ideal and real L2 selves did not contribute to the development of her positive FL self-concept.

Sandra missed opportunities to practice speaking Japanese, which surfaced her self-concept as a person who is shy and not sociable again:

Excerpt 10

Inherently, I am very shy as well, so if I don't really know what they're (the other international students and Japanese people) talking about, or how, or how I can respond to it, I tend to not talk to them at all (interview, April).

Sandra's self-concept as a person who is shy and not very sociable seemed to be a core self-concept (Mercer 2011a), which is more stable and not dynamic. While Sandra's self-concept as a shy person did not change, she achieved a positive FL self-concept as a confident Japanese speaker in the class.

However, because she did not have a sense of security to speak Japanese due to a threat to her intellectual status outside of the class, this self-concept as a shy and unsociable person appeared as an obstacle to speak Japanese with other people.

While Sandra found practicing speaking Japanese outside of the class difficult, she practiced listening to Japanese intensively in her daily life by watching TV and Japanese animations, and listening to Japanese people talking with each other on the streets or trains, based on her belief in the importance of practice:

Excerpt 11

You need to practice a lot, and it is easy here. I always listen to TV and people talking (in Japanese). Constantly listening to Japanese now. I can pick up what people are saying and understanding what they say a lot better than some of the other people around me. But at the same time it's — I still find it hard to talk back (interview, May).

Sandra practiced listening according to her belief in the importance of practice that was based on her growth mindset. As a result, her listening skills improved. Sandra's self-concept in the domain of listening comprehension became more positive. Learners sometimes rely on their self-concepts in a particular domain to evaluate their whole FL self-concepts to protect them (Mercer 2011c). However, Sandra's FL self-concept did not really become positive even with a positive self-concept in the listening comprehension domain because her ideal L2 self was a competent FL learner in the whole skills as a result of constant practices. Without practicing speaking Japanese in more authentic situations than the classroom, Sandra's ideal L2 self could not be achieved. There was a gap between Sandra's ideal and real L2 selves.

Later in her study abroad, Sandra went to a hot spring with a Japanese residential assistant and a few English-speaking international students on a weekend and found that she had better Japanese speaking skills than those international students who were studying in a higher-level Japanese class than hers:

Excerpt 12

One of the (Japanese) ladies was like, was telling me how her grandson I think has a dog like that and she looks after it...it was just nice to be able to talk to her and say, "Oh, is that so? That's so cute. I've got a dog at home myself," and that sort of thing. I understood all she had said...they (the other international students) didn't talk to the lady that sat next to us and they found it hard to — they spent most of the time talking in English. They didn't really spend a lot of time trying to talk in Japanese at all...I felt like I spent more time talking to her than I did my friends (interview, July).

This experience seemed to be an essential factor to change Sandra's self-concept related to speaking Japanese from negative to positive. Learners' perceived experience of a success is one of the external factors that influences their FL self-concept (Mercer 2011b). This experience is also a crucial experience that is the other external factor to develop FL self-concepts in Mercer (2011b). The improvement of her competence in listening comprehension may have increased opportunities to speak Japanese, as Sandra mentioned that she could understand what the woman had said completely. Sandra's comment indicates a social comparison between herself and the international students who belonged to the upper-level Japanese class. Sandra perceived that she was a more competent speaker in Japanese than the other students. This perception contributed to reducing the gap between her ideal and real L2 selves and developing a more positive FL self-concept, which led her to feel a sense of security to speak Japanese outside of the classroom.

Sandra mentioned this experience as her 'confidence booster' (interview, July) and gradually became more positive about her Japanese speaking skills. Sandra's more positive self-concepts about her Japanese speaking skills also seemed to change her learning actions. She started creating more opportunities to speak Japanese:

Excerpt 13

As times going on doing classes and that I am trying to speak more Japanese with these people (international students and Japanese residential assistants who were staying in the same dormitory), even if they respond to me in English like if I know to say it in Japanese, I will say it in Japanese (interview, July).

For Caucasian students who are native English speakers, it is not easy to find opportunities to speak Japanese in a Japanese study abroad because many other international students understand English, and Japanese people, especially Japanese students, often prefer to speak English for their English practice. Therefore, it is not easy to keep talking in Japanese for native English speaker students, unless their Japanese is very good. However, Sandra kept using this strategy to increase the chances of practicing speaking Japanese. This behaviour is a fight strategy in Pellegrino Aaveni (2005) and very different from Sandra's previous behaviour of avoidance of speaking Japanese with the other international students, which is a flight strategy. Sandra's learning action, which is practicing speaking Japanese actively, became consistent with her belief in the importance of practice, which seemed to help the development of her positive FL self-concept.

Sandra reflected on her study abroad in her interview early in the following year:

Excerpt 14

I definitely think I had a little bit in the beginning because I know I put a wall between myself and anyone who could speak Japanese better than I could...by the second semester I don't think it was there at all...I sort of just embraced it and at the same time I sort of — I didn't use the marks I was getting from them as the marker of me picking up the language. I was using my comprehension and the fact that I understand what people were saying and I could understand what was being written...as long as you're — as long as I'm progressing at the pace I want to progress at and as long as I can see improvement,

I don't care anymore. I just want to keep learning more (interview, February in the following year)⁶.

At the beginning of the course, Sandra compared her Japanese skills with the other learners whose skills were better than hers, which reduced her sense of security to speak Japanese outside of the class. However, after she became more confident in her Japanese speaking skills, she started focussing on her own progress. Mercer (2011b) categorised learners' sense of progress under 'affect', which is one of the internal frame of references to influence the learners' self-concepts. According to Mercer (2011b), learners' positive affective responses to their sense of progress effect on their self-concepts. Learners who maintain a sense of security based on their internal cue tend to produce more SL and take risks more often, compared to those who rely more on social-environmental cues (Pellegrino Aveni 2005). Sandra seemed to develop more positive self-concept and become more active in her learning by focussing on internal factors, and her sense of security based on her own progress appeared to make her create more opportunities to speak Japanese.

DISCUSSION

This section discusses important factors to change the learner's FL self-concept to more positive. Sandra's FL self-concept was affected by a fear of making mistakes, which could threaten her social and intellectual status as an FL learner in the new learning environments, in line with Pellegrino Aveni's (2009) finding. Due to this fear, Sandra hesitated to speak Japanese in the FL classroom or outside of the classroom in the Japanese study abroad context. Although she wanted to practice speaking Japanese based on her belief in the importance of practice to achieve her ideal L2 self (a competent FL learner in all skills, including speaking, as a result of constant practice), she could not do so. Sandra's real L2 self was far from her ideal L2 self, which did not contribute to developing a more positive FL self-concept. Her learning action of avoidance of speaking Japanese conflicted with her belief in the importance of practice.

To reduce this discrepancy between the ideal and real L2 selves, Sandra started preparing for the lessons more carefully in Australia and practicing listening to Japanese more intensively in Japan, according to her belief in the importance of practice. Sandra's belief in the importance of practice is related to her growth mindset. The growth mindset is also associated with an attribution belief that one's success is attributed to one's effort. Developing a more positive self-concept may be easier for learners who believe in the value of effort within a growth mindset, as opposed to those who have a fixed mindset.

By making learning actions based on her belief, Sandra developed her Japanese knowledge and skills and became more confident, which contributed to increase her sense of security to speak Japanese. The increase of familiarity with what she was learning and the learning environments, and her classmates or the other international students also supported enhancing her sense of security. Furthermore, Sandra realised that her Japanese ability was

⁶ Data collection was continued in the following year of Sandra's study abroad to examine how her FL self-concept changed in a Japanese course at the Australian university that she took after completing her study abroad, which is beyond the scope of the present study.

similar to or even better than those of the other students. Social comparison is one of external factors that influences learners' FL self-concepts (Mercer 2011b). While at the beginning of the courses, the social comparison gave a negative influence on Sandra's FL self-concept when she perceived that her ability was lower than the other students, later in the courses, the comparison influenced her FL self-concept positively by realising that her Japanese competence was similar to or better than those of the other learners.

Once Sandra became more confident, she started focussing on her own progress, which is one of the internal factors to influence FL self-concepts (Mercer 2011b), rather than comparing her competence with those of the other students. According to Mercer (2011b, 22), an important affective state for a learner's positive response to a particular FL is 'a sense of progress', which also increases motivation to learn FLs. Pellegrino Aveni stated that when learners establish their sense of security in speaking the SL from within, others' behaviour has less effect on it and they take more risks. As Sandra focussed on her own progress, which is internal, and developed more positive FL self-concept, she stopped worrying about differences between her Japanese competence and those of the other learners and started taking more risks to speak Japanese.

The first important factor was beliefs related to a growth mindset, which shaped the learner's learning actions to reduce the gap between her ideal and real L2 selves. The learner's perception of the reduction of the gap between her ideal and real L2 selves gave her confidence, a sense of security to use the FL, and the feeling of progress, which led her to create more opportunities to use the FL and take more risks. While conflicts between the learner's belief and learning actions did not contribute to the development of a positive FL self-concept, more consistency between those factors resulted in the decrease of the gap between her ideal and real L2 selves, which ended up developing her positive FL self-concept. Therefore, consistency between beliefs and learning actions are also crucial factor. The increase of familiarity with learning contents and environments as well as the other learners also supported enhancing a sense of security to use the FL more often, which seemed to lead to the decrease of the gap between ideal and real L2 selves. The other important factor was the feeling of progress as a result of perceiving the reduction of the gap because increased feeling of progress appeared to make the learner take more risks without worrying about social comparisons, which was essential for the development of a positive FL self-concept.

CONCLUSION

The present study revealed that even in new learning environments, which are stressful periods of time, the learner could reduce her anxiety and develop a positive FL self-concept as a confident FL speaker by making learning actions based on her belief in the importance of practice and reducing a discrepancy between her ideal and real L2 selves, regardless her self-concept as a shy and unsocial person. The learner's FL self-concept was dynamic and contextual.

A positive FL self-concept, which had been developed in a particular learning environment, did not apply for the other learning context. The learner's FL self-concept was closely associated with her belief about language learning and ideal L2 self. Because the

present study is a case study about one Japanese language learner, there is a limitation in generalising the findings.

Nonetheless, this study could possibly be a pioneering one about an FL self-concept of a Japanese language learner, which found important roles of beliefs and ideal L2 self in relation to an FL self-concept. Further studies about FL/SL self-concepts with wider range of languages in various learning contexts would be necessary in the future.

Affiliation: University of South Australia.

APPENDIX A

Questionnaire

1. Name:
2. Age (if you do not mind):
3. Which languages do you speak or understand?
4. Have you learned Japanese before starting the current course? If you have, please write the details (e.g., where and how long you learned Japanese including both formal instruction and self-study).
5. Do you have any foreign language learning experience besides Japanese? If you do, please give details.
6. Why did you decide to learn Japanese? (You can be quite honest. If you decided to learn Japanese as a course requirement, answer so)
7. What is your goal in taking the current Japanese course? What do you expect by completing the course?
8. Please complete the following sentence with your own words.
I believe that foreign language learning is

APPENDIX B

Diary Writing (In the Japanese Course at the Australian University)

I would like you to focus on the following points for your diary writing:

1. If you have watched any Japanese anime or drama, read Japanese comics or listened to Japanese CDs during the week, please write the titles of them and how many times you have done these things. If you have found something new in them or picked up some Japanese expressions, please write what they were.
2. If you have prepared for or reviewed the classes during the week, please write what you have done.

3. In terms of classroom learning, please write what you have found new, easy or difficult. Please write any good comments or criticism about the teaching.
4. Please write about your problems or the points that you are struggling with as well as the points that you are good at.
5. Please write what you felt when you were doing particular activities in classes or at home as well as what you really did (e.g., when you found out something new about Japanese culture, the language or a way of learning the language, a problem or difficulty when learning particular items, and how you felt about it).
6. Please write in the diary as often as possible (e.g., two or three times a week). If it is difficult, please take note when you have done particular activities at home or after Japanese classes at university and add them when you write a diary entry.

APPENDIX C

Diary Writing (In the Japanese Study Abroad)

As well as what you wrote in your diaries in the previous course, you can also write about any Japanese learning experiences outside of the class (e.g., having Japanese conversations with people, watching TV, and etc.), what you found and how you felt during the experiences. Be reflective as much as possible.

Chapter 47

DO ‘RESOURCEFUL’ METHODOLOGIES REALLY WORK IN ‘UNDER-RESOURCED’ CONTEXTS?

*Eric Enongene Ekembe**

Higher Teacher Training College (ENS) Yaounde, Cameroon

ABSTRACT

Teaching and learning is believed to be context bound, as what works in one context may be unsuitable in another context. Appropriate ELT methodologies are chosen in line with a variety of existing variables, including ‘the constraints of the school or educational setting’ (Richards and Rodgers, 1996).

Unfortunately, innovations in approaches and methodologies have mostly been a reaction to learners’ proficiency and the demand for specified competences by the public. This has prompted a series of ELT reforms from the sixteenth century England to the present.

On the whole, reforms in the domain have been addressing vertical concerns as a result of the conservative understanding of the Englishness of ELT contexts. However, in recent times, English has spread beyond the borders of conservatism, thereby pushing the concerns of a homogeneous ELT landscape to more flexible and dynamic spectra of teaching and language use. In spite of this flexibility, the periphery still believes in the methodologies conceived at the Centre for the Centre. Due to the inapplicability of the methodologies in all contexts, a dividing line seems to exist between ‘standard’ contexts and ‘under-resourced context’.

This Chapter argues that the ‘under-resourcefulness’ of an ELT context is misguided, as it is derived from the conception of what is believed to be ‘standard’ and not on the concept of adequacy and sufficiency. Secondly, the Chapter hopes to demonstrate that the ‘under-resourced’ conception of contexts is the result of the inapplicability of Centre-driven methodologies in contexts that are only different and not actually under-resourced per se.

The centrality of these under-resourced contexts in innovating ELT methodologies is posited.

INTRODUCTION

Contextual factors regulate ELT from theory to practice and tend to provide a matrix against which the success or effectiveness of any curriculum is determined. What actually counts as contextual factors are not a set of predictable static variables that can be theoretically factored into the literature. Consequently, contexts tend to differ. Broadly speaking, the context of language learning includes the intrinsic dynamics of the learner, that is, what individuals bring to the activity, the cultural context, the social context, including relationships with other learners and the teacher, the physical environment, the pedagogical context, that is, the task or materials, and the socio-political environment (Larsen-Freeman and Cameron, 2008). Deriving from this, it is possible that any attempt at evaluating the appropriateness of ELT methodologies or the resourcefulness of contexts must first determine whether the methodologies themselves are contextually rooted in the local culture. Adopting such an approach would suppose that the environment and culture of the learners be seen as a natural habitat and not judged on any prescriptive set of values or norms. This wise, the fallacy of attempting to hastily transform natural learning environments into artificial ones to suit a set of teaching and learning cannons would be avoided. ELT contexts in the South have been term ‘under-resourced’ and ‘difficult’ to refer to situations where the difficulties of education range from poverty, cultural barriers, irrelevance of education, geographical barriers to language load (Das and Almekhlafy, 2012). In a more specific sense, it is a combination of the teaching and learning challenges arising from large classes, unmotivated learners, mixed abilities, lack of textbooks, lack of teaching and learning resources, as well as inadequate infrastructure (Toledo, 2001; Smith, 2011; and West, 1960 cited in Kuchah Kuchah and Smith, 2011). Naturally, one would expect time to play on these variables within the concept of evolution, if actually there are fully qualified to be named ‘difficult’ or ‘under-resourced’, but the tendency has been that the problems keep cumulating day by day with each problem generating another till the context becomes complicated and highly problematic (Das and Almekhlafy, 2012). Given the persistency of such a situation, there is the urgency for any critical mind to ask whether such contexts are actually humanly ‘under-resourced’, ‘difficult’ or only deficient from a prescribed pedagogic definition. Otherwise stated, would it be easier for ELT methodologies to meet the deadlines of such contexts or drive the contexts to meet the requirements of existing ELT methodologies? If teaching methodologies are to be hailed for their contextual appropriateness, then the definition of ‘under-resourced’, ‘difficult’ needs to be re-examined. This Chapter argues that the description ‘under-resourcefulness’ of an ELT context is misguided, as it is derived from the conception of what is believed to be the prescribed norm and not on the concept of adequacy and sufficiency. Secondly, the Chapter hopes to demonstrate that the ‘under-resourced’ conception of contexts is the result of the inapplicability of Centre-driven methodologies in contexts that are only different (which is normal) and not actually under-resourced per se.

‘UNDER-RESOURCED’ OR ‘DIFFICULT’ CONTEXTS

I begin this section with an internship report by a peace-corps teaching fellow, Brian Jonson, in Cameroon in 2005 to present not only the supposed ‘under-resourcedness’ and

'difficulty' of the under-resourced contexts but also to examine narrator's consciousness in the narrative.

[...]. There was always the possibility of being sent home, of an article or clothing being inappropriate, of something just not being right. [...] the beating of children on the hand with a stick was common. The Cameroonian teachers said that if this was not done the kids would not listen or learn. [...] Overheads were not available, and making photocopies were not possible. I adjusted to using the blackboard and worked on being an animated teacher.

This narrative paints a picture of the total context of learning in the South, although highly under-researched. Brian's painting of the situation reflects the learners' environment from the socio-political, cultural, economic aspects in addition to teacher quality, whose implications in learning are focal. But the narrator's consciousness is a demonstration of teacher training in what I prefer to call the 'reduced world' (as opposed to the broad world colonized by English), which has failed to accompany the spread of English and has rather stood behind to address it 'not being right'. The inappropriateness of clothing captures the economic situation of the learners and his appreciation of 'always' sending children home reveals a limited sense of judgement, which helped him to becoming an animated teacher.

Another narrative which extends Brian's world and gives a holistic picture of 'under-resourcedfulness' of the contexts is provided by Maley (2001: 1):

Let us take as an example a rural secondary school in Country X, 200 kilometres from the capital. In the Form 4 class, 60 students are crammed into a classroom which would comfortably accommodate 30. They range in age from 14 to 20. Most of the students have walked at least 5 miles to get to school by 8 am. Before that, they had helped with household chores, including collecting firewood, bringing water from the village standpipe and caring for younger siblings. At 9 am the temperature is already 30 degrees centigrade.

The teacher comes to school on his bicycle, after ensuring that his wife's market stall is set up for the day. His own salary, when it is paid, is insufficient to support his wife and their two young children. He has a 2 year teacher's certificate from a rural training college. His competence in the English language is rudimentary. He conducts the English class mainly in his mother tongue, which all the students share.

The textbook the students are using is a pirated edition, dog-eared with use. In this textbook (to spare embarrassment I will not name it) a cast of white characters enact situations in which they shop in malls and supermarkets, watch TV and videos, arrange and go to teenage parties, discuss popular music and movies, go on holidays and so on.

The teacher has a hard time putting this across, not least because he himself has never experienced anything like the antics engaged in by the characters in the book ~ even when he understands what they are. The students, when they understand at all, are bemused, not least because they have no idea why they are studying this strange language in the first place. They know that they must pass the examination though. Outside school they rarely encounter this language, except in advertisements for products they cannot afford to buy, or in pop songs, which they learn to mimic without understanding. One or two of them have relatives who have emigrated to the USA, Canada or Australia. These mythical people rarely return to visit their home village.

The walls of the classroom are dirty and the plaster is peeling off them. The blackboard is pitted and grey with use. There is currently no chalk. There are ceiling fans but no electricity to run them. By 10 am the temperature has risen to 40 degrees centigrade. In the textbook, the young people are dancing at the barbecue. In the classroom, eyelids are already heavy with fatigue. Most of the students have not yet eaten today. A caricature? Sadly not.

Although Maley, unfortunately, comments that the context painted in his narrative may not be true from a global point of view, he later admits that ‘what I have described is the situation in a majority of the world’s English classrooms’ (see Tomlinson (2005: 137) for an appreciation of similar experiences). It is far from the reduced ideal world of pedagogical excitement and innovatory teaching we would like to think we inhabit’ and the bulk of the ELT learners in the world fall within this category of the real world (Smith, 2011). Maley’s polarisation of the characters in the textbook dancing and the teacher who has never experienced anything like the antics engaged in by the characters in the book’ shows the landmark dichotomy between the world of ELT methodologies and the world of learning explained in Birbirso’s (2014) argument against the content relevance of instructional materials in Ethiopia.

The class size of 60 learners in the narrative is just one of the modest examples of class size issues that have contributed to the nomenclature of ‘difficult circumstance’. Kuchah Kuchah’s story retold by Richard Smith provides a clearer picture of the context:

Kuchah’s students were adolescents, most of them between the ages of 16 and 17, with a few slightly below or above this age range. He entered his class on the first day full of enthusiasm and with a determination to use his skills to make his French speaking learners perfect speakers of English. But it was not long before three things pushed him back: the size and practical disposition of the classroom, the lack of textbooks, and the almost unbearable temperature ... The class referred to in this story was made up of 235 students, some of whom had no space to sit inside the classroom and as such were literally hanging in through the windows from both sides of the classroom. Kuchah was left with less than a metre between the front benches and the chalkboard, so that he could barely turn round and write on the board. Benches were arranged in rows with space between each row for teacher and students to walk in and out of the class. But Kuchah’s class had no luxury of space since many more students needed to be sitting in class than there was space for. So his students usually came early in order to have space in the class and latecomers either stayed outside, listening through the windows, or stole in through one of the windows to squeeze themselves into some standing space at the back. This meant that each time a latecomer stole into the class Kuchah had to leave some time for the laughter this caused to die down before continuing with the lesson. In a context where the syllabus is basically examination-centred and where the teacher’s work is measured by the number of textbook units he has covered within a given period, this kind of time-wasting can be very disruptive. Yet Kuchah had no choice but to accommodate to the situation.

Treating these contexts as naturally as they are entails seeing the teacher and learners as humans in communal activities within varied social, cultural, economic, and political ecologies. Being a reflection of out-of-school life, campus life is co-constructed by both the

learners and the teachers, most especially as the experiences lived by the learners are synchronically and diachronically shared by the teachers. Secondly, the economic situation of both the learners and teachers is not getting any better. Thus, what would be considered economically 'disadvantaged learners' may as well be referring to experiences shared by a good number of the teachers, otherwise, such economic colour painted by expatriate researchers and teachers may not be seen differently by the teacher. Thirdly, the demographic explosion experienced by countries in the South is not accompanied with the provision of social amenities. Consequently, classes are bound to be large, especially with governments' interest to meet global agenda- the 'Education For All' Millennium Development Goals (MDG).

Defining these contexts as they present themselves reduces the possibilities of becoming idealistic and thus focus on what is realistic. Nothing in such contexts is inhumanly impossible as learners' thoughts are embedded in the meanings they construct about the world around them. For the contexts, therefore, to be declared 'under-resourced' the learners' faculties would have to be probed into to be sure they themselves see their learning environments as under-resourced or difficult. Worthy of note is the fact that cognition and cultural influences are inextricably entwined and are involved in the process of learning, with serious bearing on education (Schcolnik et al., 2006). The total context of learning becomes a system woven by the inter-dependence and interaction of factors. The outcome of interacting variables, perhaps with a trigger from an external stimulus, is largely unpredictable and unending (Haugen, 2001; Tamjid, 2001); Schcolnik et al., 2006) to the extent that claiming their difficulty or under-resourcefulness may rather seem an attempt to assign constraints to naturally occurring patterns, which rather ought to be defined. It is worth noting that many people in such contexts have succeeded and are succeeding in many areas of life. Defining what actually counts as the constraints of a context may be more pragmatic as it can help us focus on what is realistic and appropriate and thus plan for success (Graves, 2000). Many researchers seem to agree that both curriculum and methodology should only be determined after a consideration of local conditions (Tomlinson, 2005) and not simply be prescribed by 'dictators of pedagogy' who for the most part, are at odds with the cognitive needs of the teacher and alien to the immediate realities of teaching' (Kuchah, 2008).

WHAT METHODOLOGY FOR THESE CONTEXTS?

The contexts described above (TESEP) are different from those in advanced contexts (BANA) (Holliday, 1994) in terms of class sizes, learners' socio-cultural, sociolinguistic and economic situations and have a strong bearing on cognitive factors often exclusively foregrounded in ELT. Socio-cultural approaches to learning emphasise that actual learning is situated and occurs in specific settings or contexts that shape how it (learning) takes place (Richards, 2008). Language learning tends to be determined by the way the child's faculty links its mind and mental abilities to its environment when constructing fundamental syllabuses and hypothesis about social values. It occurs therefore that different contexts offer different potentials for learning. Learning outcomes therefore get embedded in cultural meaning systems as a result of learners' interaction in their immediate and remote environment, defined through social, cultural, and political patterns that constrain the

linguistic forms they hear and use (Watson-Gegeo and Nielsen, 2005; Birbirso, 2014). Zuengler and Cole (2005: 304) cite Willet (1995) as intimating a strong correlation between the socio-political dynamics outside the classroom and learners' participation roles, identity, and classroom ideologies, which have most often been overlooked.

As Watson-Gegeo and Nielsen (2005) warn, the cognitive/social dichotomy widely taken for granted in second language acquisition theory obscures the relationship between the knowledge about language that learners construct and the social, cultural, and political contexts in which acquisition takes place. Learning outcomes in each context tend to inform instructors and researchers on what is methodologically (im)possible. This supposes a policy of adaptation of teaching methodologies to the effect of contextual relevance, but, unfortunately, the link between policy design and implementation is commonly understood to be fragmented. Factors ranging from low infrastructure, poverty, poor training, paucity of teachers, lack of interest from key actors etc. are untactfully believed to be the cause of the broken link (Schweisfurth, 2013; Bolitho, 2012).

Although Butler (2011) regrettably noted that we still have only a limited understanding of how best to achieve contextually embedded adaptations and how they affect students' English learning, various attempts have been made to demonstrate pedagogical innovations that may enhance learning in such contexts. Kuchah Kuchah and Smith (2011) argue for a pedagogy *for* autonomy as against pedagogy *of* autonomy as a plausible strategy of reducing time-on-task and encouraging learner engagement in such contexts. Equally, Maley's experience in getting students to find natural sources of pigments and getting pieces of cloth salvaged from the floor in seamstresses' shops to construct learning materials (Maley, 1999: 4) demonstrates how the creative construction framework within the context of 'authentic materials' can be a suitable response to lack of course books. Drawing from his experience training teachers in rural areas in Ghana, Maley opts for a methodology that involves the whole educational experience rather than a narrow, ELT approach.

Tomlinson (2005: 147) cites Holliday as advocating a methodology based on existing cultural resources to motivate learners in educational settings. Of course, and as has already been argued, such cultural resources definitely differ from one ecological setting to another. Chun-hua (2009) reflects on the differences of ELT experience in China and that of other parts of the world and suggests a crucial understanding of the nature of language and language learning to be able to adapt possible learning theories to the Chinese context. However, Tomlinson (2005) credits learners for their dynamism, as they are usually willing to adapt to new cultural experiences in teaching- a major option for practitioner. On the whole, it is universally acknowledged that being taught in culturally-appropriate ways raises achievement (Schwesfurth, 2013 citing Sternberg, 2007), other factors held constant. More arguments to culturally-appropriate methodologies abound. Although the general tendency for students to prefer receiving corrective feedback is believed to be consistent across most contexts (Sheen 2004), some studies have reported that the strength of the preference varies according to learners' cultural backgrounds, previous and current language learning experiences, or proficiency levels (Lyster et al., 2013).

A characteristic feature that has led to the description of under-resourcefulness of classrooms in the South is the class size threshold. Kuchah Kuchah's class referred to in this Chapter (to take this as an example) far more than triples the threshold in BANA contexts. Despite the fact that this has largely contributed to the description of the context of teaching as under-resourced and difficult, researchers are yet to conclude on how large class sizes

affect achievement. The value of the positive effects of small class size on achievement, a research interest that upsurged after the Tennessee project STAR (Nye et al. (2001); Finn and Achilles (1990); Finn et al. (2001)), is challenged to be non-significant. Another argument to the insignificant outcomes is that the methodologies often used in such studies are anecdotal (Blatchford et al., 2011). Ehrenberg (2001: 4) draws from the National Assessment Educational Progress (NAEP) spanning 1996 to 1973 to observe the mismatch between class size reduction (CSR) and the level of achievement. There is actually little evidence to claim a one-to-one mapping between smaller class sizes and achievement as often insinuated in correlation studies, especially as some student groups may benefit more from being exposed to experimental designs than others (Konstantopoulos, 2010).

The class size debate is, for the most part, confounded with teacher quality, as the interest in correlational studies has been to treat class size as exclusively accountable for achievement. Teacher quality is argued to have a significant effect. For example, lower quality teachers are unlikely to increase learning than existing ones as much as experimental evidences predict (Ehrenberg, 2001). In essence, it is believed that class size only matters for inexperienced or low-quality teachers as more effective teachers are better able to adapt their teaching styles to accommodate larger classrooms (Schazenbach, 2014). There is also very little evidence to guarantee the effectiveness of teaching in smaller class sizes as teachers are less likely to change their teaching strategies according to variation in class size (Wilson, 2002).

Some experiences that have sought to demystify the commonly noted classroom challenges posed by 'under-resourced' and 'difficult' contexts of learning tend to shift the paradigm. Maley's (2001) focus on learners' out-of-school life, interests, and problems to build teaching activities was instrumental in fostering language development. Hedge (2000) notices that such options bear heavily on the choice of resources and classroom procedures although she thinks they are outside the teachers' control, a premise critically challenged by Kuchah Kuchah's experience as noted in Kucha Kuchah and Smith (2011: 133):

The fact that Kuchah was able to engage in this form of practice with a class of over 200 pupils highlights the inadequacies of beliefs within North contexts that a pedagogy of autonomy is only possible with small classes of motivated learners. Kuchah's story provides support, indeed, for the counter-argument that if Kuchah could engage with students' autonomy in such difficult conditions, other teacher should be able to at least attempt this kind of approach in their own, much more favourable circumstances.

Learners' success experience in Kuchah's narrative could not be analogous to teachers' experience given their agentic roles in the co-construction of the learning contexts. Teachers in such contexts can naturally develop autonomous responses to such difficulties as did Kuchah's learners. The major difficulty in getting them to do this is that, for a long time, teachers *have been made* (our emphasis) to place the problem outside of themselves (Schweisfurth, 2013).

The reason for which teachers have placed themselves out of the problem is double folded. Researchers' intuition about instructional strategies seems to posit the centrality of reduced class sizes in the effectiveness of teaching. For instance, Poole (2005: 52) states that interaction involving focus on form seems optimally suited to classrooms that are small enough to enable instructors to verbally address problems faced by students, through

classroom discussion. He argues that small classes would be needed for students to have significant amounts of peer interaction, both orally and in written form. Sheen (2004) advocates the effectiveness of recast and uptake opportunities in smaller classes. In addition, most experiments on the effectiveness of instruction have very small number of participants in research-based classrooms, giving the reader and/or teacher a cosmetic view of the classroom. Thus, transporting Brian's (the narrator) overhead projector to Kuchah Kuchah's classroom cannot be said to lead to better learning outcomes, at least, on a comparative note.

Teacher training materials used in under-resourced contexts are Western oriented having little or no consideration to the actual learning contexts in the South. This is a commonly neglected side of the story. Research attempts in this regard have been limited to the materials available to learners. It should be borne that most teacher trainers were trained under the influence of Western ideologies and concepts, and the question of contextualizing instructional models has remained highly theoretical to them and has not actually been their interest given the robustness of teacher education in the contexts. It is supposed that 'ELT teachers in Cameroon are not prepared academically and professionally for the new pedagogic expectations that highlight the learner and learning process (Tchombe, 2013). This explains why trainees get to realise the inapplication of teaching methods and techniques only when they get to the field for teaching practice, with no corresponding feedback. Kuchah's enthusiasm and determination 'on the first day he entered his class to use his skills *to make his French speaking learners perfect speakers* (our emphasis) of English' and the fact that 'the size and practical disposition of the classroom, lack of textbooks, and the unbearable temperature' was a new experience to him are clear illustrations of the disconnection between training and practice. It could be argued that the strong correlates between teacher training and teacher performance are checked by other job-related factors. Any teacher preparation that underpins theoretical concepts to the constraints of the teaching/learning environment, or problematises training, succeeds in neutralising the possibilities for tension between the teacher and the context of teaching (Feuer et al., 2013). It has already been noted that teacher quality may be more implicational in student achievement than class size (Dee and West, 2011), availability of resources, and teacher quality (it must be stressed) largely depends on preparation and continuing professional training. In a casual survey of ELT course outlines of three teacher training colleges in Cameroon (carried out at the time of this research), none of them had anything to do with class sizes issues, resources, and even NITCs in a context and era where class size, under-resourcefulness, and information technology are topical points in extant ELT discourses.

Due to a misconception of the relationship between the learners' environment and learning, Western developmental agencies have invested huge financial resources to cause a change. Birbirso (2014: 15) is critical about the embarrassing billions of dollars allegedly spent on a single sector- education, which has led to no corresponding meaningful change in Ethiopia. Although he blames this to the bureaucratic regimes, the problem seems to be the result of the imported view of the concept of change that accompanies the funding. Top-bottom change that is not developed from indigenous experiences is less likely to be sustainable. The IATEFL and the British Council seem to be aware of this lapse and are giving a pragmatic response to the problem. For example, the IATEFL's funding to the Cameroon English Language Teachers' Association- CAMELTA (through its Research Special Interest Group) to collect evidences of teachers' experiences in the 'under-resourced'

Cameroon classrooms has a more psychological influence on the revolution. Through this project, Cameroonian teachers involved in the project, for the first time, have the opportunity to reflect not only on the challenges posed by the nature of their classrooms, but also on the nature of the challenges. This opens the possibilities for hands-on-deck solutions to the supposed challenges. Such an approach marginalises the possibilities of subjugating and disempowering the teacher with top-bottom approaches to teaching. It is an automatic initiation of the teachers into autonomous inquiry into their difficulties, as professionals, which ignites a strong foundational psychological response to the problem. As Richards and Lockhart (2005: 2) note, this process can help achieve a better understanding of one's own assumption about teaching as well as one's own teaching practices; it can lead to a richer conceptualization of teaching and a better understanding of teaching and learning process; and it can serve as a basis for self-evaluation and is therefore an important component of professional development.

This approach to the problem is different from the kind of consciousness that is the result of Western-oriented training as well as that which is informed by the 'outsider' perspective. Such IATEFL initiative in Cameroon conforms with a bottom-top approach to developing a context-specific reaction to what is believed to be problematic in such contexts. Equally, the British Council Hornby School's (see Shamin et al., 2007) provision of opportunities for teachers to reflect and publish context-based reactions to the challenges is a pragmatic response to the problem, especially as those involved in the project tend to be psychologically empowered to overcome the 'under-resourcefulness' or 'difficulty' believed to characterize the contexts of teaching. Unfortunately, such buoyant initiatives are restricted to a limited number of participants who receive new identities after their participation in such projects and, in turn, work harder to become on board any such further initiatives rather than transfer the technology. Consequently huge budgets continue to be spent with only triggering corresponding appropriate effects.

RESOURCEFUL METHODOLOGIES FOR THE 'UNDER-RESOURCED' AND 'DIFFICULT' CONTEXTS

Having argued against erstwhile conceptions of the under-resourcefulness of teaching contexts in the South and seen theoretical arguments in favour of contextualizing ELT methodologies, an examination of some teacher practices in such circumstances gives a practical orientation to 'matching procedures with context' (Tomlinson, 2005). The data discussed here is obtained from a collection of teachers' on-the-spot reaction to the problems they face in 'under-resourced' Cameroonian classrooms coordinated by Richard Smith and Kuchah Kuchah, an extension of the review done by Smith et al. (2012). The data selected for discussion is intended to demonstrate, from a qualitative perspective, the potentials of indigenising ELT practices where local constraints allow limited opportunities for applying fully developed techniques. The participants in the project were ELT practitioners in the Cameroon English Language Teacher Association (CAMELTA). They were required to express the challenges they face teaching in the 'under-resourced' Cameroonian context and report any of their successful lessons in the context in question. The questions addressed by the respondents and which are considered for discussion here are:

- 1) What are the major problems you face in your teaching situation - what is problematic and why?
- 2) Please describe anything you have done to address (some of) the problems in (2) above. Was this successful? Why / Why not?

While the data reveal a lot of inadequacies related to language proficiency of the teachers; the understanding of the nature of language learning; and general teacher quality, our interest in the data is directed towards a few instances of success. The intention is to examine the teachers' creative response to difficulties to posit context-appropriate innovations. A striking issue noticed was that the exaggerated under-resourcefulness expressed by Western commentators was not expressed by the respondents in the project while the frequently stated problems include lack of course materials, low proficiency of learners and managing overcrowded classes. Other issues were only implicitly stated.

In presenting the data, attempts have been made to exclude the problems posed by the respondents where they are discernable from the solutions provided.

LACK OF COURSE MATERIALS

Respondent 2

To address the issue of the lack of textbooks by learners, I begin each academic year by insisting that the students have the books. I use threatening measures like: I will keep you out of you do not have the text, you will not write the first test, I will not mark your paper, I will not register your mark, etc. each time I voice out this threat I find a few more coming with textbooks. This now brings the issue of parental neglect and irresponsibility. By the end of the first two months of school reopening, of the fifty students in class this frightening measure yields fruits and I can have thirty-five books in class instead of the five I originally started with. I judge this my strategy is successful because, of a bench of two students there often two or one textbook available.

Respondent 3

To cope with the situation, I use the following strategies: Assignments are part of annual test grading. Those who lack the textbooks make an effort to beg or buy. Sometimes I write the tasks on the board for them to copy. The success of these strategies has been good and I look forward to better ways of helping my learners in this domain.

Teachers' reaction to the problem of textbook shows that it is the least and even most fragile of problems. The respondents admit the success of using pressure strategies and threats to get the majority of students acquire course materials. For parents to buy course for their children materials upon threats and pressure translates the negligible attention given to education in the whole context. Educational priorities in Cameroon have been displaced by corruption, and having things done through any means tends to be the norm in many situations. This affects the expected attention to learning within the total school contexts as supported by the following respondents:

Respondent 33

The major problem I face is lack of interest on the part of the students. I happen to teach in a locality where there are gold mines and most students prefer going to mine gold instead of going to school. They come to school for formality and look English as not very vital for their future. I also face some difficulties in large classes especially in classroom management. Another difficulty which is most common is lack of text books and research materials for teachers. Above all these, what is really problematic is that of lack of English teachers. I am the only trained teacher and with the bulk of work, it becomes difficult for me to carry out effective teaching.

Respondent 5

Mengang is a purely French speaking area and most of the students' escape from English language classes. Again if the syllabus has to be covered even up to 50%, it should be during the first term because most of them stop schooling at the end of February, most of the girls get pregnant during the academic year, the boys abandon school to ride motor bikes etc. the worst problem is that of course books. The mentality of the people of the area is very funny. It is very normal for parent to come to school, attack a male teacher for refusing to fall in love with his daughter, take home assignments are never done etc.

For parents to show concern for their children's emotional life at the expense of learning materials gives a strategic orientation to cultural variation in Cameroon's educational settings. In a context where education is a means to life, parents will not wait to be presurised to acquire basic textbooks for their children. At any rate, the pressure from the teachers yields benefits without generating any social crisis. This is an opportunity for policy to ensue. Either school administrators develop local policies to get students enrolled for the academic year upon provision of basic course materials or the government takes action towards that. Otherwise, teachers could develop such a strategy to get the students acquire the books. This may not be very successful in very remote areas, but getting half the class acquire books greatly reduces the challenges that are expressed as a result of this. Lack of text books does seem to pose a 'difficulty' as is too often articulated in research.

Kuchah Kuchah got his learners to look for written text as a response to lack of course books (Kuchah and Smith, 2011). Getting students to bring passages or texts to class and designing learning around the materials together with the students reverses traditional classroom roles and responsibilities and tends to decentralise the construction of knowledge. Learners feel excited when encouraged to assume teacher roles, as this provides a horizontal exchange of knowledge that is not constrained by the anxiety resulting from the top-bottom cognitive approach and the monopoly of knowledge that have characterised teaching in such contexts. A similar response to lack of text book is provided:

Respondent 42

After a meeting with other colleagues, we talked about teaching without a text book. In a story telling class I read a story to the class "how the tortoise defeated two giants". It was a primary six story read to form three students. I left out the end and asked the students to write out the story and give it an appropriate end. They came up with beautiful ends. I have used their stories for many different purposes like comprehension, vocabulary and grammar etc. I learned this from Mr. XXX who says he learnt it from CAMELTA in Yaounde. Now I can teach with no text books.

Respondent 140

Unlike in the past where I used to find difficulties in letting students excel in reading due to students lack of interest, especially with no or a few textbooks in class, I could now realize that a good number of them enjoy reading being able to answer set questions, summarize passages well and others. Actually such success was because I had to discover that reading can be done without a text book wherein I had to present the beginning of the story (story interesting ones) asked students to attempt completing the story, following given instructions e.g., complete the story portraying junior as a bad child; as a good child etc. they did drawing, wrote poems, build vocabulary surrounding the story etc. in the end, they succeeded in producing their own passage.

The teacher's approach to using learners' text (also see respondent 42, part two of the data) is based on two methodological stances: Reading for skills development and reading for language study. This deviates from the traditional approach to teaching reading- reading to answer comprehension questions. Thornbury (2006: 192) provides a theoretical backing to the respondents' approach.

He believes that 'classroom reading texts should be exploited, not just for their potential in developing reading skills, but as sources of language input'. Teachers in this context are used to traditional approaches to teaching reading, and thus find the task difficulty for them when confronted with a situation of unavailability of textbooks. Exploring strategies like the ones used by the respondents above reduces over-dependency on text books and the whole question of 'lack of textbooks' tends to be a marginal classroom problem, which must not necessarily be associated with contextual difficulties.

One common course book factor often overlooked is that high dependency on them drives the writer's world view through the learner and even the teacher, allowing very limited opportunities for learners to see the world outside the writer's angle.

They also exercise and foster a dominance tendency over learners and give them very little room to contribute their experience towards certain life concepts in the process of learning. In short, they control what the reader has to know as far as comprehending the texts is concerned. Consequently, what the reader understands from the text tends to be determined by the author's expectations.

This already places the reader at a 'difficult' position. This overall comprehension 'stress' tends to be demystified when learners think they also have the opportunity to control what is to be understood. These respondent's learners were able to generate knowledge with 'beautiful ends', which outsourced the teacher with 'authentic' material to use based on an integrated teaching perspective, a more realistic alternative to text books. The source of the teaching technique may be credited for empowering the teacher, but the learners got more empowerment through the application of the procedures, as they were able to explore and put to bear a panoramic sphere of their experience using language at the most comprehensible level.

THE QUESTION OF LOW PROFICIENCY

Low proficiency of learners has been cited in the literature as a characteristic feature of learners in under-resourced contexts. Proficiency is determined through the learner's ability to

handle target tasks and is usually measured against the Council of Europe's Common European Framework of Reference for languages. Learners' proficiency determines the level of language they have acquired and enables stakeholders to place learners with similar abilities in the same levels of study. This is not the case with mainstream schools in the South in which language learning levels are determined by holistic educational competences and not by the learners' language proficiency. The consequence is to have classes of extremely mixed abilities. This appears to be what renders the contexts even more 'difficult'. This was articulated by some of the respondents and an analysis of their opinions is necessary to verify their current assessment of the issue and how they deal with the challenges.

Respondent 41

For the problem of reading that is pronunciation of words, I as a teacher use letter cards and word cards to teach the pupils during lessons. I also give them home work on sounds and words building to take home and practice. I was successful to an extent in that those pupils who are present in school everyday do repetition before our next lesson. Not also successful to an extent in that some pupils are not regular in school so by the time they come back, they have forgotten what was taught.

Respondent 38

Concerning spelling, they know the vowel sounds and consonants. I do spelling and mental drill every morning with them. Concerning handwriting I make sure they use the red and blue line very well that of a child makes a mistake by not writing well I will ask him or her to rewrite and so they do improve.

Respondent 49

The problem of sounds and word building. This is because most of the pupils did not have a good foundation in sounds. Some of them were taught the letters of the alphabet and not the sounds. Children not having all the necessary materials needed some children are also underage which makes understanding difficult.

Those with this problem are asked to bring 20 leave exercise book to use for follow up activities, We have started with the sounds of the alphabet and identifying them. To an extent it is successful because some of them can now sound and identify the different sounds of writing materials I have sent a note to all the parents and they are responding.

Respondent 30

The main problem is the language. As a teacher of English language to French-speaking students, I find myself repeating the same things without being able to make the students understand. They will either say "Madame on ne comprend pas l'Anglais" or "C'est Dieu que donne l'Anglais." What is problematic is that I am sometimes forced to translate certain words for them to understand and I don't think I help them by translating each time.

Some of my translations and summaries have helped some students to understand certain things better. As they say, "Ah! Madame on comprend maintenant", "Donc c'était ça?" It has also helped them to feel relaxed in class and to feel free to ask questions.

Deriving from the respondents' reactions, a series of strategies are believed to have been used by the teachers to deal with problems arising from mixed abilities and low proficiencies. The most important aspect of the strategies reported is the teachers' abilities to identify and problematise and seek attempts at addressing the issue without expressing a sense of frustration. Respondent 38 and 41 are able to rate the effectiveness of their instructional strategies - a routine rubric of spectacular reading activities and mental drills- from the progress their learners make in the identified areas. Respondent 49 identifies learner-instruction matching as a way of paying attention to learners' particular proficiency needs in the classroom while Respondent 30 uses grammar translation to cause noticing and create motivation in order to influence learners' proficiency levels. Although the variety of strategies used to deal with low proficiency and mixed abilities problems might have been borne out of the need to deal with context-specific classroom difficulty, they expose the teachers' desire to furnish *extra efforts* to deal with classroom challenges than may be needed in standard classes (also see Respondent 6 in part two of the data). The type and degree of extra efforts needed can only be determined by the nature of the problem as rated by the teacher. This is the positive advantage of the reciprocal correlates between large class size and teaching (Blatchford et al., 2003). It would be very surprising to get any of the teachers (respondents) tell you when it is appropriate to use any of the instructional techniques they used prior to their exposure to the challenges. Thus, their success is not the result of application of any theoretical knowledge but the natural need to deal with a challenge.

CLASSROOM MANAGEMENT

Classrooms are social communities with multivariate activities and behaviours that co-construct learning in particular ecologies. Learning in the classroom is dependent on natural factors related to classroom and the school environment in which learning takes places, learners' background, motivation, and the broader community influences (Ehrenberg 2001; Blatchford 2003). Thus, stressing the correlation between class size and achievement has been criticized for not only being reductionist in design but for reducing the classroom to an artificial world in which humans can be controlled for experiments. Managing classrooms may not always require discipline-specific knowledge. This is proof that more humanistic approaches may be more responsive to what is identified to be classroom difficulties. Research has undoubtedly demonstrated variables which affect classroom management when classes are large: teaching time, groupings, attention to students, pupil control and marking, planning and assessment (see Blatchford, 2009, for example).

It has already been stated that children in large classes are twice as likely to be off task given that the larger the class, the more distracted the children (Blatchford et al. (2003); Blatchford et al. (2011); Schanzenbach (2014)) leading to estimated unproductive learning outcomes. There is a usual tendency to associate lack of engagement in learning with negative outcomes, as students in larger classes tend to feel more anonymous and are therefore more

likely to not stay engaged with the material (Gleason, 2010), although the effects of lack of engagement on outcomes in online learning were found limited in Gleason's study. The opportunities for interaction, willingness to interact and the time required for interaction are believed to be largely marginal in large classes compared with the occasions provided by small classes (see Laria and Hubbell, 2008 for specific details). Blatchford et al. (2003) noticed that, in a large class, children interacted more with each other and spent more time not interacting. The challenges faced by the respondents all point to the compounding classroom management variables stated above. Apart from group work, which was noted to a characteristic reaction to management problems in the classroom, some less commonly-stated strategies were noticed.

Respondent 50

The major problems I faced were class room management, classrooms that are too populated, some teaching methods and the noise makers and inattentiveness. It was a problem because when the class room is too populated; many pupils will not really concentrate especially the back benchers. Many of them will be disturbing or doing something else thus losing attention in class leading to failure.

Firstly, I make the classroom to be lively, at times I ask them to sing some short or common songs for relaxation. Secondly I will tell them that if anybody pays attention in class when the teacher is teaching he/she is going to pass well and I will also give the pupils a gift such as pen, pencils, ruler book to be using. With this they will be attentive in order to receive the gift promised.

Respondent 65

Behavioural problems from the students indecent attitudes like disturbance, noise making, poor sentence structure, wrong use of the capital letter, lower and upper case letters.

As to the problem of disturbing during the lesson, I swap the seats of such students. Also, as concerns poor sentence structure, wrong use of lower case and upper case letters, emphasis has been made. All these measures have been successful to an extent.

Respondent 94

The main problem is that some of the pupils are not serious as well as being attentive in class and they also speak a lot of Pidgin English in class. As a result of that it is a problem because they cannot speak as well as construct good statement in English.

Concerning the problem of Pidgin English I have tried to upgrade them by explaining to them how to use the various tenses. Also the problem of not being attentive in class has also been solve as at the beginning of each lesson I first of all captivate

learners interest by singing, dancing, presenting of attractive and colourful pictures and flowers. As all those has been done all east there is a big change.

Some of the strategies used by the respondents- such as changing sitting positions- to deal with classroom management problems have been identified by Shamin et al. (2007: 27). Other non-cognitive strategies used by the respondents (singing, dancing, using pictures, and giving incentives to learners) to attract learners' attention unconsciously breach the gap between classroom atmosphere and the learners' ordinary day-to-day experience. To the best of our knowledge, there is no evidence suggesting their effectiveness with regard to learning outcomes, yet the strategies used by the respondents help to reduce anxiety in the classroom and could be a good approach to initiating the learners into the cognitive rhythm of the lesson. The strategies also create variation in the classroom. In standard class size contexts, many teachers have developed robust teaching strategies and tend to neglect the value of variation in teaching strategies even when class size changes (Laria and Hubbell, 2008). It is hypothesized that teacher quality could undermine traditional positions on the effects of class size (Dee and West 2011), although what counts as teacher quality remains contentious. Teachers' abilities to handle classroom challenges have been reduced to language proficiency and awareness in theoretical issues in language pedagogy. This explains why it is suggested that teachers with high value added on standardized test scores have an impact on subsequent outcomes for their students as wage earnings (Schanzenbach, 2014).

The techniques used by the teachers have very little to do with the indicators used to verify teacher quality, yet they were able to come up with means of dealing with classroom challenges based on experiential judgement. It is not very difficult to assign such techniques (as giving incentives to learners) to a theory or methodology although sustaining such strategies would entail empowering the teachers with the resources to use- a more difficult option for stake holders. Techniques of that sort may be challenged for conditioning attention in the classroom. However, giving incentives to learners has been noted to be a productive feature that promotes learning (Bain et al., 1989) and could specifically be associated with its value to enhancing effectiveness on time-on-task and solving attentional problems related to class size and management. This falls within the framework of instrumental motivation, which can be fostered through crediting learners with marks instead of material gains.

The respondents in the project used the commonly-stated group work as a management technique. This has been proposed as an effective way of managing large classes (Baltchford et al., 2003; 2009; Shamin et al., 2007). The idea of group work has been a proper classroom management strategy initially associated with standard class sizes and has only been appropriated by teachers for use in large and under-resourced classes on a need basis. The relationship between number of groups per lesson, group size, and teaching time has been examined by Blatchford (2009). However, one way teachers might make the most of classes is to consider helping learners towards effective group work (Blatchford et al., 2003). It is estimated that teachers find it difficult manipulating these variables due to class size reduction orientation during teacher preparation (Wilson, 2002). It is therefore important to design teacher training programmes both initial and continuing to consider ways of adjusting productively to contextual features like class size (Baltchford et al., 2003).

CONCLUSION

The need for English Language competences to meet communication needs on the global scene has prompted methodological innovations in language pedagogy. The pressure to satisfy international requirements of English has pushed experts to develop strategies whose application in the expanding contexts of English is not given sufficient attention. Sheen (2004) argues for smaller class sizes to ensure interaction in the classroom; Poole (2005) thinks that form-focused instruction is suited in smaller classes; Schwesfurth (2013) observed the impracticability of implementing learner centered education in low income countries. Yet class sizes in the Southern hemisphere continuously get larger and are said to be under-resourced to the extent that the contexts are believed to be 'difficult'. Recent innovations in teaching have sought to demonstrate that such understanding show a limitation in the relationship binding teaching/learning and contextual factors. Blatchford et al. (2003) proposes learner-learner interaction as a response to large class size; Kuchah Kuchah and Smith (2011) argue for pedagogy for autonomy; a correlation between teacher-led interaction, learning styles and learners' proficiency is argued to favour learning in rural contexts (Ekembe 2014). Equally, some aspects of pedagogical practices may be more responsive to such contexts than others. In all, the best way forward is to try to fix the broken cycles of implementation which have proven barrier (Schwesfurth, 2013).

Drawing from a range of strategies used by the teachers sampled by the Kuchah Kuchah and Smith research, there seem to be an unconscious emancipation from imported methodologies driven by the need to survive amidst the constraints posed by local realities rather than by the need to meet methodological deadlines. One of the respondents admits that there is always a way out, as if to confirm Maley's (2001) position that a few economic deprivations do not suppose emptiness of the context. It is possible to imagine that teachers in such contexts would do better in well-resourced and standard classes if given the opportunity, yet no causality of effects has been proven in the literature this far. The claim that the contexts are under-resourced may not be very much related to adequacy and sufficiency of resources. It seems rather to be more related to some sort of psychological constraints driven by cognitive limitations of adapting Western-driven pedagogies in different contexts of learning. To provide a more context-based solution to the problem, although it may be radical to get learners involved in making decisions of content and methodology, a sound understanding of their needs and expectations, of their abilities and difficulties, of the realities within which they operate is very important in taking decisions that will affect their education (Kuchah Kuchah, 2008: 217).

Equally, the mutual collaboration between teacher education institutions and practitioners in redesigning teacher preparation programmes to train teachers suitably apt to address the realities of educational contexts could easily dilute the thinking of under-resourcefulness and difficulty. In such a situation, the whole question of under-resourcefulness and difficulty may not hope to find answers in the provision of resources; use of standardized methodologies; and reduction of class sizes, but rather in teacher responses to the situation.

The intention in this study has not primarily been to analyse the data, but to draw from a few samples to demonstrate how methodological incompatibility with contextual features has pushed teachers to develop automated behaviours in the face of constraints believed to be characteristic features of classrooms in the South. It is necessary to complement this with a

quantitative design to be able to determine the prominence of various problems and to collocate instances of innovative responses to the problems with more qualitative evidences. This is needed to paint a clearer picture of how indigenised ELT strategies tend to address the supposed difficulty of the context of teaching and learning.

Chapter 48

‘FROM MICHELANGELO TO PICASSO’: IMPLEMENTING THE CLIL APPROACH IN A FOREIGN LANGUAGE PROJECT

Evangelia Anagnostou, Eleni Griva* and Kostas Kasvikis

University of Western Macedonia, Greece

ABSTRACT

Having considered the data of previous studies related to certain benefits of CLIL on students' linguistic and cognitive development, a project was piloted with 6th grade students (aged 11-12 years) of an experimental primary school in Northern Greece. The project, *From Michelangelo to Picasso*, aimed at introducing some aspects of cultural history in an alternative way and creating an educational environment that favors the art experimentation and expression in EFL (English as a Foreign Language). The project comprised 10 thematic axes that included all the important artistic movements from 15th to 21st century: "Renaissance", "Baroque, Rococo", "Neoclassicism, Romanticism", "Realism", "Impressionism", "Post-impressionism", "Expressionism, Fauvism", "Cubism, Abstract Art", "Surrealism", "Contemporary art (Abstract Expressionism, Pop Art, Performance, Installation, etc.)". The project was carried out in three stages: a. The 'Pre-task' stage, where the students were introduced to the historic, artistic and ideological framework and the key-artists of each artistic movement. b. The 'Task-Cycle' stage, where the students were engaged into various group tasks involving experiential learning, problem solving and creative expression. In such an activity-based context students were exploring, communicating, and elaborating content knowledge in the target language. c. The 'Language Focus' stage was carried out in a game-based context. Activities such as role play games, pantomime, creative workshops, exhibitions, artistic presentations, quiz and puzzle games, debates, empathy were at the core of every thematic unit. In order to estimate the effectiveness of the project, multi-method approaches were employed such as, content-specific and FL pre/post tests, role playing, journals, portfolio and questionnaires. The data suggested that the CLIL module contributed to improving specific vocabulary and enhancing students' communication skills. Concerning the subject matter, they expanded their knowledge on history of art

approaching experientially and creatively the artistic, historical and ideological framework of the development of art in the western world.

Keywords: CLIL (Content and Language Integrated Learning), Art Education, EFL, game-based learning, task-based learning

INTRODUCTION

During the last decades there has been a growing interest in promoting multilingualism and plurilingualism in the European Union, so that European citizens are able to respond to the high demands of our society (Popescu, 2008). In line with this goal a variety of teaching approaches have been proposed, with the Content and Language Integrated Learning (CLIL) being at the core. CLIL is an umbrella term used to describe an innovative teaching approach where subjects or parts of subjects are taught in a second/foreign language (L2/FL). This educational approach aims at promoting the simultaneous learning of a target language and the content of a subject (Marsh, 1994) in an attempt to improve students' language skills and enhance their content knowledge. CLIL can be applied to any level of education, from primary to higher, by teachers who are native or non-native speakers of the target language (Marsh & Hartiala 2001 c.i. Jäppinen 2005) with the purpose to promote the active construction of knowledge through students' participation in meaningful tasks and their collaboration and interaction with the classmates (Vilkancienė, 2011).

Recent research has indicated that the CLIL approach is beneficial for the students in their attempt to improve their language skills (Calviño, 2012; Fuentes, 2013; Griva & Kasvikis, 2015; Korosidou & Griva, 2013; Várkuti, 2010; Vilkancienė, 2011; Yamano, 2013). More specifically, students in CLIL classes proved to become more fluent speakers and communicate much better than their non-CLIL peers (Alonso et al. 2008, Admiraal 2006, Harrop 2012; Dalton-Puffer, 2008). The development of students' communication skills is attributed to their increased exposure to the target-language through authentic content and in authentic communicative context. In such a context, students become more motivated to use the target language in order to interact with their classmates and complete the highly demanding tasks assigned to them (Vilkancienė, 2011), as well as they become more flexible communicators in real life situations (Dalton-Puffer, 2007; Lasagabaster & Sierra, 2009). Furthermore, CLIL students seem to have a clear advantage in terms of their receptive skills in L2/FL, general and specific vocabulary acquisition, and oral language skills (Dalton-Puffer, 2008; Korosidou & Griva, 2013; Paradopoulos & Griva 2014; Sánchez Pérez & Salaberri Ramiro, 2013).

Although some concern has been expressed by educators about the learning outcomes, when teaching a school subject in a FL (Hajer 2000 c.i. Dalton-Puffer 2008), CLIL programs have so far proven such claims as ungrounded. Research outcomes have revealed that the implementation of CLIL approach does not affect negatively the subject-matter knowledge (Admiraal, Westhoff & de Bot, 2006; Jäppinen, 2005; Papaja, 2008; Stohler, 2006; van de Craen, Ceuleers & Mondt, 2007; Vilkancienė, 2011). On the contrary, CLIL students' performances in the subject content were higher than their peers who were instructed the specific content in their mother tongue (L1), through a traditional teaching method (Dourda et al., 2014; Jäppinen, 2005; Griva & Kasvikis, 2015; Mattheoudakis, Alexiou & Laskaridou,

2014; Papadopoulos & Griva 2014). The reason behind this outcome is that the highly demanding tasks assigned to CLIL classes motivate students to work harder, and resulted into activating higher order processes and as a result developing cognitive skills, meta-cognitive skills and academic language skills (Bonnet 2004; Dalton-Puffer 2008).

Furthermore, CLIL projects have often been associated with the promotion of cultural awareness (Gimeno et al., 2010; Griva & Kasvikis, 2015; Harrop, 2012; Kiraz et al., 2010; Pavón, Vázquez & Ellison, 2013; Popescu, 2008). Language and culture are strongly interrelated, but this does not necessarily mean that children become culturally aware through language classes. However, students in a CLIL class use the target language to communicate with their counterparts and explore the content of the subject-matter. When the content knowledge of CLIL projects is related with aspects of cultural diversity or the CLIL classroom consists of children of different cultural backgrounds, there are many opportunities for students to be aware of multiculturalism. In that way, they understand deeper not only the others but also themselves, as they obtain the ability to communicate with people from different cultural backgrounds and establish various kinds of cultural exchange (Gimeno et al. 2010). For example, the implementation of a number of pilot CLIL projects interweaving learning a second/foreign language with learning history and culture revealed students' development of cultural awareness and their deeper understanding of cultural diversity (Griva & Kasvikis, 2015).

THE STUDY

Rationale and the Objectives of the Project

Taking into account the aforementioned results from a number of CLIL projects both on international and national level (Admiraal et al., 2006; Griva & Kasvikis, 2015; Jäppinen, 2005; Korosidou & Griva, 2013; Lasagabaster, 2008; Lasagabaster & Sierra, 2009; Stohler, 2006; Vilkancienė, 2011; Yamano, 2013), we decided to design and implement a pilot CLIL project entitled "From Michelangelo to Picasso". It aimed at introducing History of Art, from Renaissance till present, and improving the students' competence in English as a foreign language (EFL).

The reason for having chosen that specific content was that 'Art Education' is not strongly promoted across the Greek Curriculum (Kasvikis, 2010), despite the fact that 'art' is claimed to contribute to the children's aesthetic and overall development (Chapman, 1978). Art appreciation is generally considered to be "the desired outcome of art education" (Barret, 2007) and entails the valuing the worth of a work of art through an extended and guided study that includes the "acquisition of knowledge related to the object, the artist, the materials used, the historical and stylistic setting, and the development of a critical sense" (Hurwitz & Day, 1995, 309–310, cited in Barret 2007). These elements were incorporated in the activities during the implementation of the CLIL project.

The purpose of the project "From Michelangelo to Picasso" was twofold, since an attempt was made to improve students' EFL skills and competence, and enrich their knowledge on the artistic movements from 15th to 21st century.

More specifically, the CLIL project aimed at:

- developing the students' receptive and productive skills in EFL
- improving their communicative competence in the target language by creating authentic learning environment
- enriching specific vocabulary
- familiarizing the students with and making them aware of aspects of 'art history'
- motivating them to appreciate 'art' and developing their creativity

Participants

The sample of the project consisted of twenty three 6th grade Greek speaking students (aged 11-12 years) attending an experimental primary school in Northern Greece. Seventeen of the students involved in this project were girls, while the rest six students were boys. The students' English language competency level was identified as A2+ (Elementary Level) according to the CEFR (Common European Framework of Reference for Languages).

In order to obtain information about the students and estimate their needs and preferences in FL learning and art, a needs analysis instrument was distributed to them before the implementation of the project. According to the findings, fifteen of the total number of students reported that they had been learning French and eight of them German. Some of them also claimed to speak other languages such as Italian (8 students), and Spanish (4 students). Regarding the difficulties they encounter in English, most of them reported 'grammar' (8 students) and 'vocabulary' (5 students) as highly demanding areas, while three students stated that they encountered difficulties in speaking and writing skills in EFL.

In relation to their attitude towards 'art', most of the students (19) stated that they like it very much, while only 4 of them expressed a different opinion. When they expressed their feelings about 'art', they regarded it as an interesting activity (8), aesthetically beautiful (3) and creative (3). Finally, regarding the ways they can obtain information about it, most of the participants mentioned that they could learn about art through the internet (9students) and museums (8students) or during trips (8students). A few of them (3students) reported school as a major source of getting information about it.

Design of the Project

The project was designed following five basic principles: communication – cooperation - interaction – conceptualization - creation. The design of the module "From Michelangelo to Picasso" was an attempt of an alternative educational method to respond to the potential of CLIL, within the existing national curriculum. It is a communicative oriented module aiming to make children acquire artistic knowledge as well as create and communicate in the target language. Since a *topic-based* approach was followed, the teaching module: "Western art" from 15th to 21st century consisted of ten thematic units:

- Renaissance: in this unit the students became acquainted with the most famous artists of 15th-17th century and their paintings that made a great impact on the nature of art of that period.
- Baroque, Rococo: during this unit the students elaborated on the artists of the Baroque and Rococo movements, their paintings and the artistic features that distinguished them from their predecessors.
- Neoclassicism, Romanticism: In this unit the students came in touch with these two artistic movements and elaborated on their differences and their basic characteristics.
- Realism: the specific unit was related to making children understand the underlying characteristics of Realism, such as the basic themes and the sources of inspiration of its most important artists.
- Impressionism: the unit about Impressionism focused on the painting style of this specific movement, its differences from the previous ones, its main artists and the themes of their paintings.
- Post-impressionism: in this unit the children elaborated on the four basic artists of Post-impressionism, their style and their main sources of inspiration.
- Expressionism, Fauvism: this unit focused on the main feelings of the Expressionist movement (anger, sadness, pain fear) and the sociopolitical characteristics that led to its emergence. The students also became acquainted with its main artists and their most famous paintings.
- Cubism, Abstract Art: this unit aimed at analyzing these two artistic movements. Attention was paid on their basic elements, their style, their most famous artists and some of their most characteristic paintings.
- Surrealism: the unit about Surrealism focused on the reasons that led to the emergence of the movement on the context and on the main sources of inspiration of its artists. Some of these artists and their contribution to art were also introduced to the students.
- Contemporary art: in this final unit students came in touch with the artistic movements after WWII and the current trends of art (Abstract Expressionism, Pop Art, Performance, Graffiti, Installation).

The aforementioned units were designed on the basis of Gombrich's seminal book "The Story of Art" (1995). Each intervention aimed at familiarizing the students with the historical, social and cultural factors that lead to the emergence of these artistic movements and helping them understand their contribution to the Western Art. A coherent presentation of the development of art during the last 7 centuries is not appeared in Greek Primary education as only a number of sporadic references to paintings, artists and movements of that period can be traced randomly in some of the Language, History and Visual Arts textbooks.

The 'activities' were selected to provide a structured framework for getting children actively involved in the learning process and participating in communicative activities. The need for well-designed group activities and games seemed to be of a great significance in order to create an authentic environment, where the students would use the language to achieve real life communicative goals and solve 'real life' problems. The activities were designed taking into account: a) children's interests, cognitive skills and prior knowledge, b) certain criteria for "good" language learning tasks, such as drawing objectives from learners'

communicative needs, allowing for different solutions depending on learners' skills, involving learners' contribution, being challenging, providing opportunities for target language practice (Candlin, 2009). Learning while playing is the best way to learn a language, because it creates emotional attachments and it focuses on children's participation and enjoyment in a relaxed context (Dryden & Rose, 1995; Griva & Semoglou, 2013).

More specifically, the selected activities were organized in a way that would help the students develop their:

- *language and communication skills*: through the presentation and description of their works of art, the argumentation on their points of view and the collaboration and interaction with their classmates.
- *cognitive skills*: such as critical thinking, through their participation in tasks where they would associate and compare details of various and different pieces of art.
- *cultural awareness*: by familiarizing the students with aspects of art and culture from Renaissance till present, and raise their art appreciation.

Implementation of the Project

The project was launched, in the school year 2013-2014, at an experimental primary school in Northern Greece. The interventions lasted for four months, from the beginning of February till the end of May 2014. On June 11th 2014, the students organized a 'Museum of Art', where they exhibited the paintings they created during the project.

The project consisted of 10 three-hour interventions, following the principles of task-based learning. Thus, it was carried out in a "task-based" framework (Willis, 1996), with the cooperative activities being at the core of the project, where the children were provided with opportunities for active participation and cooperation while making decisions and creating their products. The tasks were distinguished between a *macro-task* (e.g., create a painting, an art product), an *intermediary task* (e.g., 'organize a debate or a role play') and a *micro-task* (e.g., vocabulary/ specific vocabulary games)

Every intervention was performed through three phases:

Pre-Task Phase

This stage encompassed the following steps: a) introduction to the topic in a multisensory learning context (e.g., stories, ppt, video clips, films, songs), b) contextualization of the task (through pictures, realia, art evidence, etc.) c) exposure to specific language.

One of the basic objectives of the pre-task stage was the students being gradually capable of comparing pieces of work from different artistic traditions and identifying to which art movement they belong. That would lead to students' deeper understanding of similarities and differences of those art works, as well as to students' awareness of the contribution of those paintings to Art.

More precisely, a Power Point presentation was always the tool to accomplish the introduction to the topic. Furthermore, an effort was made to activate the students' background knowledge, so that they could associate the details about the different 'art movements' more easily and understand better the reasons of their emergence. Multimodal

teaching material and aids, such as videos, pictures and music, was used in order to help the students acquire the new content knowledge and stimulate whole class discussion in the target language.

Given the fact that English was used as the language of instruction and of the PP presentations, a bilingual vocabulary sheet, including the specific vocabulary of each unit, was distributed to the students. Also the sheet incorporated certain expressions the students could use when getting involved in different activities.

At the beginning, a timeline was used in order to specify the period when each one of the 'movements' took place. In that way, the students could take into account the general characteristics of that era and how those features had an impact on Art. Moreover, emphasis was placed on elaborating on the individual features of each 'movement' with special focus on asking the students to compare a painting of the artistic stream presented during that lesson with one of the previous sessions in order to be aware of their similarities and differences.

When students' awareness of the aforementioned characteristics was ensured, the most important artists of each movement were presented along with some of their most famous paintings. Both the artists and the paintings were presented in the target language (EFL) by the teacher, and the children were asked to identify certain features of the artists' technique in the paintings in the target language or code switching in L1 (first language) when encountering language difficulties.

After the completion of the presentation, whole class discussion was being held. Children were provided with the opportunity to imagine what they would paint if they were painters of that period, and to discuss about their influence by the society of that era, as well as the messages they would like to express and transmit through their artistic works they would construct in the "task cycle" phase.

Task Cycle

In this stage the teacher splitted the class into groups, who were encouraged to use the target language creatively and spontaneously through participating in a 'macro task' in groups. Those communicative tasks offered the students various chances to use the knowledge they had already acquired during the pre-stage or the previous lessons (Ruso, 2007).

The students were requested to create a painting in accordance with the artistic movement/-s presented in the pre-stage. The children, in groups, had to work together on a common task, helping each other and interacting with each other in the target language during "problem-solving" negotiation and assuming responsibility for contributing to the creative task.

After the completion of their 'products', they participated in different communicative activities, such as 'role-playing', where the children pretended to be artists of a specific artistic movement and were asked to present their paintings and/or themselves, etc. b) 'debates' between representatives of 'opposite' movements or c) 'exhibitions', where the students of a group expressed their opinion about different paintings of their classmates. Below, we present some representative communicative tasks/activities included in that stage:

Neoclassical vs. Romantic Painter

The pupils had to choose one of these movements and create a painting in accordance with its technique and the most common themes. When the paintings were completed, the

students who stranded for ‘Neoclassicism’ formed a larger group with those who stranded for ‘Romanticism’ forming another larger group. The “artists” of each group, who belonged to two larger groups representing “Neoclassicism” and Romanticism” respectively, should present their paintings and the movement they belong to, and then argue about its ‘superiority’ over the opponent movement.

Paint the Emotions

The students had to choose one of the four basic feelings (pain, fear, anger, and sadness) depicted in Expressionist paintings. Then, they had to create a painting based on that feeling, however maintaining the basic features of the specific movement. Upon the completion of the paintings, the students showed their creations to their classmates who had to guess what the depicted feeling was. Then, each “artist” had to justify the choice of the specific feeling.

Cubism or Abstract Art?

Depending on their preferences, the students should create either ‘cubist’ or ‘abstract’ paintings. Those who wished to make use of the collage technique (Cubism) could have a range of materials at their disposal (newspapers, magazines, fabrics, glue, scissors). Once they finished their paintings they had to give a title to their paintings and exhibit them to the class. Each student should choose three paintings (except his/hers of course) and write on a piece of paper the title of the painting, its creator, the movement to which he/she thinks it belonged and three words that he/she thought best characterized the creation.

Dreams Come True

The students were asked to remember one of their weirdest dreams and paint it. Upon the completion of their paintings they had to name them and present them to their classmates. Then the class voted for the most successful “Surrealist” paintings, and the students were divided in two groups. Each group was asked to write a version about the ‘history’ of the painting.

Follow Up Phase

In this stage, the teacher picked up and drew attention to relevant language and semantic points and made children recycle new vocabulary, specific vocabulary and content-knowledge by getting them involved in some micro tasks, such as games, puzzles, etc. in a game-based and relaxing environment (language focus). Different kinds of games were included, such as board games, knowledge quizzes, guessing games, games, physical activities, etc. all of them involving collaboration and interaction in the target language (Griva & Semoglou, 2013).

Furthermore, the teacher gave feedback on the content and quickly reviewed what was presented; meanwhile, the students voted and chose their preferred task. Below, we present some representative communicative tasks/activities included in that stage:

Artistic Buzz

The students were divided in two groups in order to take part in a ‘knowledge – based’ quiz. That game, presented through PowerPoint, included 18 questions related to the features of ‘Baroque’ artistic movement, its artists and their most known paintings. The students had

to listen to the question carefully, and then the team who firstly yelled “Buzz!!!” had the opportunity to answer. For every correct answer each team gained one point, but if the answer was wrong, the opponent team had the chance to talk and win the round. The group with the major number of points was the winner of the game.

Top Ten

The class was divided into four groups of six students. The teacher mentioned the name of an artist. Each group had three minutes time to think of ten words or phrases related to the specific artist. For every correct word (or phrase) each group gained a point. If one of the groups found a correct word in the target-language, and that word had not been mentioned by the other groups, then that group gained an extra point. The group with the highest amount in points was the winner of the game.

The Puzzle of Impressions

The students were divided into two groups, the ‘green’ group and the ‘blue’ one. Each group was given eight pieces of painting. Behind each piece there was a multiple choice question regarding the artistic movement of ‘Impressionism’. Each group had to find the correct answers and then to match the pieces of the puzzle. Upon the completion of the process, the students had to find the name of the painting. The winning group was the one who had given the greatest number of correct answer.

Trivial Pursuit

The class was divided in two groups. A board of 30 numbered squares was presented on the wall, through a projector, including the pawns of each group. The students were given a dice. Each group rolled the dice and moved its pawn according to the number of the dice. Then the students were asked a question related to the artistic movement of ‘Post-Impressionism’. If the answer was correct they could move their pawn two positions ahead. If the answer was wrong, they had to move their pawn two positions back. The winner was the group that arrived first at the final point.

Personating Expressionism

The class was divided in two groups. Each group appointed an opponent player to pantomime, ‘describing’ one of the paintings or artists of the ‘Expressionist’ movement. The player had to use gestures and extraverbal behavior in order to help his/her group find the painting or the artist. However, he/she could not use some words, such as the name of the artist or words included in the name of the painting. Every player had two minutes at his/her disposal, so as to accomplish his/her goal. Each group gained one point for every correct guess. The group with the major number of points was the winner of the game.

Sit First

The students were divided in two groups. Two chairs were placed in front of the blackboard. Each group picked one of its players. The two players stood in front of the chairs. Afterwards, they were asked a question regarding the artistic movement of ‘Cubism’ or ‘Abstract Art’. The player who sat first on his/her chair had the opportunity to give an answer. If the answer was correct, he/she gained a point. If the answer was wrong, the opponent

player had the chance to give the correct answer and gain the point. During each round, different players took part in it. If during the game one of the other students gave away the correct answer, then his/her group lost one point. The group that obtained the greatest number of points was the winner of the game.

Taboo

The students were divided in two groups. Each group chose one of its players. The player was given a card that included the word (or phrase) that his/her group should find out! The word was related to the artistic movements of 'Contemporary Art'. In addition, underneath this word there were three more words that the player should not mention in his/her attempt to describe the one above. Each player had one minute at his/her disposal to accomplish his/her goal. When the time ran up, a student of the opponent group was called to play. At each round the players were different. Every correct 'guess' credited a point to each team. The group with the major number of points was the winner of the game.

The Museum

Shortly after the implementation of the project, an Art Museum was organized by the students in cooperation with the teacher, where the students exhibited the paintings they had created during the interventions. A total of 220 works-products were exhibited representing the different 'artistic movements' they had known during the interventions.

The museum was open to all the visitors who wanted to attend it and honor and admire students' work. Thus, a lot of people were gathered, including students' parents and friends, as well as people who happened to pass by and wanted to watch what the children had created.

The event attracted even the interest of the local press, and some photos were published in the local newspaper.

Evaluation of the Project

In order to examine the feasibility of the project and its impact on children's language skills and content knowledge development, an estimation study was conducted by using the following tools:

a) Pre-Test/Post-Test

A Pre-test and Post-test in relation to content knowledge and target-language, which used the same components, were administered to the children individually at the beginning and after the completion of the project. The tests referred to the same skills, so that we could have the best possible information about the influence and the effectiveness of the project. They consisted of two parts: a) the first part included 15 multiple choice questions in English related to the movements, artists and paintings of the interventions. Those questions meant to identify students' knowledge about art and specific vocabulary skills before the implementation and after the completion of the project.

The second part included two open ended questions in English that the students had to answer in the target language: a) do you like art? why? b) do you like painting? What would you like to paint? This part of the test aimed at identifying the students' general and specific language skills before and after the implementation of the project.

b) Questionnaires of Satisfaction

The researchers encouraged students to feel free to answer the questions in the questionnaire distributed to them upon the completion of the project. Its purpose was to record students' attitudes towards the project identifying if it responded to their interests and expectations.

The questionnaire comprised of eight questions related to the students' views on the interventions and the contribution of the project to the improvement of FL skills and the enrichment of the content knowledge. The students were invited to express their overall experience of the project. They were asked to indicate the extent to which they liked or disliked on certain statements on a four-point Likert-type scale. Some questions included in the instrument were the following: a) what do you think of the lessons? did you like them? b) what did you like most of what we did? (presentations, painting, games, which games?), c) what didn't you like so much? d) what did you find more difficult? e) what would you like to do more during the lesson? f) did the lessons help you improve your language skills in English? g) did the lessons help you enrich your knowledge about art? h) would you like to participate in this project once again? Why?

c) Teacher's Journals

Throughout the project journals were kept by the teacher once a week in order to reflect on learning and teaching issues. It was designed and applied with the purpose to gain an in-depth understanding of the implementation and monitoring of the CLIL project, since it was regarded as a means of generating questions about teaching and the dual focused learning processes. Journals have been proved to be valuable tools for the improvement of the teaching process (Avgitidou, 2011; Baurain, 2010; Georgopoulou & Griva, 2012; Moreland, 1997; Ojanen, 1993; Qing, 2009; Richards, 1991) as they provide teachers with the opportunity to reflect on their practices, feelings and thoughts (Yinger & Clark 1981 c.i. Moreland 1997).

The questions included in the journal were divided into three main groups:

a) Questions Related to the Dual Focused Teaching Process

- What teaching methods and aids did I use during this intervention?
- Did I encounter any problems during the CLIL approach? Did something unusual happen?
- Which parts of the CLIL teaching were more successful? Which ones were not? Why?

b) Questions Related to Children's Behavior during the Project

- What did the students like/dislike?
- What did the students find most difficult?

c) Questions Related to the Teacher's/Researcher's Reflection on the Project

- If I had the chance to teach the same thematic unit again, what changes would I make?
- Did the lesson achieve the goals that were set in advance?

RESULTS

Pre/Post-Test Measurements

The mean scores of the students' performance during the multiple choice part of the Pre/Post-test measurements suggest a strong effect of the project on their knowledge about 'art' and 'history of art', since most of them showed a significant progress between the two measurements. The paired-samples t-test indicated that there were statistically significant differences between the two tests ($t = 8.6$, $df = 22$, $p = 0.000 < 0.05$). Specifically, the participants increased significantly the number of their correct answers during the Post-test. Table 1 shows the mean score and standard deviation in the students' correct answers during the pre- and post-test.

The following table (table 2) shows the number of correct answers per student, in the pre/post measurements.

Table 1. Mean score and standard deviation during pre-test and post-test

Mean	Pre-test	Post-test
	8	12,26
Std. Deviation	1,76	2,44

Table 2. Students' performance during pre-test and post-test

Students	Correct Answers Pre-test	Correct Answers Post-test	Performance Difference
Student 1	10	14	+26,7%
Student 2	5	10	+33,3%
Student 3	7	14	+46,7%
Student 4	9	13	+26,6%
Student 5	10	13	+20%
Student 6	10	14	+26,7%
Student 7	7	9	+13,4%
Student 8	9	12	+20%
Student 9	5	5	0%
Student 10	9	14	+33,3%
Student 11	11	14	+20%
Student 12	6	13	+46,6%
Student 13	9	8	-6,7%
Student 14	9	10	+6,6%
Student 15	7	14	+46,7%
Student 16	9	14	+33,3%
Student 17	10	12	+13,4%
Student 18	6	12	+40%
Student 19	6	14	+53,3%
Student 20	8	13	+33,3%
Student 21	8	14	+40%
Student 22	8	15	+46,7%
Student 23	6	11	+33,3%
Mean	8	12,26	+28,4%

As abovementioned, the second part of the pre/post-test included two open ended questions in English that the students had to answer in the target language: a) do you like art? why? b) do you like painting? What would you like to paint? This part of the test aimed at identifying the students' specific vocabulary before and after the implementation of the project.

It was revealed that there was a significant difference in the students' specific vocabulary between the two measurements. Table 3 shows the mean score of the specific vocabulary used by the students in the pre- and post-measurement.

The paired-samples t-test showed that there were no statistically significant differences in the number of specific words between the two tests with regards to the first question («*Do you like art? Why?*») ($t = 0.81$, $df = 22$, $p = 0.426 > 0.05$). Consequently, the mean score of specific words used by the students in the first question was not increased significantly.

Concerning the second question («*Do you like painting? What do you like to paint?*») the paired-samples t-test indicated that there was statistically significant difference in the number of content words used by the students between the two tests ($t = 2.92$, $df = 22$, $p = 0.008 < 0.01$), since the students increased significantly the number of content words in their answers during the post test.

The most common content words (specific vocabulary) in the students' answers were: landscapes (11 occurrences), portraits (8 occurrences), everyday life scenes (6 occurrences), still lifes (6 occurrences), self-portraits (6 occurrences), graffiti (3 occurrences), abstract art (3 occurrences) and theme (3 occurrences). At this point it must be highlighted that the aforementioned occurrences refer to the appearance of each one of the content words and not to the frequency of their appearance. Thus, though a student may have used the same word more than once, the word was still counted once.

Table 3. Mean score of content words in the pre-test and the post-test

	Pre-test		Post-test	
	Question 1	Question 2	Question 1	Question 2
Mean	1,13	1,30	1,22	2,43

Questionnaire of Satisfaction

The qualitative and quantitative analysis of the questionnaires of satisfaction data, revealed a generally positive attitude towards the CLIL project.

More precisely, most of the students ($N = 21$) stated that they liked the lessons very much, while only two of them were not much impressed by them. Concerning their favorite activities, the majority of the participants declared that they mostly liked the painting activities ($N = 21$) and the tasks/games ($N = 11$) been involved during the 'Task-cycle' and the 'follow up' phase.

The most difficult parts of the teaching sessions, according to the majority of the participants, were the acquisition of new content-specific information ($N = 5$), the painting activities ($N = 4$) and the comprehension of PowerPoint presentations ($N = 3$). With reference to the activities that the students would like to get involved more frequently during the

lessons, the majority stated that they would like to do more painting (N = 16) and play more games (N = 5).

		<i>iv. developing content specific knowledge</i>
		<i>v. pleasurable learning</i>

Moreover, most of them reported that the CLIL project contributed a lot to the improvement of their language skills and specific vocabulary (N = 12) and the enrichment of their content-based knowledge (N = 22).

Finally, all students stated that they would like to participate in such a CLIL project in the next school year, because they found this experience outstanding and enjoyable (N = 15), they learned a lot of things about 'art' (N = 5) and they improved their language skills in the target language (N = 4).

Teacher's Journals

The qualitative analysis of the journal entries led to the creation of four typologies in order for similar categories and subcategories to be classified. Those typologies were: a) teaching procedure, b) teacher's role, c) student's behavior and d) overall reflection on the project (Table 4).

The analysis of the journal entries revealed a variety of teaching methods and practices used during the CLIL interventions. Multisensory learning, drawing, games, ICT, interactive and inquiry-based activities led to the creation of a supportive and entertaining learning environment, where the students felt free to express themselves and to be creative. The activities of the 'task cycle' and the 'follow up' phase proved to be more successful and effective compared to the activities in the "pre-task phase". The teacher tried to coordinate students' cooperation and interaction in every phase of the interventions, by encouraging the children to participate actively in the activities and offering them guidance whenever they needed help and support.

The students appeared to find the project enjoyable, as they felt very excited and participated actively in a game-based and creative context. The problems that they encountered concerned their receptive and productive skills, since in some occasions they found it difficult to understand and use the specific vocabulary and certain concepts. At some points, they switched to their mother tongue in order to clarify their viewpoints, but, overall, they improved their content-specific knowledge and enhanced their cognitive and language skills.

DISCUSSION AND CONCLUDING REMARKS

The paper presents the design, implementation and evaluation of a pilot CLIL project, which aimed at improving the students' productive and receptive skills in the target-language and enriching their knowledge on 'art' and 'history of art'. Every intervention was carried out in a game-based context and followed the principles of task-based learning, so that the classroom environment would promote students' communication, cooperation, interaction, conceptualization and creation. The data collected before, during and after the completion of the interventions revealed that the CLIL project had a positive impact on the target-language (EFL) and the content knowledge, History of Art which is a field that comes up only occasionally in the Greek Curriculum of Primary Education. Through their involvement in the CLIL project, the students had the chance to being familiarized with new content knowledge

in an alternative way, beyond the traditional, 'departmentalized' instruction of the school subjects (see Jäppinen 2005). Moreover, an authentic environment was created, where the students could acquire new content knowledge in an authentic context and use the target language to achieve real life communicative goals and solve 'real life' problems (Lasagabaster & Sierra, 2009).

Specifically, as far as the target language is concerned, the data indicated significant improvement in relation to the children's receptive and productive skills. As the project moved on, the participants were enhancing their communicative skills and were enriching the general and specific vocabulary, as well as they were more flexible in transferring the new content knowledge to other situations. These results coincide with the findings of previous studies, in which CLIL learners performed at above-normal levels in both receptive and productive skills in the target language (Dalton-Puffer, 2008; Korosidou & Griva, 2013; Papadopoulos & Griva, 2014; Sánchez Pérez & Salaberri Ramiro, 2013).

Concerning the content-knowledge, it was revealed that the students seemed to have improved significantly their knowledge in relation to identifying aspects of 'art' and 'history of art' and distinguishing certain features of various artistic movements, artists and paintings, and thus they enhanced their appreciation of art. The findings are in line with previous extensive research findings on CLIL approach (Gimeno et al., 2010; Griva & Kasvikis, 2015; Kiraz et al., 2010; Mattheoudakis, Alexiou & Laskaridou, 2014; Papadopoulos & Griva, 2014; Popescu, 2008).

Moreover, the children seemed to consider CLIL approach as an extremely pleasant process, and they stated that they would like take part in such a project during the following school year. Their active participation and interaction, as well as their enthusiasm and their effort to achieve a better performance both in language and content were recorded in the journal entries. Moreover, it was revealed that the students expressed particular pleasure and enjoyment about the most creative part of every teaching session, such as the painting activities, and the collaborative games.

In conclusion, besides the limited number of sessions and the small sample size, the experimental CLIL project was successful in enhancing both primary school students' FL skills and content knowledge. As a result, the specific project could be implemented in several primary school classrooms throughout a longer period of time in order to depict a broader and more complete picture of its effectiveness in the future.

Chapter 49

NEW DEVELOPMENTS IN LEXICAL INFERENCING AND INCIDENTAL VOCABULARY ACQUISITION IN FOREIGN LANGUAGE LEARNING

Feifei Han*

E-Learning, the University of Sydney, Australia

ABSTRACT

Lexical inferencing strategies are important cognitive strategy not only for obtaining good level of reading comprehension but also an effective learning strategy in vocabulary acquisition (Barnett, 1990; Schmitt, 1997). Closely related to lexical inferencing strategies is incidental vocabulary acquisition, the latter is seen as an essential prerequisite for the latter, and the latter is viewed as one of the products of lexical inferencing strategies. This chapter systematically and critically reviews a variety of factors which influence lexical inferencing strategy use and incidental vocabulary acquisition among foreign language (FL) learners. The chapter concludes with some directions for researchers to consider in the future research.

INTRODUCTION

Lexical inferencing, as a paramount cognitive strategy (O'Malley & Chamot, 1990; Oxford, 1990), is one of the most effective learning strategies not only in reading comprehension but also in vocabulary acquisition (Barnett, 1990; Schmitt, 1997). Another concept which is closely related to lexical inferencing is incidental vocabulary acquisition, which is always viewed as one of the products of using lexical inferencing strategies in reading (Fujiwara, 2004). This chapter first offers a comprehensive definition of lexical

* Corresponding Author Email: Feifei.Han@sydney.edu.au; joy_hanfei@hotmail.com. (Room 310, Level 3, Building G12, The University of Sydney, Sydney, NSW, Australia, 2006).

inferencing, it then systematically review lexical inferencing studies in foreign language reading. Then the definition of incidental vocabulary acquisition and studies on incidental vocabulary acquisition through reading are critical reviewed. In the end, it points out directions for future research in lexical inferencing and incidental vocabulary acquisition research.

DEFINITION OF LEXICAL INFERENCING

Lexical inferencing is a type strategy, which makes informed guesses as to the meaning of unknown words using different kinds of resources (Bengeleil & Paribakht, 2004; de Bot, Paribakht, & Wesche, 1997; Fraser, 1999; Haastrup, 1991; Kuhn & Stahl, 1998; Nassaji, 2003; Oxford & Scarcella, 1994; Paribakht & Wesche, 1999). According to Haastrup (1991), the available resources involve: “all available linguistic cues and in combinations with general knowledge of the world, awareness of the context and relevant linguistic knowledge” (p. 40). Deschambault (2012) describes lexical inferencing as “among the most common techniques that L2 learners use to generate meaning for unknown words they encounter in context” (p. 266). Past research has indeed confirmed that FL learners infer the meanings of unknown words more often than looking them up in a dictionary (Hulstijn, Hollander, & Greidanus, 1996; Schmitt, 1997). The correctly guessed words can be integrated into learners’ existing vocabulary knowledge, and hence result in acquiring new vocabulary incidentally through reading, which is termed as incidental vocabulary acquisition (Hamada, 2005; Pulido, 2004, 2009).

In order to infer the meaning of words, a reader needs to notice that the written form of a particular word is unknown and to be alerted that a gap of the word exists in his/her mental lexicon. This initial gap noticing is known as “lexical bootstrapping”, which occurs concurrently with other reading processes in a reader’s working memory (Clark, 1993; de Bot et al., 1997; Nassaji, 2003; Pulido, 2009; Sternberg, 1987). The reader may attempt to derive the meaning of the word by analysing the word’s internal structure; by using contextual cues; by inferring using some extralinguistic knowledge, such as world knowledge, or by orchestrating some or all of these sources. During this process, the activated multiple cues are held in working memory in order to generate an appropriate meaning of the unknown word. Lexical inferencing is considered to be a crucial step necessitating successful incidental vocabulary acquisition to occur (de Bot et al., 1997; Fraser, 1999; Huckin & Coady, 1999; Paribakht, 2005; Paribakht & Wesche, 1999). As lexical inferencing is considered not only as an important reading strategy; but also a prerequisite for incidental vocabulary acquisition through reading, thus lexical inferencing research has been carried out in both reading and vocabulary acquisition domains.

In FL lexical inferencing research, existing studies have probed into a variety of factors, including characteristics of learners and reading texts, as well as characteristics of the target words on learners’ behaviours in lexical inferencing. In terms of learner characteristics, previous studies have demonstrated that attention to detail in context affects their ability to use context effectively in guessing lexical inferencing (Frantzen, 2003).

EMPIRICAL STUDIES ON LEXICAL INFERENCING IN READING

In the literature of FL reading, it is common practice to research lexical inferencing by instructing readers to apply lexical inferencing to guess meaning highlighted target words without necessarily reporting other reading strategies (Deschambault, 2012; Nagy, Anderson, & Herman, 1987); and most lexical inferencing studies are related more closely to vocabulary acquisition rather than reading.

Most previous studies on lexical inferencing have either deliberately directed learners' attention to figuring out the meaning of highlighted new words in reading, or have modified contexts in which new words appear with explicit definitions or ample exemplars in order to make them more informative than normal reading texts (Nagy et al., 1987; Gipe, 1979). For instance, some researchers have purposefully constructed a fabricated text by placing a pseudoword in between every 50 words across the text (e.g., Ames, 1966). By doing such things, either unnatural reading situations are created or reading texts are distorted. Because readers are forced to infer every target word, such practices are not able to reflect a natural situation in which a reader comes across a new word in reading. Nagy et al. (1987) critiqued these research designs, suggesting that what a reader can do "under this special arrangement tells us very little about how likely a person is to figure out and remember the meanings of unfamiliar words during normal reading" (p. 238).

Studies of lexical inferencing in L1 reading with native English speaking children have been extensive. These studies have revealed that children are capable of deriving meaning of unknown words from context (e.g., Cain, Oakhill, & Elbro, 2003; Nagy, Herman, & Anderson, 1985). These studies have shown that children's characteristics, such as their age (e.g., van Daalen-Kapteijns, & Elshout-Mohr, 1981), intelligence (e.g., Sternberg & Powell, 1983), reading proficiency (Cain, et al., 2003), existing vocabulary knowledge (e.g., Sternberg & Powell, 1983), ability to analyse word structure (Shu & Anderson, 1997), and working memory (e.g., Daneman & Green, 1986), all have an impact on children's lexical inferencing ability. For instance, Cain et al. (2003) manipulated the distance between target words and the contextual information for deriving definition of the target words in short stories to see whether levels of reading proficiency could impact the ability to obtain the meaning of the target words. The results demonstrated that less skilled readers performed worse on meaning generation of the target words, especially in situations in which the distance between the novel words and the contextual information was further away.

In addition to children's characteristics, L1 lexical inferencing studies have also examined the influence of properties of target words and contexts where the target words are surrounded on children's lexical inferencing success. These studies have found that low frequency words (e.g., Graham & Watts, 1990), words with low imaginability and concreteness (e.g., Fukink, Blok, & de Glopper, 2001; McFalls, Schwanenflugel, & Stahl, 1996; Sternberg & Powell, 1983), words which entail difficult concepts and words which have non-transparent morphological cues (e.g., Shu & Anderson, 1997), tend to hamper children's success in deriving the meaning.

In FL lexical inferencing research, existing studies have probed into a variety of factors, including characteristics of learners and reading texts, as well as characteristics of the target words on learners' behaviours in lexical inferencing. In terms of learner characteristics, previous studies have demonstrated that attention to detail in context affects their ability to

use context effectively in guessing lexical inferencing (Frantzen, 2003). In a study with native English speaking teenagers acquiring Spanish, Frantzen (2003) reported that her readers often showed ignorance of details in the context, which had the potential to reveal the correct meaning of the new words. The learners' inattentiveness often prevented them checking their initial inferences, even though the context did not support these guesses. She found that "inattention occurs not only when reading difficult passages, where it is more understandable, but also in easier contexts" (p. 184). Therefore, she suggested from a pedagogical view, learners needed to be instructed on re-evaluation strategies of the initial guess against contextual information.

Learners' language proficiency is another factor that influences lexical inferencing behaviours. With two groups of Danish EFL teenagers differing in English proficiency, Haastrup (1991) found that the higher proficiency group used more intralingual cues (i.e., linguistic cues of the target words and syntactic structure of sentences) than the lower proficiency group, which led the author to claim that there seems to be a threshold of language proficiency for certain lexical inferencing strategies to be applied. In another study, Chern (1993) found that among Chinese EFL learners, the less proficient learners relied more on local cues than their higher proficient counterparts to guess unknown words in reading English expositions. Even though these studies have shown distinct lexical inferencing behaviours in terms of using sources to generate inferences according to proficiency level, language proficiency may not affect success in lexical inferencing. For instance, Bensoussan and Laufer (1984) compared the success of lexical inferencing among good, average, and weak EFL learners at the beginning level. The learners were given an expository text to read and asked to use lexical inferencing strategies, however, no significant relationship was found between proficiency and number of corrected guessed words.

Apart from the influence of general language proficiency, there is a suggestion that FL reading proficiency also affects lexical inferencing behaviours, including frequency of attempts to infer words and ease of integrating information from multiple sources in lexical inferencing. Previous studies have reported that more skilled readers tend to make more attempts to infer than less skilled ones (e.g., Fraser, 1999); on the other hand, less proficient readers encountered more difficulties in combining different sources in lexical inferencing (e.g., Schouten-van Parreren, 1989).

Learners' existing vocabulary knowledge is also a crucial element for successful lexical inferencing to occur. When words surrounding the target words are unknown, it considerably limits chances for learners to disambiguate the target words (Huckin & Coady, 1999). Levels of vocabulary knowledge do not only lead to differences in lexical inferencing strategy use, but also generate different rates of successful inference. Among 21 ESL learners from a variety of language backgrounds, Nassaji (2003) found those who performed well in the Word-Associate Test (Read, 1993) in terms of depth of vocabulary knowledge used certain lexical inferencing strategies more frequently and effectively. A multiple regression analysis revealed that depth of vocabulary knowledge was an additional predictor of lexical inferencing success over frequency of lexical inferencing strategy use.

With regard to characteristics of reading texts, the difficulty level of texts has been shown to influence inferencing behaviours and subsequent success of lexical inferencing. Frantzen (2003) maintained that a difficult text may demotivate learners from processing contextual clues; and when the difficulty level is beyond learners' ability, it often deprives the availability of contextual cues to be used in lexical inferencing. One of the indicators of text

difficulty has been measured by using new word density in a text. To investigate the impact of the density of unknown words on lexical inferencing success, Na and Nation (1985) varied the density of new words in two expositions which embedded a number of pseudowords as target words. Each exposition had two versions, namely a high-density (1 in 10) and a low-density (1 in 25). The participants were allocated the high-density texts first and were required to provide their inferences followed by reading and making inferences for the low-density texts. The study did not find a conclusive result as to whether the density of new words affected lexical inferencing. The results showed that for one exposition, the low-density version facilitated lexical inferencing, but the positive results were not replicated in another low-density exposition. Despite the inconsistent results, the study also suffered from methodological design. The facilitative effect of the low-density version could be partially attributable to the order of reading: since the low-density versions followed the initial reading of the high-density versions, from which it was highly possible to generate a reasonable level of understanding of the text. The initial comprehension could have been helpful in subsequent lexical inferencing in reading low-density expositions.

Levels of contextual cues for lexical inferencing have also been examined and studies have collectively revealed that rich contextual cues tend to generate superior inference and better retention of inference (e.g., Li, 1988; Mondria & Wit-de Boer, 1991). Li (1988) investigated lexical inferencing and retention of new words in sentences by varying contextual cues. The results showed that learners reported that contextually rich sentences made lexical inferencing easier. He also found that contextual richness tended to lead to more accurate inference, and hence resulted in better retention after inferencing compared to contextually poor sentences. The correlation between the success of word inference and subsequent learning measures was as high as .90. Likewise, Mondria and Wit-de Boer (1991) also found words in rich contextual information were comparatively easier to infer, and were more likely to be inferred correctly. Contrary to Li's (1988) results, however, they reported that rich information did not yield better acquisition after inferencing, and they explained that easily guessed words required less effort and were processed only superficially, which might "hamper imprinting" of the words (p. 262).

With regard to characteristics of target words, less research has been focused on this area. One example is the study by Paribakht (2005). Paribakht (2005) was interested in whether different lexicalization of the concepts (i.e., whether a target word in FL has an equivalent concept in L1) between L1 and FL of the target words could affect types of lexical inferencing, knowledge sources of lexical inferencing, and rate of success. With 20 Farsi speaking EFL learners, he found that even though the pattern of lexicalization did not influence types of strategies and knowledge sources, lexicalised target words which meant the words' concepts could be found in L1, significantly generated more successful inference than non-lexicalised target words (Paribakht, 2005).

DEFINITION OF INCIDENTAL VOCABULARY ACQUISITION THROUGH READING

Incidental vocabulary acquisition through reading is one of the products of using lexical inferencing strategies in reading (Fujiwara, 2004). The notion of incidental vocabulary

acquisition comes from research on native English speaking children's vocabulary development. Research has shown that on average children can learn around 3,000 to 5,000 words annually through grade 3 to grade 12 (Anderson & Freebody, 1981; Nagy & Anderson, 1984; Nagy et al., 1987; White, Power, & White, 1989). Among these words, less than 10.00% (around 200 to 300 words) are learned through direct instruction (Durkin, 1979). Considering that only limited class time is available for teaching vocabulary, children must have acquired a significant proportion of new vocabulary incidentally through activities like reading and listening (Nagy & Anderson, 1984). This kind of vocabulary acquisition is called "incidental", as word acquisition is a non-target activity but rather a by-product resulting from other activities (Coady, 1997; Fujiwara, 2004; Hamada, 2005). The predominant activity through which incidental vocabulary acquisition occurs is reading, as visual information lends itself better to word acquisition compared to audio information (Huckin & Coady, 1999).

A common practice for researching incidental vocabulary acquisition through reading is to ask learners to read a text containing a number of unknown words, and after reading learners are tested on the spelling and attributes (e.g., meaning, part of speech, and usage) of these words without knowing beforehand they will be tested (Fukkink et al., 2001; Nagy et al., 1987; Swanborn & de Gloppe, 1999).

EMPIRICAL STUDIES ON INCIDENTAL VOCABULARY ACQUISITION THROUGH READING

Researchers have regarded incidental vocabulary acquisition as an important source for children to expand their vocabulary (Fukkink et al., 2001; Nagy & Anderson, 1984; Nagy et al., 1987). Nagy and Herman (1987), for example, argued that native English speaking children learn the vast majority of words through deriving meaning of unknown words in their extensive reading. Nagy et al. (1985) also maintained that "incidental learning from context during free reading is the major mode of vocabulary acquisition during the school years" (p. 234). They further examined the rate of incidental vocabulary acquisition through reading by children, and found that the probability of acquiring a word incidentally through reading is around between 15% and 22% (Nagy et al., 1985). This percentage increases if the words are repeatedly exposed to children (Stahl & Nagy, 2006).

Incidental vocabulary acquisition needs to be distinguished from lexical inferencing, though the latter is a central cognitive process in the former (Fujiwara, 2004). Lexical inferencing is only a necessary but not sufficient skill in successful incidental vocabulary acquisition through reading (Pulido, 2003, 2004, 2007, 2009), which comprises both lexical inferencing ability and subsequent memorization of the form of the inferred word and of the mapping between the form and the inferred meaning (Fukkink et al., 2001).

L1 incidental vocabulary acquisition studies have examined the impact of various characteristics of children on their success of acquiring new words incidentally from reading. These studies have generally agreed that students' incidental vocabulary acquisition seems not to be influenced by their grade level (e.g., Nagy et al., 1987; Shu, Anderson, & Zhang, 1995). However, inconsistent results have been observed as to the effect of children's ability (e.g., Nagy et al., 1987; Shu et al., 1995; Sternberg & Powell, 1983), their existing vocabulary knowledge (e.g., Daneman & Green, 1986; Nagy et al., 1987), and their reading proficiency

(e.g., Herman, Anderson, Pearson, & Nagy, 1987; Nagy et al., 1985, 1987) on incidental vocabulary acquisition.

Besides learners' characteristics, researchers have also postulated that characteristics of target words, such as familiarity of concepts and degrees of morphological transparency of target words, would play a role in children's incidental vocabulary acquisition through reading (White et al., 1989). From empirical studies, a conclusion has been made that it is very hard for children to incidentally acquire a new word whose concept is unfamiliar to them just by a single encounter during reading (Shu et al., 1995). However, inconsistent results have been observed with regard to whether morphological transparency of target words affects success of incidental vocabulary acquisition through reading (e.g., Nagy et al., 1987; Shu et al., 1995).

Similar to what has been done in L1 incidental vocabulary acquisition, researchers have explored the influence of roles of readers, and characteristics of reading texts and target words on incidental vocabulary acquisition success in FL reading. Existing research has shown that reader factors, including readers' reading proficiency, vocabulary knowledge, and background knowledge of reading topics, all affect incidental vocabulary acquisition (e.g., Bengelil & Paribakht, 2004; Haastrup, 1991; Itzész, 1991; Morrison, 1996). In a series of studies with English speakers learning Spanish as a FL, Pulido (2003, 2004, 2007) consistently observed that regardless of the familiarity of the topics they read, FL reading proficiency as measured by a standardized Spanish reading test showed a significant and positive effect on both incidental vocabulary acquisition and retention. The magnitude of the correlations between text reading comprehension appeared to be slightly larger than those between reading proficiency acquisition and retention. With a different population, Rott (1997) found that correlations between text comprehension and incidental vocabulary acquisition and retention were moderate to strong among English speakers learning German as a FL. Not only FL reading proficiency, but L1 reading proficiency too, is able to predict incidental vocabulary acquisition. A study with Taiwanese EFL learners showed that L1 reading proficiency could explain around 8% of variance in incidental vocabulary acquisition (Haynes & Carr, 1990).

Learners' levels of existing vocabulary knowledge have been found to affect incidental vocabulary acquisition through reading. Both general vocabulary knowledge and knowledge of specific words in reading texts in which target words are embedded (known as passage sight vocabulary knowledge) are related to incidental vocabulary acquisition (e.g., Haynes, 1989; Haynes & Baker, 1993; Horst, Cobb, & Meara, 1998; Pulido, 2003, 2004, 2007, 2009). In two related studies, Haynes (1989) and Haynes and Baker (1993) tested the role of general FL vocabulary knowledge on learners' incidental vocabulary acquisition through reading an exposition among advanced Chinese EFL learners. Vocabulary knowledge was measured by a sentence completion task, and incidental acquisition was tested using a supply-definition test. A moderate positive correlation between the two was produced ($r = .62$). However, the sentence completion test was not a standardized test and this may have affected the reliability of testing vocabulary knowledge. Using a more reliable task to measure learners' vocabulary size by the Vocabulary Levels Test (Nation, 1990), Horst et al. (1998) also found moderate correlation between vocabulary knowledge at 2000 frequency level and incidental acquisition of new words through reading a simplified novel. Besides general vocabulary knowledge, Pulido (2003, 2004, 2007, 2009) consistently found that passage sight vocabulary knowledge

is a significant predictor of incidental vocabulary acquisition and retention after 4 weeks' initial acquisition.

Readers' topic knowledge of a reading text was also examined by Pulido (2003, 2004, 2007) in the above studies. The results demonstrated that even though familiarity of topics did not affect incidental vocabulary acquisition measured by a meaning production task, the familiar texts resulted in acquiring more target words measured by a meaning recognition task. These results were understandable, as meaning production for measuring incidental vocabulary acquisition was too demanding and a floor level was observed in the participants' performance (Pulido, 2003, 2004, 2007). These studies also provide a methodological basis for using a recognition task to measure incidental vocabulary acquisition.

In terms of the textual factor, studies have found that textual modification affects incidental vocabulary acquisition. In a few studies, reading texts were either simplified or elaborated, and incidental vocabulary acquisition was compared among baseline, simplified, and elaborated texts. The results consistently indicated that both simplified and elaborated texts were more prone to vocabulary gains in incidental acquisition than baseline texts (e.g., Silva, 2000).

Characteristics of target words have also been found to relate to incidental vocabulary acquisition, including types of words (e.g., Vidal, 2010), structure of words (e.g., Vidal, 2010), and lexicalization of words (e.g., Chen & Truscott, 2010). Vidal (2010) examined incidental vocabulary acquisition and retention of different types of words, namely technical, academic, and low frequency words, through reading academic texts; and he also examined the impact of different word structures: cognates, morphologically predictable words, and false cognates, on acquisition and retention of new words incidentally. Vidal (2010) found types of words could explain about 20% of variance of incidental acquisition, with the best gain by technical words followed by low frequency and academic words, which had the least gain. The researcher suggested superior acquisition of technical words was due to their relevance to understanding the gist of the academic texts. Although contrary to expectation, academic words produced the worst results, the researcher pointed out that the academic words were not salient enough for learners to pay attention to. The word structure variable made an even higher contribution of almost 40% of the variance for incidental acquisition. Among words with different structures, the learners had a similar level gain for cognates and morphologically predictable words, but learned significant false cognates.

The effects of lexicalization of target words on incidental vocabulary acquisition were examined by Chen and Truscott (2010). With 72 Taiwanese EFL learners, Chen and Truscott (2010) examined a number of repetitions of exposure and lexicalization patterns of target words on incidental vocabulary acquisition. They found that non-lexicalized words, referred to as words without equivalent concepts in L1, were learnt much worse compared to lexicalized items. Even when non-lexicalized words were repeatedly exposed to the learners as high as 7 times during reading, these words were still not successfully acquired. Such finding seems to be in line with L1 studies, which have found difficulties for children acquiring a new word incidentally when its concept is unknown to them (Nagy et al., 1987; Shu et al., 1995).

FUTURE DIRECTIONS OF LEXICAL INFERENCING AND INCIDENTAL VOCABULARY ACQUISITION THROUGH READING IN FOREIGN LANGUAGE LEARNING

The review of existing lexical inferencing studies and incidental vocabulary acquisition studies provides three avenues which warrant further exploration. Firstly, lexical inferencing should be researched in a more natural reading situation in which the target words should not be highlighted and learners should not be informed that they must apply lexical inferencing to guess the meaning of these words. A better methodology to obtain lexical inferencing information than previous studies is to examine readers' lexical inferencing without marking target words, and without telling them that they have to infer the target words. Rather, it is up to readers to make decisions as to whether it is necessary to make an informed guess of what they think needs to be inferred.

Secondly, as lexical inferencing is considered to be a common reading strategy, which belongs to higher-level processes in reading; it is likely that lexical inferencing strategies may be affected by learners' lower-level processing efficiency, such as word recognition efficiency, and sub-lexical processing (e.g., phonological and orthographical processing). Similarly, word recognition efficiency, and sub-lexical processing (e.g., phonological and orthographical processing) may also affect intentional vocabulary acquisition through reading, this is because a learner's ability to extract phonological information from print is "a vital component in learning and remembering new words" (Hamada & Koda, 2008, p. 515). Quick and efficacious capacity for converting graphic symbols into corresponding sounds may facilitate the newly obtained information (e.g., sounds and/or spelling of a new word) being integrated into working memory (Hamada & Koda, 2008). Fast and effort-free word recognition of existing words may enable readers' working memory to be freed up so that it can be used in processes of successful incidental vocabulary learning, including noticing, inferring, and integrating of the to be learnt words into one's existing mental lexicon (Hamada & Koda, 2010; Pulido, 2004, 2009). In a recent study, Han (2014) reported that lexical access inefficiency could inhibit incidental vocabulary acquisition among Chinese learners of English. However, Hamada and Koda (2010) did not find word decoding efficiency influenced incidental vocabulary acquisition during reading. As little research has been done in this area, more studies with a variety of learners backgrounds are needed to examine the relationship between word recognition and vocabulary acquisition in the future.

Thirdly, past research has investigated a variety of learners' characteristics in relation to lexical inferencing and incidental vocabulary acquisition, such as language proficiency, reading proficiency, and vocabulary knowledge. Considering both reading and incidental vocabulary acquisition place requirements on readers' cognitive capacity, it is possible that different levels of different capacities of working memory affect use of lexical inferencing strategies and incidental vocabulary acquisition through reading for FL readers. In the future researchers may consider investigating the relationship between learners' working memory capacity, and use of lexical inferencing strategies and incidental vocabulary acquisition through reading.

Chapter 50

NEW LITERACIES: CURRENT PERSPECTIVES ON TEACHING ENGLISH AS A FOREIGN LANGUAGE

Andréa Machado de Almeida Mattos

Federal University of Minas Gerais, Belo Horizonte, MG, Brazil

ABSTRACT

The New Literacy Studies encompass a notion of language as a social practice and the understanding that it is necessary to foster the development of critical thinking in citizens/students, aiming at citizenship education and social change. This chapter aims to introduce the theories of New Literacies and Critical Literacy and their relevance to research in the field of Teaching English as a Foreign Language (TEFL) and Teacher Education. The chapter presents and discusses a group of recent theories that serve as the theoretical basis for a possible epistemological change in Teaching English as a Foreign Language, especially in public schools. The chapter starts by presenting Literacy Studies and how the concept of Literacy has changed lately and goes on to discuss the New Literacies Studies (Baynham; Prinsloo, 2009; Larson; Marsh, 2005; Street, 1984) and Multiliteracies (Cope; Kalantzis, 2000). The well-known autonomous and ideological models of literacy (Street, 1984) are also presented and discussed in the chapter. Throughout the chapter, some examples to the fields of English as a Foreign Language (EFL) and Language Teacher Education are also presented and implications to research and practice in these areas are discussed. The chapter takes the perspective of EFL teaching in Brazil, where the research was conducted.

Keywords: new literacies, teaching English as a Foreign Language, teacher education

INTRODUCTION

The field of teaching English as a Foreign Language (EFL) in Brazil is currently undergoing major changes, especially due to the imperative of the new technologies, the

processes of globalization, and the influence of recent official documents, such as the Curriculum Guidelines for High School Teaching – Foreign Languages (Brazil, 2006). Our current Western society is becoming highly literate and technologized (Lankshear & Knobel, 2003), as technology turns to be almost ubiquitous in our lives, as well as in Education (Kalantzis & Cope, 2010). At the same time, the processes of globalization have brought exponential change to society in general, also influencing Education and, therefore, the Teaching of English as a Foreign Language (TEFL) and Language Teacher Education (LTE), specifically. In this context, theories about new literacies have come to play an important role as a new trend for teaching EFL in regular schools in Brazil, following suggestions from the Curriculum Guidelines for High School Teaching (Brazil, 2006). The theories of New Literacies encompass a notion of language as a social practice and an understanding that it is necessary to foster the development of critical thinking in citizens/students, allowing them to question, analyze and challenge the existing power relations, in order to bring about social change. This chapter is aimed at introducing the theories of New Literacies and its relevance to research in the fields of TEFL and LTE. To this purpose, the chapter presents and discusses a set of recent theories that serve as the theoretical basis for a possible epistemological change in teaching foreign languages, especially in public school settings. Understanding them more deeply and clarifying their concepts and characteristics may help teachers in pre-service or in-service education, and even teacher educators, who find themselves bombarded by numerous methodological proposals (Jordão, Mattos & Gattolin, 2011) and different federal, state and municipal public policies (Duboc, 2011; Maciel, 2011), which often flood the school system and daunt practitioners and students alike.

THE NOTION OF LITERACY AND ITS DEVELOPMENTS

Soares (1998) establishes an important distinction between the concepts of alphabetization and literacy. For the author, “alphabetization means to teach [someone] to read (and write)” (p. 16), whereas literacy is “the result of the action of teaching or learning to read and write: the state or condition that a social group or an individual acquires as a result of having appropriated the writing system” (p. 18). Therefore, literacy processes go beyond the traditional concept of alphabetization understood narrowly as the ability to decode the writing system. Rojo (2002) states that “reading involves various procedures and capacities (perceptual, praxic, cognitive, affective, social, discursive, linguistic), all dependent on the situation and reading purposes” (p. 32), which are usually defined by localized practices and (re)produced socio-historically. The concept of literacy, thus, is now expanded and has come to encompass social practices of reading and writing (Mattos, 2011).

Several authors nowadays discuss the concept of literacy from different points of view and offer varied definitions. Street (1984), for example, uses the term “‘literacy’ as a shorthand for the social practices and conceptions of reading and writing” (p. 1). Lemke (1998) generally defines literacy “as a set of cultural competences for making socially recognizable meanings by the use of particular material technologies” (p. 1). Norton (2007), in turn, states that the “dominant conception of literacy among governments, policy-makers, and many members of the general public is that literacy references the ability, on the part of individuals, to read and write” (p. 6). The author does not advocate this view, but claims that

it is still useful and important. Lankshear, Snyder and Green (2000) adopt Street's definition cited above, but note that literacy cannot be taken as fixed because it is always evolving. Mark (2009) states that "there is no single universally effective or culturally appropriate way of [...] defining literacy" (p. 108). On the contrary, for the author, any definition of literacy should "be seen as a function of the social, cultural, and economic conditions" (p. 108) of the medium in which it was produced. His definition of literacy, or "literacy practices," is very broad and may include "routines, skills, and understandings that are organized within specific contexts, and also the feelings and values that people have about these activities" (p. 120). Thus, we see that literacy has a strictly local nature and, therefore, cannot be conceived in a universalizing way, that is, through global and generalizing definitions.

Castell, Luke and MacLennan (1986) argue that "the technocratic approach to education has come to dominate current educational practice and research" (p. 6), leading to the dissemination and use of assessment practices of school literacy through standardized instruments. This is, according to the authors, one of the problems that justify the perceived "literacy crisis" due to the "discrepancy between what counts as literacy in the school, and the actual kinds of literate competence useful in community and occupational activities" (p. 7). It is precisely this conception of literacy as something that meets the needs and demands of the "work and citizenship in modern society" that Castell, Luke and MacLennan call "functional literacy," that is, an attempt "directed toward articulating a concept of literacy that is relevant to the more practical aspects of everyday life for society as a whole" (p. 7) and not only for that portion of society seen as the dominant "literate class."

The authors state that the term "functional literacy" has been widely used in various contexts and cite the definition of the 1971 UNESCO Committee for the Standardization of Educational Statistics, which says that "a person is literate when he has acquired the essential knowledge and skills which enable him to engage in all those activities in which literacy is required for effectively functioning in his group or community" (p. 8). For the authors, however, such definitions are not enough, since they don't consider individual differences in relation to the literacy contexts of use.

For this reason, Castell, Luke and MacLennan highlight some issues to consider for a better theoretical understanding of literacy and for the development of teaching strategies and practices. In the authors' view, it would be necessary to take into account "the underlying principles that enable an individual to select, modify, and apply an existing reading competence to a new reading task" (p. 9). According to them, it would be necessary to "enable individuals to apply the information-processing strategies used in reading to other information coding and decoding processes, such as writing, speaking, and nonverbal communication" (p. 9). Another issue to consider would be "the significance of the social and pragmatic contexts within which linguistic interaction occurs," since "the contextual nature of linguistic interaction influences both the acquisition and use of literacy" (p. 9).

Citing Bourdieu (1977), Castell, Luke and MacLennan (1986) use the concept of "expanded competence," defined as "the ability to exercise competence consistently with the variables of social context" (p. 10). For Bourdieu (1977, p. 646), according Castell, Luke and MacLennan, the problem "is not the possibility of producing an infinite number of grammatically coherent sentences, but the possibility of using an infinite number of sentences in an infinite number of situations, coherently and pertinently." It is this notion of expanded competence that Castell, Luke and MacLennan (1986) suggest that should be considered in research on literacy in industrialized societies of the world nowadays.

The conclusion they reach is now widely accepted in the study of literacy. They argue that “literacy is necessarily ‘situational’ [and] operational definitions of functional literacy and criteria for its assessment are always culturally and historically specific” (p. 11). In addition, the authors state that any definition of functional literacy should cover “not merely knowledge of rules and the ability to follow rules, but also the capacity to think, reason, and judge *beyond* existing social rules” (p. 11).⁵⁷

For Gee (2008), any current conception of literacy is “inherently political, in the sense of involving relations of power among people” (p. 31). It is within this conception that literacy should be seen as a social practice. As stated by Soares (1998), by prioritizing the social dimension of the literacy phenomenon, it comes to be defined as what “people *do* with the skills of reading and writing in a specific context, and how these skills relate to needs, values and social practices” (p. 72).⁵⁸ In this sense, literacy is no longer defined in terms of individual skills and becomes, for the author, “a set of social practices related to reading and writing in which individuals engage in their social context” (p. 72).

The author reports that this social dimension of literacy can be interpreted in two conflicting ways. According to her, there is a “weak” version and a “strong” version of the characteristics and implications of the social dimension of literacy. In the “weak” version, the definition of literacy corresponds exactly to what Castell, Luke and MacLennan (1986) have defined as functional literacy, as discussed above. Soares (1998) adds that this view of literacy as a functional skill, that is, that which allows “individuals to *function* properly in a social context” (p. 72),⁵⁹ is a progressive and liberal interpretation of the term, bearing in its wake

the belief that highly positive consequences come, necessarily, from [literacy]: since reading and writing skills are used to the adequate functioning and participation in society, and for personal success, literacy is considered to be responsible for producing important results: cognitive and economic development, social mobility, professional progress, citizenship (SOARES, 1998, p. 74).

As pointed out by Gee (2008), the “literacy myth,” or the belief that having literacy skills produces many positive consequences for the individual, today is discredited because “literacy in and of itself, abstracted from historical conditions and social practices, has no effects, or, at least, no predictable effects” (p. 45). According to him, what produces these consequences “are historically and culturally situated social practices of which reading and writing are only bits, bits that are differently composed and situated in different social practices” (p. 45).

This view, according to Soares (1998), reflects the “strong” version of the literacy concept in which literacy “cannot be considered a neutral ‘tool’ to be used in social practices whenever required” (p. 74). Much more than that, literacy, in this concept, is defined as

a set of socially constructed practices involving reading and writing, generated by wider social processes, and responsible for strengthening or questioning values, traditions and forms of power distribution present in social contexts (p. 74-75).

The so-called “strong” version of the literacy conception gave rise to some of the most fruitful studies on literacy, in the way it is interpreted and understood in current research. This new way of understanding and interpreting literacy became known as “new literacies” and later, “multiliteracies,” as discussed below.

NEW LITERACIES AND MULTILITERACIES

Larson and Marsh (2005) explain that, from the late 70s and early 80s on, literacy researchers began to describe the practices of reading and writing as intrinsically linked to social practices in use in specific social groups, challenging the traditional way to approach reading and writing. Important names among these researchers are Shirley Brice Heath (1983) and Brian Street (1984), and the seminal work of Scribner and Cole (1981), ushering in what is now known as Studies of New Literacies or New Literacy Studies (Baynham & Prinsloo, 2009; Larson & Marsh, 2005). Gee (2008) and Baynham and Prinsloo (2009) argue that these studies began to emerge in the early 1990s from research in different fields of knowledge.

Thus, studies of new literacies emerged in opposition to the traditional view, then dominant, that literacy is a set of cognitive or psychological skills that people have, and that can be taught in a neutral way in formal or informal teaching contexts. For Larson and Marsh (2005), studies of new literacies see literacy as a complex social practice and critique, built upon daily social interactions in specific contexts.

Traditionally, literacy was treated as an individual skill and school development was evaluated through a carefully planned linear path. Larson and Marsh (2005) argue that traditional approaches to education believe that literacy is a set of skills that can be taught in isolation and that the individual practice and repetition of these skills are sufficient for learning them. In addition, traditional literacy practice in schools follows a linear model which, according to the authors, introduces specific concepts depending on specific stages of learners’ cognitive development, mainly based on their age, since it “assumes that children progress in similar ways and acquire specific skills in sequence” (p. 4-5). However, Larson and Marsh say that, in this traditional approach, children who are unable to acquire such skills at the same rate as their peers are seen as “inadequate,” thus leading to the creation of a “deficit model” (p. 5).

Larson and Marsh add that traditional models of literacy are associated with children following a so-called “normal” development path, that is, “a child who, it is assumed, lives in a family which should support the child’s development through the provision of particular resources and literacy practices” (p. 5). According to the authors, this is how social norms and practices of white, middle class families are now recognized as literacy experiences desirable for all children.

As Gee (2008) has noted, throughout our history, the use of language has constituted a point of identification among human beings, that is, language is “what makes us human and what distinguishes us from other creatures on earth” (p. 50). However, literacy has become a point of differentiation among human beings themselves, separating the literate from the non-literate, and assigning specific – and culturally more valued – features to the literate ones, such as intelligence, modernity and morality, and linking literate individuals and cultures to the notion of civilization. Even among literate individuals and cultures, literacy can be taken

as a point of differentiation among individuals if considered from traditional views, that is, when it is seen as a single cognitive ability that can be learned in an isolated and neutral way. That is why, according to Larson and Marsh (2005), literacy can be used to distinguish learning among school children, leading to discrimination, that is, the belief in the capacity of some of these children as opposed to the incapacity of others.

New literacies researchers are, therefore, contrary to these traditional practices and advocate literacy models that transfer the focus from understanding literacy as an individual cognitive ability to situated social practices. For these scholars, literacy is socially constructed and teaching approaches of literacy understand and emphasize the social nature of learning and the importance of discursive communities that are established in classrooms, viewing learning as small changes in the form of participation of learners.⁶⁰ Thus, as stated by Gee (2008), “the New Literacy Studies has begun to replace the traditional notion of literacy with a sociocultural approach” (p. 67). As literacy was seen as a “plural set of social practices” (p. 67), researchers began referring to them as literacies in the plural.

With the advent of new information and communication technologies, a group of researchers began to work with the idea of multiliteracies and “attracted educators’ attention to the way in which communicative modes were proliferating and changing due to advances in technology” (Larson & Marsh, 2005, p. 3). This group met for the first time in 1994 in the city of New London, New Hampshire, in the United States, and thus became known as the New London Group (Cope & Kalantzis, 2000). Among these researchers we find such names as Bill Cope, Norman Fairclough, James Gee, Mary Kalantzis, Gunther Kress, and Alan Luke, for example. These researchers started to show how technology began to transform the ontological and epistemological foundations of literacy, creating new social practices and influencing their contexts.

According to Cope and Kalantzis (2000), this group chose the word “multiliteracies” to summarize the results of their discussions due to two arguments: “the multiplicity of communication channels and media; [...] and the increasing salience of cultural and linguistic diversity” (p. 5). The first argument, according to the authors, refers to the “increasing multiplicity and integration of significant modes of meaning-making, where the textual is also related to the visual, the audio, the spatial, the behavioural and so on” (p. 5), that is, nowadays meaning is created in an increasingly multimodal manner. The second argument concerns the new reality imposed by globalization processes related to an “increasing local diversity” while demanding “global connectedness” and, therefore, “we have to negotiate differences every day, in our local communities and in our increasingly globally interconnected working and community lives” (p. 6). According to the authors, these two points – the multiplicity of meaning-making modes and the growing of local diversity combined with global connectedness – can potentially transform both the substance of the literacy practices and the pedagogy of literacy in our society, which requires both educators and students to take active roles aiming at social change.

Thus, the concept of multiliteracies complements and supplements the traditional notion of literacy, centered only in the national language as monolithic, singular and stable. In contrast to this traditional view of language and literacy, the concept of multiliteracies focuses

⁶⁰ Larson & Marsh (2005) explain that these small changes in learners’ participation, which they call “learning as changing participation”, are changes which occur over time as the abilities and expertise of the participants of the context grow. They also say that “people learn by participating in culturally valued activities” (p. 10).

on different modes of representation, other than language, which may vary according to the context and the culture of the social group they belong to.

The concepts of new literacies and multiliteracies, thus, are the basis for innovative approaches to understanding literacy practices present in the globalized society of the twenty-first century. Researchers currently involved in these studies focus on the notion that these literacy practices are not individual, but social, that is, they are shared by specific communities and social groups and, therefore, are plural.

LITERACY MODELS

According to Street (1984), it is possible to distinguish basically two models of literacy that are currently used in various disciplines: the autonomous model and the ideological model. In the autonomous model, literacy is seen as “a neutral technology that can be detached from specific social contexts” (p. 1). Theorists who hold this view believe that literacy plays a central role in the development of intellectual competence of individuals and that the learning of specialized forms of writing has a significant impact on language and thought. For these theorists, literate societies, that is, those who have appropriated the written culture, and oral culture societies differ from each other significantly due to “fundamental differences between oral and written language” (p. 20). According to Street, in this conception “oral language is always directed to a particular individual usually with some intended effect such as influencing his views, maintaining a certain relationship or controlling his actions” (p. 20). Moreover, this kind of language also “can be constantly modified according to its effect and thus the social function dominates the logic” (p. 20), but this requires concrete support in reality, as in face-to-face interactions in which the speaker modifies his propositions according to the listener's reactions. Street explains that “written language, on the other hand, makes such interpersonal functions less critical; it can be conducted over time and space and is less subject to immediate feedback” (p. 20).

Street further explains that for these theorists “oral speech depends on context to communicate meaning [and] it is therefore egocentric and takes for granted a common point of view as though no others were possible” (p. 21). Street says these authors believe that the written word has certain “inherent qualities” which allow the cognitive development of individuals who are literate, such as the capacity to allow abstraction and being less connected to the here and now, besides fostering the “development of ‘logic,’ the distinction of myth from history, the emergence of scientific thought and institutions, and even the growth of democratic political processes” (p. 5).

Because of these differences between oral language and written language, supporters of the autonomous model argue that “members of literate societies have the possibility of developing logical functions, of specializing in the ‘truth functions’ of language, and of extracting themselves from the embeddedness of everyday social life” (Street, 1984, p. 20). In literate societies, thus, individuals would be able to acquire, through schooling and literacy, abstract habits of thought, which would be impossible in oral culture societies. The natural consequence of the lack of writing in oral cultures, for these authors, would be a diminished intellectual capacity of individuals, in relation to the individuals of literate cultures. Literacy,

thus, would be responsible for significant cognitive differences between the two types of societies.

Street, however, counters these arguments and states that their supporters would be promoting a new version of the so-called “great divide,” that is, the classic division of societies in terms of criteria such as logic/pre-logical, primitive/modern and concrete/scientific, to add a new criterion: literate/pre-literate. Street argues that there is evidence of

scientific and non-scientific thought in all societies and within all individuals [and] representations of cognitive ‘deprivation’ [in oral cultures] were founded upon misunderstanding of the real meanings of such people’s statements and actions, and upon ethnocentric assumptions about the ways in which logic can be recognized (p. 26).

Countering the arguments of the defenders of the autonomous model of literacy, Street claims that “it is sufficient to establish the fact that to speak a language at all is to employ abstraction and logic” (p. 26). Street argues that the idea that literacy promotes the development of the logical functions of language cannot be taken as absolute, since “the consequence [of literacy] will depend on the social role, functions and meanings of its practice” (p. 41).

The autonomous model, as already discussed, argues that certain “correct” skills are necessary for the individual to achieve greater cognitive and economic development, professional advancement and hence social mobility. These skills must be taught through literacy. Bringing these ideas to the teaching of English as a Foreign Language, we can say that, traditionally, various approaches to EFL teaching already applied throughout history identify with the autonomous model described by Street, such as Grammar Translation and the Audio-lingual Method (Richards & Rodgers, 2001). In the Audio-lingual Method, the mechanical repetition in the form of drills would be responsible for producing accuracy or an ideal linguistic pattern, generating confidence in the learners, who are then responsible for transferring their learning to the situations of social life. Researchers have concluded, however, that the language forms which were repeated to exhaustion during English classes in the 60s and 70s - the golden age of audiolingualism in Brazil and in the world - could hardly be transposed to real contexts, mainly because the pedagogical contexts were in many cases distant from the students’ context of use. This method, however, is still very much used in many EFL teaching contexts in Brazil (Mattos & Valério, 2010), along with other traditional practices, such as translation, as shown in my own research conducted with three English teachers from different public school contexts in the metropolitan area of Belo Horizonte, in Brazil (Mattos, 2011). These teachers admit that, at different times, they have used or still use translation in their classrooms, in order to guarantee student comprehension. Mauricio, for example, one of the research participants, used to employ reading and translation activities frequently with his 5th grade elementary students in order to ensure that they had understood the English text. In the excerpt below, Mauricio reports on the reasons he had for asking his students to translate a short comic story.⁶¹ First, he says he asked for the translation because students would take a test based on the text. Then, he admits he requested the translation of the text because he needed time to correct the students’ notebooks.

⁶¹ See appendix.

M: Then they had to copy the comic... First I showed them how to do. Then they copied.

R: Humhum. [...] Then you asked them to do the translation at home?

M: They did it in class. Many of them have no dictionaries at home.

R: Oh, okay, so you let them do the translation in class.

M: Yeah, in class. That's it.

R: But why did you ask them to translate the comic story?

M: Oh, I thought, well, as they were going to take the test, I thought, well, just to see how they...

R: Do you think they didn't understand the text?

M: No, only by reading on their own they would not understand, for sure.

R: They wouldn't?

M: No, certainly not...

R: Not even with the aid of the images?

M: No. I made this experience. I tried... I started reading the story, and started asking them... what they thought was going on in relation to the... the images. Some groups of students could do it. Then, after that I... after that I asked them to translate it.

[...]

M: But, as I was saying to Dora... I liked the translation they did. Ahmm, because then we did collective correction, you know? They could do it, all right.

[...]

M: Another thing that led me to do that also: I had to check their notebooks. So, while they were doing the translation, I was already taking the opportunity to check their notebooks.

(Collaborative Action Research group meeting)⁶²

As we see from the excerpt, Mauricio seems not to rely on the ability of his students to understand a text from clues, or non-verbal information, such as the images in the comic story. However, he admits that some groups of students were able to understand the text content with the help of the images. Still, he asked all students to do a written translation of the text, while he corrected notebooks. This reveals that Mauricio's views on what it means to know a foreign language is still rooted in the idea of *knowing the language*, or understanding the words, regardless of any other resource that could be used to aid comprehension, as it would have been the case from a New Literacies view. Unfortunately, as indicated by some recent work in the area of language teacher education, as already mentioned, Mauricio is not an isolated case in the Brazilian context, neither was he the only participant in the research who reported the use of translation. The other two participants - Dora and Cris - also made use of translation in their classrooms. Dora, for example, said that she had always wanted her students to be "excellent translators." She also said that teachers, including herself, "are only concerned with teaching grammar rules and translation." Cris in turn, commenting on one of the activities she developed with her students, reported that she wrote some discussion questions on the board and translated each question before letting the students discuss them in groups, because she wanted to make sure that everyone had understood all the questions. This shows that these teachers still share the idea that to learn a foreign language it is necessary to

⁶² Conventions: M → Maurício (participant); R → Researcher; [...] → Comments not relevant to the issue of the comic story (see Mattos, 2011).

know the meaning of each word used, regardless of the context of use, a mechanistic view that is consistent with the concepts of the autonomous model of literacy.

Over time and due to the domination interests of various societies, written culture became prevalent in many parts of the world. Street (1984) asserts that in many literate cultures, the predominance of written language can be explained by the “important functions that writing performs in these societies” (p. 60). Therefore, writing has a higher social prestige. In his analysis, Street cites several authors who advocate that written language is endowed with greater objectivity and allows the writer to address the reader without revealing status or other social marks. Street counters the neutrality of the written language and states that both the way a person talks and the content of what is talked about may reveal social marks. Street uses the English language as an example and shows that several features widely used by the “academic language” to express neutrality and objectivity, such as the use of impersonal pronouns (e.g.: ‘one’), certain lexical choices and grammatical structures (such as the passive voice), are actually compelling marks of status and attitudes, are imbued with power and, therefore, cannot be considered neutral and/or objective. On the contrary, these choices reveal that language, both oral and written, is socially conditioned and transmits a particular worldview. According to Street, each language conveys a specific worldview, which, therefore, is never neutral or objective, and no language is capable of any objectivity that can be taken as universal. Thus, different languages would be able to express different levels of subjectivity and, on the other hand, “all languages have the potential to make abstract, relatively neutral statements, if called upon to do so” (p. 80). Street says that the alleged higher intrinsic objectivity of writing can be based on “socially constructed beliefs about what literacy can achieve” (p. 84). Therefore, one should always consider the context, taking account of the purpose of any specific statement and the place in which it operates.

Street adds that “meaning is not simply in an utterance, irrespective of the participants: to understand it we must take into account the inter-subjectivity of the participants” (p. 85), without leaving aside questions such as “who controls the meaning and the nature of the reference” (p. 85) in a given communicative relationship. Similarly, in relation to writing, the author argues that there is no ‘literal meaning,’ that can be considered neutral and may be isolated from any context. For Street, demystifying the value of writing in literate societies means realizing that any writing system is deeply tainted by cultural, economic and technological constraints of the society it belongs to and where it originated, and its meaning depends on the social situations where it is used, the participants in these social situations and purposes that guide them. Street also states that different cultures develop different conventions for writing and that each culture chooses different writing characteristics as the most significant. For him, therefore, these processes are responsible for a wide variety of different literacies.

To counter the autonomous model, Street (1984) proposes an alternative model, which he named “ideological model” or “social practices model.” The ideological model “assumes that the meaning of literacy depends upon the social institutions in which it is embedded” and that “the particular practices of reading and writing that are taught in any context depend upon such aspects of social structure such as stratification [...] and the role of educational institutions” (p. 8). The author adds that the uses that different societies make of literacy are based on conventions and, therefore, are not universal and cannot be defined in terms of technical skills, as conceived by the autonomous model.

The notion that literacy leads to progress, civilization, facilitates individual freedom and fosters social mobility – basic premises of the autonomous model – Street calls “literacy myth” (p. 104), an allusion to Harvey J. Graff’s book, in which the social historian questions this understanding. Street believes that “since the introduction of literacy [in any society] is always accompanied by the introduction of new forms of social organization, differences in thought processes cannot [...] be attributed to literacy *per se*” (p. 103). Thus, Street agrees with Graff when he argues that

greater literacy does not correlate with increased equality and democracy nor with better conditions for the working class. Rather it correlates with continuing social stratification (p. 105).

Street (1984) concludes that literacy itself, as it is practiced and learned in schools, is not “sufficient to overcome ascribed characteristics rooted in age, gender and race” (p. 106). Education, thus, serves better the dominant classes, as a way to reproduce their values and social control, than as a real form of progress and mobility for the less privileged classes. Monte Mor (2009) asserts that “the seemingly neutral practice acts ideologically in favor of an education in which teachers are seen as owners of knowledge” (p. 184) and points out that “a technique-oriented practice by itself lacks a critical approach that is often repressed by its reproductive aims” (p. 184).

Street (1984) says that the introduction of literacy in modern societies did not occur abruptly, with the suppression of oral practices and immediate replacement of these practices by written practices. On the contrary, this introduction was slow and gradual, and was facilitated by mixing oral and written modes and a gradual transition that allowed the adaptation of forms of writing to the already familiar oral practices. This overlap or “mix” of oral and written modes, at that time, was essential for the survival of culture and is still present in most societies. As Street exemplified, this overlap can be found in the use of international conventions to signal traffic on roads, a practice that “uses written words as little as possible” (p. 110), using instead icons and symbols. According to the author, “this is not merely a gesture towards those labelled ‘illiterate’ but rather a recognition that communication operates through ‘mixed’ modes for all, whether ‘literate’ or not” (p. 110).

However, the use of these international conventions is not always conflict-free. Conflict, in these cases, is frequently generated by differences between globalized cultural perceptions and the local customs and cultures of the communities where the conventions are used. As an example, in countries in North America, mainly the United States and Canada, it is common to find road signs indicating “animals ahead” with the symbol of a deer, an animal which is commonly found in that region, as shown in Figure 1 below.

This symbol has become an international convention and is used in several countries, including in Brazil, where the deer is not commonly found in cities. The Brazilian Manual of Traffic Signs⁶³ (volume II – Vertical warning signs), which describes the various warning signs to be used in Brazil, determines that this symbol is used in Brazilian public roads, as shown in Figure 2 below, which reproduces part of the Manual warning signs⁶⁴ list.

⁶³ Approved by Resolution 243, dated 22/06/2007, by the Nacional Council of Traffic, available from <http://www.dnit.gov.br/rodovias/operacoes-rodoviaras/prosinal/19-manual-vol-ii-sinalizacao-vertical-de-advertencia.pdf>, access on 15/Dec/2010.

⁶⁴ The meaning of the signs are A-35: Animals / A-36: Wild Animals.

Figure 1. Road sign indicating “animals ahead” in urban areas in the city of Winnipeg, in Canada (author’s personal archive).

	A-35	Animais
	A-36	Animais selvagens

Figure 2. Partial representation of the list of the Brazilian Manual of Traffic Signs (Volume II - Vertical Warning Signs).

However, as I have already highlighted, the animal that symbolizes the presence of wild animals in Brazilian public roads – the same deer used in other countries – is not easily recognized by Brazilian drivers. Still, the symbol is used all over the country, both in non-urban areas and in large cities, as shown in the following Figures 3 and 4.

The gradual spread of forms of literacy, according to Street (1984), resulted from the interaction of social conditions which allowed the construction of new social practices based on writing. During this gradual process, the changes that occurred over time “were relatively small and often went unnoticed” (p. 114) by the community participants. However, these small changes facilitated the larger process that established the fundamental changes for the development of a literate society, as we know it today.

Street emphasizes that whenever we talk about literacy we are necessarily “referring to the ideology and concrete social forms and institutions that give meaning to any particular practice of reading and writing” (p. 121). Street states that forms of meaning making are always learnt. These may be ways of taking meaning from books or ways of eating, sitting, etc., and are therefore not neutral, since they are always culturally determined. Children from higher social classes, for example, learn to make sense of books long before they start their school life. Street describes Heath’s (1982) work, which showed that these children “learnt

through bedtime stories an infrastructure of pedagogical practices and cultural assumptions which match, to a great extent, those they encounter in schools” (p. 121-2), which puts them at an advantage compared to children who do not go through this family training or whose training is different. Street suggests, then, that these cultural differences in the attitude of families with preschool children may be responsible, at least in part, for the success or failure of school children from different communities or social classes.

Figure 4. Example of road sign indicating “wild animals” in an urban area in Brazil.⁶⁶

Street’s (1984) conceptions on the autonomous model and the ideological model of literacy are certainly important in helping to understand the notion of literacy and to form a set of theories that underpins much of the research on the subject today. We cannot fail to mention, however, that separating the literacy practices and their definitions in fixed models as Street did, isolating them in a binary manner, while contributing to a pedagogic explanation of the two models, also shows how they are confronted by positioning them on

opposite sides. This fixed way of perceiving the literacy practices and conceptions fails to consider that both models are rooted in the social practices of any human activity, that is, even those who believe that literacy is a set of neutral skills with functional objectives will necessarily be perpetuating some kind of ideology. On the other hand, those using the ideological model of literacy are always also developing functional skills in their practices. It may be more appropriate, then, to conceive of literacy practices not in terms of binary models in fixed and opposite poles, but in terms of a continuum in which ideological practices and functional skills mix and overlap, sometimes predominating either one or the other. This seems to reflect a more consistent picture of the complexity and fluidity of literacy practices in any modern society.

LITERACY AS SOCIAL PRACTICE

As we have seen so far, literacy cannot be understood in a neutral way, but should always be regarded as situated in the social practices of a particular community. Soares (1998) explains that literacy, thus, should be defined as that “which people *do* with reading and writing skills in a specific context”⁶⁷ (p. 72), that is, literacy is connected to the way, or ways, in which individuals in a specific community exercise, day by day, their reading and writing skills.

Larson and Marsh (2005) argue that the concept of literacy as a social practice stemmed from studies in the field of sociology of knowledge that support the idea that reality is socially constructed. The authors state that, “in this view, knowledge (and reality) is an ongoing, dialectical construction of worldviews [...] that individuals and social groups construct in interaction with society” (p. 10). According to the authors, “these constructed worldviews are mediated by language and culture in an ongoing process of identity construction” (p. 10).

Thus, the concepts of literacy and what is possible to do with literacy are also built in the daily practices of each society. In this sense, Street and Lefstein (2007) call attention to the fact that

the ways in which teachers or facilitators and their students interact is a social practice that affects the nature of the literacy being learned and the ideas about literacy held by the participants, especially the new learners and their positions in relations of power (p. 42).

In conclusion, for Street and Lefstein, literacy is already part of the power relations in society.

Brandt and Clinton (2002) draw attention to the differences between the terms “literacy event” and “literacy practice,” two important terms that mark the history of new literacies theories. The term literacy event was introduced by Heath (1983, p. 50) who defined it as “any occasion in which a piece of writing is integral to the nature of the participants’ interactions and their interpretative processes” and Street (1984, p. 1) referred to literacy practices as a way to focus on the “social practices and conceptions of reading and writing” of a particular community. Differentiating between the two terms, Brandt and Clinton (2002) say

⁶⁷ Italics in the original.

that a literacy event is “a social action going on around a piece of writing in which the writing matters to the way people interact” (p. 342), and literacy practice is “usually treated as the socially regulated, recurrent, and patterned things that people do with literacy as well as the cultural significance they ascribe to those doings” (p. 342). For these authors, literacy events are observable actions while literacy practices are more abstract and are not always observable.

Barton (1994) says that literacy is a “social activity and can best be described in terms of literacy practices which people draw upon in literacy events” (p. 34). Barton believes that literacy events are embedded in our mental activities and are formed by our consciousness, our intentions and our actions. In addition, for him “any literacy event has a history, both at the personal and at the cultural level” (p. 35), since these events are constructed from past events recorded in our individual and social histories. Some examples of literacy events are, according to Barton, an adult reading a story to a child, a man discussing the contents of a newspaper article with a friend or taking in a message to his son (p. 36). Literacy events may or may not be linked to situations involving learning literacy.

Barton also discusses the notion of literacy practices that, for him, are “social practices associated with the written word” (p. 37). The author states that literacy practices are the various literacy events that occur in our everyday routines. In each literacy event, we make use of various literacy practices developed and/or learned during our experience from the set of social practices of our culture. In the example in which the adult reads a story to a child, mentioned above, both can make use of several typical literacy practices of their culture during this literacy event: for example, the adult can ask the child what (s)he thinks will happen and the child can answer or can ask the meaning of a particular phrase (s)he did not understand. All these practices, and others that could occur, constitute the literacy practices that took place during that literacy event. For Barton, seeing the literacy practices from the point of view of literacy events that occur in our everyday lives, and understanding how they are learned and reproduced based on the set of our social practices, can help to understand “how social institutions and the power relations they support structure our uses of written language” (p. 37).

Likewise, Barros (2009) states that social practices are always laden with language practices, which, in turn, are configured in terms of text genres. Marcuschi (2007) explains that text genres are “concrete linguistic realizations defined by social and communicative characteristics” (p. 23), such as the content, the functional characteristics and the style, among others. We can define, then, the EFL classroom as a literacy event that, at least in theory, involves a literacy learning situation and has, therefore, its own literacy practices which were socially constructed throughout the history of language teaching in Brazil and in the world.

CONCLUSION

It is common for EFL teachers to design classroom activities using different text genres. Thus, these classroom activities may be characterized as language practices, which are part of the social practices of EFL teaching in regular schools, and therefore may be considered literacy practices. These literacy practices are, thus, the ways in which EFL teachers use different kinds of text genres and language activities to teach English in their social contexts,

namely their classrooms in regular schools. These teachers, however, follow different literacy practices that are mostly consistent with traditional practices within the perspective of functional literacy or as a neutral tool, encompassing an autonomous model. In this context, teaching English is seen as a technical skill that can be taught homogeneously, without taking into account the heterogeneity of each educational context and specific social, historical and cultural needs of each learner. Learning difficulties are considered, in such cases, cognitive and personal deficiencies of each learner, who are to blame for not learning. This view exempts the school system from any responsibility with the difficulties faced by specific groups of students, creating a “deficit” model (LARSON; MARSH, 2005), as we have discussed.

Such practices have long led teachers and other school community members to separate students on opposite sides of the classroom in terms of good students and bad students, successful or unsuccessful, with or without aptitude for learning foreign languages, motivated or unmotivated, among other concepts. These concepts have been widely studied in academic research that has focused, all too often, on the individual characteristics of learners that may contribute to success in language learning. Research on such concepts, however, has failed to take into account the social and historical characteristics that also influence literacy learning processes. Moreover, as Mark (2009) has pondered, although some studies have tried to define literacy in terms of “broader sociocultural contexts, the functional view of literacy as a skill to be mastered still appears to have currency within policy making” (p. 108). The author adds that even recent official documents do not usually consider literacy as a critical practice.

In Brazil, the Curriculum Guidelines for High School Teaching – Foreign Languages (BRAZIL, 2006) has introduced the concepts and theories of New Literacy Studies to EFL teaching, advocating in favor of the urgent need to reform educational practices in our society. Lately, the document has influenced a lot of research on literacy practices in the area of teaching EFL and Language Teacher Education.

Knowing the traditional practices of literacy and recognizing their origins is a first step towards a possible pedagogical change in the EFL classroom and towards new research directions in the area. This chapter, therefore, had the objective of introducing the concepts and practices advocated by the theories of new literacies in order to foster greater use of such theoretical approaches to English teaching by teachers and researchers both in their classrooms and as the focus of their research, paving the way to a long awaited change in the teaching of EFL.

ABSTRACT

This paper provides an update on a decade of neuroimaging studies (using electroencephalography, EEG, and magnetoencephalography, MEG) that have focused on linguistic processing in patients with aphasia. The goal of this paper is to shed light on the challenges and usefulness in using such techniques for the study of aphasia. We review study objectives, techniques and results, and highlight the linguistic structures that have been studied. The first part defines the challenges and usefulness of EEG and MEG techniques for aphasiology; the second reports the procedures, targets and main results of reviewed studies; the last section addresses the following issues: What does neuroimagery add to classical behavioral studies on aphasia? Are they both necessary and why?

INTRODUCTION

The term “aphasia” stands for language impairments that arise following a brain lesion. Aphasiology can be defined as a science that infers neurocognitive organization of the human faculty of language from the study of deficits observed in aphasic patients. It also aims at developing therapeutic treatments for language recovery.

Although the first generation of neuropsychologists (e.g., Bouillaud, Broca, Wernicke) succeeded in identifying important brain areas involved in language processing from an empirico-inductive perspective, this classical approach has since been declared insufficient for the purpose of inferring precise language organization in the brain (Démonet & Thierry, 2001). Differences in lesion site and extent, and the particular background characteristics of individual subjects (e.g., age, gender, bilingualism, treatment, etc.) give rise to high levels of heterogeneity in aphasic manifestations. This makes it difficult to correlate a given specific cognitive function with any specific brain area, based only upon the study of aphasic symptoms. However, advances in the development of neuroimaging tools have allowed researchers to assess healthy individuals in order to explore the neural underpinnings of language. They have shown that the language network in the brain is much more extended than was thought before: it involves both hemispheres and the coordinated activity of multiple structures (Hagoort & Poeppel, 2013). Thus, neuroimaging techniques should be considered as complementary tools to traditional approaches in aphasiology for the study of neurocognitive underpinnings of human language. The present chapter is concerned with neuroimaging studies that assess language processing in aphasia. We present their goals, challenges and perspectives in the context of aphasiological research. We specifically focus on studies developed over the last decade using Electroencephalography (EEG) or Magnetoencephalography (MEG)⁶⁸.

1. CHALLENGES AND USEFULNESS OF ELECTROENCEPHALOGRAPHY AND MAGNETOENCEPHALOGRAPHY TECHNIQUES FOR THE STUDY OF APHASIA

In the arena of clinical aphasiology, functional Magnetic Resonance Imaging (fMRI) studies are ubiquitous. Despite the growing number of Electroencephalography (EEG) and Magnetoencephalography (MEG) studies on normal language processing that have the potential to provide useful data for the further study of aphasia, only a few studies using such techniques to assess language processing in aphasia have so far been run. Before discussing the reasons why the use of these techniques appears to still be rare in aphasiological research, we define some basic concepts in neuroimaging research.

⁶⁸ For a review of fMRI research on language processing in aphasia, see Crosson, McGregor, Gopinath, Conway, Benjamin, Chang, Bacon Moore, Raymer, Briggs, Sherod, Wierenga & White, 2007.

1.1. Neuroimaging Techniques

fMRI, EEG and MEG are non-invasive imaging techniques that aim to characterize different aspects of neuronal activity in the brain, both in time and in space. Whereas EEG and MEG track underlying electrical activity of the brain, fMRI maps local changes in brain blood flow. EEG and MEG each provide data with high temporal resolution (measured in milliseconds). While data from EEG are limited in spatial resolution information, both MEG and fMRI allow for high-level anatomical detail. Localized neural activity from MEG data is called electromagnetic source imaging (EMSI). In turn, fMRI detects local increases in relative blood oxygenation and provides good spatial but relatively poor temporal resolution (Halchenko, Hanson & Pearlmuter, 2005).

Traditionally, much of the research on brain imaging in patients had used magnetic resonance imaging (MRI, i.e., brain images based on magnetic resonance fields) combined with fMRI methods to study language processing in aphasia. MRI is used to visualize the brain structures and any architectural pathology which may be present, but not the cognitive functions of the brain. During *functional* magnetic resonance imaging (fMRI), participants perform a particular task during the imaging process, causing increased metabolic activity in the area of the brain believed to be linked to cognitive processing demands caused by the task. In this case, changes in blood flow are measured and superposed on the MRI. The usefulness of fMRI is clearly linked to this method's high imaging resolution for brain structures and lesions, which have obvious advantages when studying patient populations. However, this approach has a major disadvantage in the time domain, as recording time resolution is quite low (in the order of seconds, as it takes between 1 and 2 seconds for *Blood-oxygen-level dependent* (BOLD) levels, which are what are measured using fMRI, to change following a stimulus). As we know that language processing operates within hundreds of milliseconds after stimulus presentation, and unfolds rapidly and quite automatically over time during the processing of a stimulus or a sentence, much information on the time-course of language processing is not available to us using this method.

More recently, the use of event-related potentials (ERPs), which are electrical waves extracted from the EEG signal, have allowed for more fine-grained interpretations of ongoing cognitive processes during language processing, and have become an important source of evidence on the functional organization and temporal dynamics of language processing. ERPs are characteristic patterns of voltage change extracted from scalp-recorded electrical brain activity, time-locked to the presentation of critical linguistic (or other) stimuli (Luck, 2005). They can provide information at the level of millisecond-by-millisecond changes in brain activity. Systematic differences between ERP waves (or "components") in different experimental conditions can be used to study and understand neurocognitive processes involved in different aspects of language processing. ERP components differ in terms of polarity (whether deflections are negative or positive going), onset latency (when the curves depart from each other), duration (how long deflections last), topography (what their distribution is on the scalp), latency shifts (differences in onset or offset latency depending on experimental conditions or populations), and amplitude (the size of the difference between ERPs in two or more conditions).

EEG measures coordinated electrical brain activity. To record an EEG, electrodes are placed over multiple areas of the scalp to detect patterns of electrical activity. Scalp-recorded activity generated by the co-activation of tens of thousands of neurons in a region of the

neocortex engaged in cognitive operations results in the ERP components observed. A number of ERP components linked to linguistic sub-domains such as phoneme discrimination, word segmentation, prosodic and intonational phrasing, morphology, conceptual semantics, syntax, discourse processing, and more have been identified in the last forty years (Hagoort & Poeppel, 2013). It should be noted that there is no one-to-one mapping between specific linguistic sub-domains and ERP components. That is, multiple domains of language processing can elicit similar ERP components, while processes involving what are considered to be unitary processes in linguistics (e.g., agreement checking) can elicit multiple components in the ERP wave. However, the waves found in specific linguistic contexts (e.g., morphosyntax, syntax, and word processing) are quite stable across experiments and languages, and therefore allow us to study the neurocognitive underpinnings of normal and impaired processing of language. For example, the N400, a negative-going wave peaking around 400 ms after stimulus presentation has been used since Kutas and Hillyard (1980) in tracking lexical access and semantic integration.

Magnetic resonance imaging (MEG), which measures magnetic fields linked to electrical activity in the brain, allows for similar fine-grained analyses of ongoing neurocognitive processes. In addition, this technique can provide better spatial resolution than ERPs because of the nature of the recording (see Rodden & Stemmer, 2008). The MEG equivalent of ERP is the event related field (ERF). ERFs measure changes in magnetic fields, again linked to the processing of a critical stimulus. ERFs show similar timing and amplitude changes as those found in ERPs but are always positive going, never negative. As with ERPs, reliable ERF components are observed in language-based experiments (see, e.g., Salmelin, 2007). However, they are not as widely used as ERPs for the study of language processing, in part due to higher operational costs for MEG.

1.2. Challenges in Neuroimaging Research on Aphasia

Research into the neural basis of language processing is complicated by many factors linked to the specificities of aphasic populations (Démonet & Thierry, 2001). The considerable variability of lesion size, shape, and location and individual backgrounds may give rise to different spatial and temporal brain activity patterns. In some cases, it might be more suitable to analyze results at the individual subject level, rather than at group levels, in order to draw conclusions on the neurofunctional organization of impaired language processing.

On the other hand, the use of neuroimaging techniques also faces methodological challenges when used to assess impaired linguistic systems after brain damage. EEG and ERFs are characterized by their great temporal resolution. This means that they are highly sensitive in detecting ongoing cognitive events being processed in the brain, which are expressed through voltage or magnetic changes. But being sensitive to the most discrete implies being affected by the less discrete, which can be a disadvantage for data analysis and interpretation. Indeed, strong artifact signals generated by eye, mouth and tongue movements can mask cortical activity measurements related to cognitive processing.

Even though progress has been made to remove disruptive field patterns from the MEG data (Salmelin, 2007), imaging language production in aphasia remains challenging. For instance, in neurotypical participants, trial onset timing is defined according to the tight

temporal relationship between stimulus presentation and response. However, patients' average response latencies are much longer and variable, making it tedious and less useful to set up an experiment that integrates measures of speech output speed and accuracy (Crosson et al., 2007). Moreover, ERP and MEG experiments need to present numerous stimuli in order to overcome high signal-to-noise ratios. This, coupled with the inherent inter-subject variability, creates larger signal to noise ratios in patients than with neurotypical participants. This might explain why, despite their apparent usefulness for the study of neurocognitive processing, we find very few ERP and MEG studies that have been carried out on aphasia and language production.

Rare neuroimaging studies have dealt with language production in aphasia (Sörös, Cornelissen, Laine, and Salmelin, 2003). To our knowledge, no study has yet assessed either phrase or sentence production in aphasics. The assessment of overt speech in patients with aphasia is useful, as it allows investigators to track response accuracy with the goal of determining if specific brain areas are necessary for the production of correct linguistic outputs. However, language production studies are constrained by the necessity to remain still during data collection and recording, and are additionally problematic with ERP as muscle movements create artifacts in the EEG wave.

This is probably the main reason why most neuroimaging studies of aphasia assess language comprehension. However, problems can emerge while assessing comprehension in patients with aphasia, as it can also be delayed and variable. Moreover, covert tasks prevent investigators from checking whether participants apply instructions accurately or have understood the stimuli. Finally, since aphasic participants may have difficulties either in retrieving words, or in producing responses once words are retrieved, it remains unclear whether observed activation patterns reflect word retrieval or post-retrieval response production difficulties.

In addition, some studies reviewed here (e.g., Angrilli, Elbert, Cusumano, Stegagno & Rockstroh, 2003) mainly focus on brain lateralization patterns rather than the time course of cognitive processes, which is unusual in ERP studies where timing effects are more relevant than their distribution over the scalp, due to the inverse problem⁶⁹. Because of poor spatial resolution in ERPs, this methodological approach is usually not appropriate for research questions bearing on localization. The technical challenges related to the use of neuroimaging in aphasia (experiment modality, setting up time) in addition to problems linked to behavioral approaches (high variability of lesion sites and extent, distinct background, variable syndromes, different reorganization etc.) raise the issue about the point of doing research on aphasia using such techniques. The following section presents some benefits of neuroimaging studies for aphasiological research.

⁶⁹ The fact that the neural correlates of the recorded activity on the scalp cannot be inferred from the electrode(s) where the activity was recorded, due to distortion from brain and scalp tissue. This is one reason why some researchers prefer MEG or fMRI to ERPs, as they do not suffer from this problem.

1.3. Usefulness of Neuroimaging Techniques for the Study of Language Processing in Aphasia

Currently, one of the main issues addressed by neuroimaging (especially fMRI) studies of aphasia is the role of the non-dominant, usually right hemisphere, versus perilesional cortex in language recovery. Meltzer, Wagage, Ryder, Solomon, and Braun (2013) argue that the use of neuroimaging helps to determine whether increased hemisphere activity during language tasks performed by individuals with aphasia represents takeover of function by regions homologous to the left-hemisphere language networks, maladaptive interference, or adaptation of alternate compensatory strategies. In addition, recent findings highlight the usefulness of temporally sensitive measures when studying aphasia by demonstrating that the latency of electrophysiological markers is of interest in patient populations (Zipse, Kearns, Nicholas & Marantz, 2011).

Both EEG and MEG approaches have obvious advantages in the study of language impaired populations, as they can be used with auditory stimuli, avoiding reading processes that might be impaired in patients, in addition to providing fine-grained information on the time-course of linguistic-cognitive processing. The information that they provide is thus complimentary to traditional approaches for the assessment of language difficulties in special populations, in particular because of their added value of measuring ongoing processes in language comprehension and production, rather than providing end-state data (reaction time and judgment values) or average brain activations patterns over rather long time periods, as is found in fMRI.

Finally, most studies of aphasia have reported dissociations that emerge behaviorally but not at the level of the brain. These indicate the possibility of compensatory strategies in patients' behavior. For instance, Meltzer et al. (2013) observed that right hemisphere activation can be observed with both accurate and inaccurate comprehension performance, which they interpreted as strategic recruitment of alternative networks rather than homologous takeover. Zipse et al. (2011) report that whereas participants with aphasia did not show semantic priming of the M350 (an electrophysiological marker of lexical processing in MEG, roughly equivalent to the N400 in ERPs), they did exhibit significant behavioral semantic priming. Semantic priming studies with neurotypical subjects can also show dissociations between behavioral and ERP data, especially with semantic priming (see Royle, Drury, Bourguignon & Steinhauer, 2012 for a review). Sörös et al. (2003) note a dissociation between noun and verb retrieval that only emerges after the disruption of the normal language network, and which is not visible with electrophysiological tools. Wassenaar and Hagoort (2007) also report that while control individuals show on-line sensitivity to thematic role assignment⁷⁰ between pictures and the sentences, aphasic participants did not display typical on-line ERP patterns, but showed off-line sensitivity to the sentence-picture mismatches.

Such data are of particular interest for aphasiological research as they seem to indicate that aphasic performance is the result of specific deficits bypassed by cognitive strategies. Thus, neuroimaging techniques offer the opportunity to illustrate and measure an assumption that has already been suggested in the literature on aphasia based on behavioral studies, namely that aphasia is not the pure manifestation of underlying linguistic deficits, but the sum

⁷⁰ That is, knowing which noun is the subject (agent) or the object (patient) of the verb, as in *the girl is pushed by the boy*, where the first noun in the patient of the verb and the second one the agent.

of linguistic deficits compensated by cognitive strategies (Kolk & Van Grunsven, 1985; Kolk, 1995; Nespoulous, 1996; Sahraoui & Nespoulous, 2012). It appears fruitful to pursue both on-line and off-line approaches in order to obtain complimentary perspectives in our understanding of language processing in aphasia.

2. EEG AND MEG STUDIES ON LINGUISTIC PROCESSING IN APHASIA: PROCEDURES, RESULTS AND ANALYSES

A general impression that we can take from ERP and MEG studies on language processing is that only a few have used this approach to assess language processing in aphasia. Moreover, most concern language comprehension, and if they deal with language production then it usually is by way of picture naming tasks, that is the production of isolated words. Finally, they generally aim to determine which brain areas or hemispheres are activated – either the non-dominant hemisphere or perilesional areas – in individuals with aphasia performing specific linguistic tasks, in order to identify brain areas involved in language recovery. The present section is divided into three subsections: the first two present recent studies on lexical-semantic and syntactic processing run with aphasic patients; the third contains some remarks regarding our general assessment of these studies.

2.1. Lexical Processing

An ERP study by ter Keurs, Brown and Hagoort in 2002, investigated written word recognition in Dutch-speaking patients with Broca's aphasia (BA), and patients with right hemisphere damage without aphasia (RH), and controls. They asked participants to categorize items according to their word category (open and closed-class words). Of primary interest were ERP negativities linked to early word detection (the early anterior N210-325) and later lexical-semantic integration (the N400, for a review of studies on lexical semantic-processing involving this component, see e.g., Holcomb & Grainger, 2006 and Kutas & Federmeier, 2011). Controls and RH patients showed typical early and late negativities, in addition to a third later anterior negativity, to closed-class words, while patients with BA did not show either anterior component, in addition to presenting a delayed N400 that was longer lasting than those found in the other two groups. It should be noted that the items in this task were not controlled for frequency or length. Thus the closed-class items should have been perceptually salient, as they are typically shorter and more frequent than open-class words⁷¹. These data seem to signal difficulties in early word class detection in patients with BA and may account for observed syntactic difficulties in these patients.

Another ERP study on lexical access using semantic and associative priming again investigated the N400, here modulating it with prime presentation using associative relations (i.e., a word preceded by a semantically related word, e.g., salt-pepper)⁷². In their Japanese auditory study of lexical access in 10 participants with aphasia with auditory processing

⁷¹ Additional analyses integrating these factors did not show specific effects of frequency of word length on the data, however.

⁷² Priming typically reduces the N400 amplitude.

impairments, and 10 controls, Kojima and Kaga (2003) presented related and unrelated word pairs to participants. They observed longer onset and offset latencies, as well as smaller amplitudes for the N400 to unrelated pairs in patients. A correlation between the size of the N400 and an auditory comprehension score that was gathered before the experiment was also found. Behaviorally, the patients' recognition scores for the experimental items were normal but their reaction times were slower than controls. Unfortunately, the groups' ERPs and response patterns were not directly compared in the global ANOVAs, but only in post-hoc *t*-tests. According to the authors, the correlation between the offline measures and the N400 points to the usefulness of the N400 in establishing or confirming a diagnosis of lexical access impairment.

An ERP study led by Angrilli, Elbert, Cusumano, Stegagno and Rockstroh (2003) presents data on rhyming and semantic judgment with word pairs in 10 Italian participants with non fluent aphasia and 10 controls. Using primed rhyming pairs (i.e., a word preceded by another with which it rhimed, e.g., *cat-hat*) or semantically related pairs (e.g., *wood-tree*) and fillers, they asked patients to make rhyming and semantic judgments on the stimuli. Data show different lateralization patterns in controls and patients, as well as longer reaction times and higher error rates in patients. Unfortunately, data were not analyzed on the target but rather the prime. Although stimuli were presented in different blocks, where participants were specifically asked to perform a phonological (rhyming) or a semantic task, thus promoting phonological versus semantic strategies to word recognition, the fact that analyses were made on the first rather than the second word makes it difficult to interpret this data in terms of lexical access, and makes the interpretation more about cognitive strategies used tasks rather than lexical access itself. We have no way of telling whether rhyming or semantic priming had any effect on lexical access and retrieval. In addition, the authors present no functional interpretation of the ERP patterns.

Another lexical-decision task using ERPs was developed by Justus, Larsen, Yang, de Mornay Davies, Dronkers and Swick (2011). They studied a group of patients with aphasia resulting from damage to the pars opercularis (BA44) and the pars triangularis (BA45), i.e., roughly Broca's area, and a group of controls. The authors adopted lesion-based rather than symptom-based inclusion criteria, because they wanted to test the hypothesis that damage to frontal areas -- including Broca's area -- results in a behavioral dissociation between regular verb and irregular normal verb processing, linked respectively to procedural and declarative memory systems (Ullman 1997, 2005). Several studies in healthy people have reported priming stronger effects (reductions of the N400) for regular versus irregular verb forms using ERPs (Münte, Say, Clahsen, Schiltz & Kutas, 1999)⁷³ or behavioral methods (see Forster, 1999, for a review). In previous studies, Justus and colleagues (Justus, Larsen, de Mornay Davies & Swick, 2008; Justus, Yang, Larsen, de Mornay Davies & Swick, 2009) observed that in neurologically healthy individuals, hearing the past tense form of both regular and irregular verbs facilitates an auditory lexical decision to the corresponding present-tense target (e.g., *looked-look*, *spoke-speak*) and is accompanied by a reduction in the N400 component to the target word. On the other hand, other studies reported behavioral dissociations between regular and irregular morphological priming in a group with aphasia

⁷³ Although, see Stockall and Marantz (2006) and Morris and Stockall (2012) for data on *equivalent* MRF and ERP priming for regular and irregular verbs, but not for semantically and orthographically related words (e.g., *boil-broil*).

(Marslen-Wilson & Tyler, 1997; Münte et al, 1999; Tyler et al, 2002). Therefore, in their study, Justus et al. (2011) aimed to test whether this dissociation extend to ERPs in a group with Broca's aphasia. Again, their study highlights a dissociation between behavioral and ERP data: whereas behavioral data show that irregular forms prime more than regular ones, ERP data show similar priming effects for both regular and irregular forms, in patients as well as controls. According to Justus et al. (2011), the ERP data demonstrate preserved lexical integration of all verb types. Thus the absence of behavioral regular-verb priming may not be attributable to pre-lexical or lexical access deficits. The authors reason that the absence of significant regular-verb priming in the response time data rather resulted from post-lexical events (covert articulation, segmentation strategies, and/or cognitive control)⁷⁴.

This study addressed current topics in the domain of neurolinguistics and psycholinguistics, which are still being debated, such as the existence of a dual division of English verb forms (regular/irregular) that links up to distinct neurocognitive processes (procedural/declarative systems) in the brain; whether English verb forms are better classified in a categorical (regular/ irregular) or rather a continuous way depending on morphophonological properties of verb forms (Justus and colleagues defend the view of a gradual, continuous, classification of verbs, distinguishing "weak" and "strong" irregulars, e.g., *send/sent*, and *drive/drove*, as being more and less "regular" respectively); and whether regular/irregular dissociations extend to ERPs. However, we note that the discussion is developed around the relationship between past tense and corresponding present tense forms, but the items used in the present tense in English are morphophonologically identical to infinitive verbs (e.g., *speak*). This may impact on the conclusions drawn by Justus et al. "that the lexical entries for the present-tense targets were successfully pre-activated by the past-tense primes" (p. 13). Indeed, the "cognitive path" (i.e., computational operations) between past tense forms and corresponding present-tense verb forms might not be the same as the one between past-tense forms and infinitives.⁷⁵ In order to test present tense forms in English that cannot be confused with infinitives, 3rd singular forms (e.g., *speaks*) would be more suitable.

Zipse et al. (2011) assessed lexical access in patients with aphasia, age-matched and younger controls, all native speakers of English, using MEG. Their goal was to explore whether individuals with aphasia exhibit differences in the M350, an ERF linked to lexical access and integration (roughly the equivalent of the ERP N400), compared with healthy controls. They also attempted to explore whether M350 differences were associated with either phonological or semantic processing deficits. They used a primed lexical decision task including two stimulus types: identity primed (i.e., a word preceded by itself, e.g., *cake-cake*) and semantically primed (e.g., *bread-cake*), along with control pairs, with targets corresponding to the identity and semantically related pairs but with different primes (e.g., *leg-cake*). Participants were instructed to decide as quickly and as accurately as possible whether the second word in each stimulus pair (i.e., the target) was a real or a nonsense word. The MEG data were analyzed to examine M350 latency amplitude in terms of (a) overall between-groups differences, (b) semantic priming within each group, and (c) identity priming within each group. Consistent with the age-matched control group, the group with aphasia

⁷⁴ Note that the ERP data cannot be interpreted as reflecting *only* pre-lexical or lemma level access to the lexicon since the primes are not masked. Post-lexical effects can be found in ERP priming studies (see Kiefer & Brendel 2006; Kiefer, 2006; and Royle et al., 2012 for a discussion of issues related to task designs and semantic priming effects).

⁷⁵ In addition to the fact that infinitives (citation forms) are typically the most frequent forms in English.

showed both identity and semantic priming behaviorally. In contrast to the control group, the patient group did not show either semantic or identity priming of the M350 response. They also demonstrated longer M350 latencies than either control group. Furthermore, within this group, M350 latencies were positively correlated with a measure of semantic impairment. According to Zipse et al. (2011), increased M350 latency appears to be indicative of a semantic processing impairment⁷⁶. Moreover, they suggest that the dissociation between the electrophysiological and the behavioral results observed in the group of patients — i.e., no semantic priming of the M350 but behavioral semantic priming — is likely due to the fact that whereas the M350 directly tracks pre-lexical and lemma level activation, reaction times reflect the sum of many cognitive processes, including post-lexical checking (Lorch, Balota, & Stamm, 1986). Therefore, they assume that some patients with aphasia might have a lexical activation deficit at the semantic level, coupled with preserved abilities to use strategic post-hoc lexical processes for word recognition. However, since the groups were not directly compared on priming effects, these data are not supported by appropriate statistical methods.

Sörös et al. (2003) present one of the few studies on language production using MEG. However, production was limited to object and action naming from picture stimuli, that is the production of isolated words (nouns and verbs respectively). The purpose of their study was to assess whether the dissociation largely described in the aphasic literature between noun and verb processing can be observed at the neurophysiological level. The study included 10 healthy Finnish speaking university students and one patient with anomia (JP). The drawings illustrated a simple scene including an object and an action. The same stimuli were used for action and object naming. JP showed superior naming of verbs compared to nouns, due to a left posterior parietal lesion. We note that the nature of the verb form elicited in action naming task is not clear. Sörös et al. (2003) only mention that “[b]oth words [objects and actions] used for the instructions are familiar Finnish expressions and have an identical word length.” (p. 1789). However, the prompt “tekee” used to elicit a verb is either translated ‘does’ or ‘is doing’. From a theoretical perspective, it seems relevant to describe the linguistic nature of the stimuli, because priming the production of, and producing, either infinitive, progressive, or inflected 3rd singular present tense verbs may have different implications for neurocognitive models of language processing, and might also simply promote different responses in different patients.

No evident differences were observed in brain activation related to noun and verb retrieval in any participant, despite the fact that a clear behavioral dissociation between noun and verb retrieval was observed in JP, who showed more difficulties in naming nouns than verbs. MEG measurements revealed a specific activation pattern for JP’s object naming in the left inferior frontal cortex, roughly Broca’s area, that was distinct from his action naming as well as from the naming-related responses in controls. Broca’s area seemed to be involved both in action and in object naming, but was activated significantly earlier and more strongly when naming objects. On the other hand, since JP showed increased naming latencies for nouns compared with verbs, the authors argue that this result suggests a temporally deviant and impaired activation of Broca’s area in JP, and conclude that differences in brain activation related to noun and verb retrieval are not evident in healthy individuals but only emerge after the disruption of normal language networks. They also claim that this study is

⁷⁶ However, note that they do not directly test phonological priming, as their “phonological” pairs involved repetition priming.

the first to demonstrate a neurofunctional basis for a dissociation of verb and noun production in an aphasic patient.

In sum, several studies used EEG or MEG to assess lexical access in aphasia. They concern various languages: English, Dutch, Italian, Japanese, and Finnish have been investigated. All but one used a priming task. The study by Söros and al. (2003) is the only one that used a language production task that involved picture naming. All mentioned studies assessed lexical access using isolated words; none used a sentential context. Lexical priming involved open and closed-class words, words of the same semantic fields, rhyming pairs, non words, regular and irregular verbs, past verb forms, and nouns and verbs. Generally, they tracked the N400 ERP component (or the M350 ERF one), to investigate lexical processing and deficits in this domain in participants with aphasia. Results from these studies show a varied picture of impairment, where ERP components in patients do not always reflect, or correlate with, behavioral data.

2.2. Syntactic Processing

Using ERPs to identify strengths and weaknesses in Dutch patients with Broca's aphasia, Wassenaar and colleagues developed three auditory experiments involving sentence comprehension (Wassenaar, Brown & Hagoort, 2004; Wassenaar & Hagoort, 2005, 2007).

Wassenaar and colleagues (2004) assessed morphosyntactic agreement processing in comprehension of simple and complex sentences that required Subject-Verb agreement within conjoined versus embedded clauses. They compared processing of sentences such as *De vrouwen betalen de bakker en nemen/*neemt het brood mee naar huis*, 'The women pay the baker and take/*takes the bread home' (conjoined sentences with less complex syntax) and *De vrouwen die de bakker betalen, nemen/*neemt het brood mee naar huis*. 'The women who pay the baker take/*takes the bread home' (embedded clauses with more complex syntax). The study included three groups of participants: patients with Broca's aphasia (BA), patients with a right hemisphere lesion without aphasia (RH) and controls. While controls showed a typical Syntactic Positive Shift (SPS, often also called the P600, a positive component emerging around 600 ms after critical stimulus) to agreement errors, this component was modulated by deficit severity in the BA group. That is, the stronger the deficit in the patient, the smaller the P600 was. The RH group evidenced normal ERP components and behavioral results. However, no between-group analyses were performed to support differences between patients and controls, which is less than ideal (Nieuwenhuis, Forstmann & Wagenmakers, 2011).

In a follow up study, Wassenaar and Hagoort (2005) compared processing of syntactic and semantic violations in order to track syntactic processing difficulties in a similar group of patients with Broca's aphasia, again in comparison to patients with right hemisphere lesions without aphasia and controls. In the syntactic violation condition, a word-category violation was created by adding a verbal suffix (e.g., -t) on a noun stem, in a position that was ungrammatical given the syntactic context (e.g., *De houthakker ontweek de ijdele schroef/*schroeft op dinsdag*. 'The lumberjack dodged the vain propeller/*propelled on Tuesday'. In the semantic violation, sentences ended with a word that violated sentential-semantic constraints (e.g., *De timmerman kreege en compliment van zijn baas/!bloem*. 'The carpenter got a compliment from his boss/!flower.' ERPs in the syntactic condition show

similar results to the previous study, that is a SPS (or P600) for both the Control and RH groups, and a late and very reduced SPS for the BA group. In the semantic condition, results show expected N400 and SPS components for both the control and RH groups, and a reduced and more focal N400, as well as a reduced SPS, in the BA group. The BA group also shows reduced P300s in an oddball task used to track automatic detection of stimulus (tone) changes. However, their results on the P300 did not correlate with the size of the P600, pointing to distinct cognitive mechanisms. Between-group analyses support differences on syntactic but not on semantic processing. The authors argue that ERPs can identify syntactic structure processing difficulties with BA, and that these processing difficulties can be independent of lexical access, which appears to be normal in the BA patients.

Finally, Wassenaar and Hagoort (2007) assessed thematic processing in similar groups (BA, RH and controls), by way of a picture-sentence matching task, contrasting semantically *irreversible active* sentences (e.g., *The young woman reads the exciting book*), semantically *reversible active* sentences (e.g., *The tall man pushes the young woman*), and semantically *reversible passive* sentences (e.g., *The woman is pushed by the tall man*). Previous studies on neurotypical German participants report a negativity followed by a positive shift (N400-P600) in argument structure violations where thematic roles (agents and patients) do not match up with the verb structure (Friederici & Frisch, 2000; Frisch, Hahne & Friederici, 2004). Results on irreversible active sentences with picture mismatches (i.e., the participants hear *The exciting book reads the young woman* and see [WOMAN READING BOOK]) show a typical biphasic N400-P600 in controls and RH groups, but only a late in P600 in the BA group. Processing reversible active sentences with incongruent images (i.e., the participants hear *The tall man pushes the young woman* and see [WOMAN PUSHING MAN]) induced a similar N400-P600 complex in controls and the RH groups (the P600 being non significant in controls), while no effect was observed in the BA group at the verb, and a slight negativity was observed sentence finally. Finally, reversible passive sentences in incongruous conditions (i.e., the participants hear *The woman is pushed by the tall man* and see [WOMAN PUSHING MAN]) elicited an N400-P600 in controls, a small P600 (with statistically marginal effects) in the RH group and no ERP components in the BA group. The ERPs of the BA group were clearly different from RH and control groups: whereas typical ERPs were observed in all sentence types in RH and control groups, the BA group showed a positive shift time-locked to the onset of the verb only for semantically irreversible sentences. Interestingly, in this study, the authors highlight a dissociation between BA participants' online electrophysiological and offline behavioral measures, suggesting that strategies might be used to compensate their online syntactic processing difficulties. Results demonstrate that BA participants seem to have strong difficulties matching up thematic roles in sentences and images even though off-line behavioral sensitivity to the sentence-picture mismatches were observed.

Similarly, Kielar, Meltzer-Asscher and Thompson (2012) used ERPs to investigate verb argument structure processing in agrammatic aphasia. A grammatical judgment task was assigned to English-speaking participants with agrammatic aphasia, as well as healthy young and older adults. Two conditions were tested: argument structure violations and semantic violations. The latter was included to determine whether participants evidenced the classical N400 effect to semantic anomalies and to investigate possible differences in sensitivity to argument structure and semantic information during sentence processing. In the argument structure condition, a transitive verb was replaced by an intransitive verb, creating an abnormal syntactic context frame (e.g., **Anne sneezed the doctor and the nurse*), since an

intransitive verb does not select direct objects. In the semantic violation condition the final word of each sentence was semantically inappropriate (e.g., *Anne visited the doctor and the !socks*). Participants were instructed to press a green or red button based on their correctness judgment of each sentence. While controls showed a negativity followed by a positive shift (N400-P600), agrammatic individuals only showed a late positivity in response to argument structure mismatches. Additionally, participants with agrammatism showed a relatively preserved but reduced N400 response to semantic violations. According to the authors, these data show that individuals with agrammatism do not demonstrate normal real-time sensitivity to verb argument structure during sentence processing. They conclude that individuals with agrammatic aphasia are impaired in the on-line use of verb information during the integration of individual arguments into an overall sentence context.

More recently and using MEG, Meltzer et al. (2013) assessed sentence comprehension in aphasia by manipulating syntactic complexity in English sentences. Their study included 25 participants with aphasia of various types (e.g., mild-moderate anomic aphasia; mild nonfluent, mild to moderate fluent aphasia; mild anomic aphasia; mild conduction aphasia; moderate Broca's aphasia; very mild anomic aphasia) who retained sufficient language comprehension abilities to participate in the task. Their results were compared to data previously collected from young healthy controls assessed using the same paradigm (Meltzer & Braun, 2011), in addition to controls that were matched in age with the patients. A sentence-picture matching task was used to assess the comprehension of clauses with different levels of syntactic complexity (simple active, subject-embedded, and object embedded), which were either semantically irreversible (simple active: e.g., *The man is washing the glass in the kitchen sink*; subject embedded: e.g., *The man who is washing the car is doing a sloppy job*; object-embedded: e.g., *The glass that the man is washing has a small chip in it*) or reversible (simple active: e.g., *The man is teaching the woman about a hard math problem*; subject-embedded: e.g., *The man who is teaching the woman is discussing a hard problem*; object-embedded: e.g., *The man who the woman is teaching is discussing a hard problem*).

The main goal of this study was to compare behavioral and imaging measures within the group of aphasic patients. Moreover, this study aimed to determine whether increased right hemisphere activity during language tasks reflects functional takeover by regions homologous to the left-hemisphere language networks, maladaptive interference, or adaptation of alternate compensatory strategies. According to Meltzer et al. (2013), their data provide a measure of neural activity related to sentence comprehension, and of sentence content maintenance in short-term memory, which in turn allows them to deal with the controversy opposing two points of view on the nature of syntactic comprehension deficits in patients with aphasia (and object-embedded relative clauses, in particular): Whereas some investigators assume a loss of specialized syntactic processing mechanisms (e.g., Caramazza, Capitani, Rey, & Berndt, 2001; Draai & Grodzinsky, 1999), others suggest a depletion of more general-purpose cognitive resources that are required to handle processing demands of such sentences in working memory (Caplan, Waters, Dede, Michaud & Reddy, 2007). As expected by the investigators, results showed that patients performed well above chance on irreversible sentences, and at chance on reversible sentences of high complexity on off-line tasks. Moreover, they did not observe more activation of the right temporal lobe in aphasics relative to controls, nor that activation correlated with performance. But accurate comprehension was correlated with neural activity in the more dorsal fronto-parietal lobes of the right-

hemisphere, particularly during the memory delay period. Since these areas have been assumed to be involved in working memory (see e.g., Postle, 2006, and Wager & Smith, 2003) and other tasks involving high demands on general cognitive resources such as attention and executive function, Meltzer and colleagues (2013) suggest that patients who successfully compensate for left temporal lobe damage seem to recruit more general cognitive resources during the effortful process of determining sentence meaning. The authors interpret successful sentence comprehension in aphasia as being supported by reanalysis of sentences in verbal short-term memory, which may draw more heavily on right hemispheric networks in aphasic patients than in controls.

The patient group heterogeneity is a useful addition to the discussion about the nature of syntactic comprehension deficits, as argued by the authors: indeed, the fact that every single one of their patients exhibited comprehension failures on the same clause type (i.e., object-relative clause), regardless of the size, location, and extent of their lesion, supports a resource depletion account rather than the loss of specific comprehension mechanisms that would be “located” in one specific part of the brain.

However, in our opinion, in relation to the experimental protocol used in this study, some parameters should be more carefully taken into account in assessing patients with aphasia using neuroimaging techniques. In particular, the total time of the experiment, which was “approximately one and a half hours, including preparation” (Meltzer et al. 2013, p. 1251), seems too long and might induce fatigue, especially given the nature of the task (syntactically complex sentence comprehension) and environment (staying in a machine). After such a long session in such conditions, and because the task consisted in pressing the left or right button on a fiber optic response box to indicate which picture correctly depicted the action described in the sentence, the interpretation of randomness in response patterns is questionable.

In sum, ERP and MEG studies on aphasic morphosyntactic comprehension mentioned in this chapter concern languages less diverse than in studies that deal with lexical processing (see previous section): English, Dutch and German, that is only Indo-European (Germanic) languages. They study subject-verb agreement processing in sentences with different degrees of syntactic complexity (conjoined/embedded, active/passive and irreversible/reversible), verb argument structure (transitive/intransitive) and thematic roles (agent/patient), as well as semantic processing within sentences. Generally, they track both negative (LAN/N400) and positive (SPS/P600) neural signatures linked to lexical and syntactic processing in aphasic individuals, in comparison with neurologically impaired participants without aphasia or controls. Most evidence seems to point to difficult online processing of grammatical errors and complex syntactic structures in patients, as compared to semantic processing.

2.3. Remarks on Linguistic Manipulations in Experimental Tasks

A common approach to semantic and word finding deficits in aphasic patients is to study naming and other lexically-based processing, which is clearly not optimal when we want to assess language processing in its full complexity. The use of sentence structures to study semantics can give us a clearer view of semantic processing *in-context*, and would also allow for a better understanding of the facilitating and hindering factors in semantic processing within sentences in aphasics. As we saw, patients' results on semantically oriented questions in the sentence processing tasks were occasionally similar to controls. Semantic processing

within sentences, a common technique in ERPs (Kutas & Hillyard, 1980; Kutas & Federmeier, 2000), should be developed to better understand what aspects of sentence processing are impaired, or processed differently, in patients with aphasia, especially those with semantic deficits.

In addition, we note that no study compared different groups of aphasic speakers. Some, such as Wassenaar and colleagues compare neurologically impaired patients with and without aphasia, but not between different aphasic subgroups. Since similar symptoms can arise from different lesions -- for example, word retrieval deficits technically called anomia, are found in many aphasia subtypes -- it might be useful to assess neural activity of a group of individuals with anomia in order to identify different deficits and strategies used during lexical access, even though off-line data show the similar superficial behavior across patients. Studies on single word lexical processing in patients with word-finding problems could also be refined in multiple ways using priming with phonological, orthographic, morphological or semantic priming pairs in order to better understand the naming deficits observed (Royle et al., 2012; Royle & Courteau, 2013).

In 2008, Laganaro, Morand, Schwitter, Zimmermann and Schnider published an ERP study on naming in four anomic patients and controls, using delayed picture naming. Patients were tested pre and post therapy, in order to check whether specific deficit patterns and subsequent recovery could be mirrored by ERP patterns and changes in these over time. The delayed naming paradigm they used avoided movement artifacts in the ERP, while allowing for the evaluation of lexical activation in preparation for production. They asked French-speaking participants to name a series of line drawings. Behaviorally, patients showed improvement and maintained improved naming after treatment. They showed intermediate results on their ERP patterns, with normalization in the ERP signatures for the three patients with lexical-phonological difficulties but persistent deviance patterns in the patient with a lexical-semantic impairment. Further testing after six months showed additional pattern normalization in two patients with lexical-phonological difficulties in early time windows (100-300 ms after stimulus presentation) but more deviant patterns in later time windows (300-600 ms). Hemispherization changes were also observed in the patients, which might indicate the use of compensatory strategies in lexical access. This study seems to show that early automatic word (or image) detection can normalize over time but later (lexical-phonological or lexical-semantic) processes do not, despite better behavioral responses. It also appears that specific response error types (or strategies) can be reflected in the ERP profile. Unfortunately, little information is presented on the interventions that were used for the patient's lexical access difficulties.

In a follow-up study in 2009, Laganaro, Morand and Schnider tested 16 patients with anomia, half with lexical-semantic deficits and the other half with lexical-phonological ones, and controls, again using delayed picture naming. Here a more detailed analysis of differences between the two groups of patients gives added depth to their data, namely showing that the N400 component linked to lexical access and integration was reduced in lexical-semantic patients, while present in lexical-phonological ones. A later positive-going deflection was observed in lexical-phonological patients only. This later component is believed by the authors to reflect difficulties in word-form encoding. However, this does not match up with the present state of knowledge on lexical processing, carried out for the most part on unimpaired populations, where word form information precedes lexical-semantic processing (see e.g., Holcomb & Grainger, 2006; Royle et al, 2012). What this study does

imply is that it is possible to identify different anomic impairment types and response strategies in patients. However, one must note that in this study, the patients were quite variable in their post onset times (1 month to 6 years). Because normalization in patients can take 6 months to one year, and, as the previous study shows, patients pre- and post-treatment can exhibit changing ERP patterns, the data cannot be used to conclusively support neurocognitive distinctions between subtypes of anomia patients.

As we have seen throughout this chapter, many neuroimaging studies use comprehension tasks. They have the added advantage of not eliciting verbal responses in patients while targeting aspects of language that are difficult to probe in elicitation or spontaneous speech paradigms. Future studies should put more emphasis on morphosyntactic comprehension in aphasics and take advantage of cross-linguistic richness in multiple languages in order to create experiments that can assess morphosyntactic comprehension, a known domain of difficulty in patients. For example, Pourquié (2013) demonstrates that pro-drop languages are perfectly suitable for the assessment of verb inflection comprehension in aphasia. Since the pronoun or noun phrase subject is optionally phonologically realized in pro-drop languages, speakers are often forced to extract grammatical information about subjects through verb inflection *only* (e.g., the Spanish verb form: [PRO3s] *come*/ [PRO3p] *comen*, eat.3s/p 's/he eats/they eat'). In comparable English contexts, the grammatical properties of the language, i.e., obligatory overt subjects, make it unclear whether speakers distinguish singular and plural agreement through verb inflection (-s/Ø) or pronouns (*he/they*), and where patient's difficulties may lie. Hence, pro-drop languages are perfect candidates to assess morphosyntactic comprehension, as they allow the creation of tasks focused on verb inflection comprehension. Conversely, since many published studies of aphasia concern English, tasks assessing verb inflection usually investigate past tense processing because its marking is morphologically overt: e.g., *They play* vs. *They played* (e.g., Holland, Brindley, Shtyrov, Pulvermüller, Patterson, 2012). There is extensive literature on tense deficits in aphasia – and past tense processing in particular, (e.g., Bastiaanse, 2013) – reporting that individuals with agrammatic aphasia have problems producing inflected verb forms. In addition to assessing past tense processing using neuroimaging, it would also be relevant to test verb comprehension in the present tense in order to identify possible deficits not involving PAST. This would allow investigators to examine whether or not aphasic individuals show difficulties comprehending verb inflection, even in simple structures (e.g., active sentence in the present tense).

Therefore, the present chapter reiterates the need for more cross-linguistic studies and studies of multilingual speakers that would provide further insight on the neurocognitive underpinnings of impaired linguistic systems after brain damage, and rehabilitation. Indeed, as mentioned above, studies that assessed morphosyntactic comprehension in patients with aphasia concern languages that are structurally close. Given the varieties of syntactic structure configurations found across languages (Cinque & Rizzi, 2008), more cross-linguistic comparisons would be useful to further examine these innovative but preliminary findings.

Hence, a general remark we want to express through this chapter is that neuroimaging studies of aphasia should not only be neuroanatomically motivated but also linguistically and psycholinguistically driven. We have noted that neuroimaging studies on aphasia are far more concerned with neuroanatomic aspects of language recovery, i.e., neural plasticity, than by cognitive flexibility. Crosson et al. (2007) note that “clearly more attention should be focused on what are the structures that can contribute, the circumstances under which they can

contribute, how to engage those structures in the service of language rehabilitation, and how to suppress activity in structures that might interfere with optimizing language performance.” (p. 160). Here the word “structure” refers to anatomical structure.

From a more cognitive and linguistically driven approach, and in the interests of both theoretical and therapeutic perspectives, it would be of particular relevance to determine for example, which *linguistic* structures (e.g., active, passive, declarative, negative, question, embedded or not) or domains of language (e.g., lexical, morphological, syntactic, phonological, prosodic) are recoverable and which ones are not; how peripheral and core cognitive functions linked to language are impaired; whether the same type of linguistic structure is equally impaired in one language or another in multilingual patients or across languages (Menn & Obler, 1990; Gitterman, Goral & Obler, 2012); whether or not a significant relationship is identifiable between the functional nature of recovery and neuroanatomical reorganization of the brain. This opens a large program of research, which should not forget that aphasia is, in its essence, a “linguistic problem” (Jakobson, 1963) and that today, aphasiology is an interdisciplinary research field that benefits not only from cutting-edge technologies but from the combined expertise of linguists, psycholinguists and neuroscientists (Nespoulous, 1994). Finally, although most studies suggest the deployment of cognitive strategies in aphasia, there has been little characterization of these strategies in terms of linguistic and cognitive processes.

3. WHAT DOES NEUROIMAGERY ADD TO CLASSICAL BEHAVIORAL STUDIES ON LANGUAGE PROCESSING IN APHASIA?

Functional neuroimaging techniques, fMRI in particular, have been primarily used in the context of aphasiology research to study reorganization of brain-based language substrates in aphasia. More recently studies using EEG and MEG techniques attempt to measure brain activation involved in different linguistic tasks in aphasic individuals. In addition to studying language processing in patients with aphasia and to comparing it to neurotypical language processing, neuroimaging studies can be useful in determining training benefits and their impact on neural reorganization, in the context of aphasiology. For instance, Cornelissen, Laine, Tarkiainen, Järvensivu, Martin and Salmelin (2003) show that behavioral improvements were accompanied by changes in cortical dynamics in language training (re-learning) in chronic anomic patients.

Other studies have developed linguistically driven treatments. The Treatment of Underlying Forms (TUF) (Thompson & Shapiro, 2005) considers both the lexical and syntactic properties of the sentences used during treatment as well as those selected for generalization testing. An important observation emerging from their study is that training on more complex but related structures yields more wide-ranging treatment improvement than using simpler structures as a starting point. Such results have important implication for intervention. Using MEG, Faroqi-sha (2008) reports results from a study of treatment effects on recovery in 6 individuals with chronic agrammatic aphasia. The task focused on morphosyntactic comprehension. Sentences were correct (e.g., *Yesterday the teacher graded the exams*), semantically anomalous (e.g., *Yesterday the !honeybee graded the exams*) or morphologically anomalous (e.g., *Tomorrow the teacher *graded the exams*). Semantically

anomalous sentences were included as a control condition since individuals with agrammatic aphasia are known to process these sentences with high accuracy (Hagoort, Wassenaar & Brown, 2003). All participants demonstrated quantitative and qualitative changes in neural activity following therapy, and the final spatiotemporal patterns were similar to those found in neurotypical participants. According to Faroqi-sha (2008), these results demonstrate that neurophysiological changes following language therapy were specific to the linguistic process that was targeted, and not the result of general cognitive or compensatory mechanisms.

Thus, in the context of therapeutic research, the use of neuroimaging can help to measure the effect of treatment patient populations, as well as on specific language processes. Another avenue of neuroimaging research would be to study the effects of specific types of treatment on recovery (or changing) behavioral patterns in patients, and their link to normalization or maintenance of deviant ERP components. ERP studies on bilingualism have recently shown convergence on first language learner profiles by second language learner's ERPs (White, Genesee & Steinhauer, 2012), in addition to the effects of language training approaches on this process (Morgan-Short, Steinhauer, Sanz & Ullman, 2012). A research program of this type integrating therapeutic approaches should be a fruitful avenue of investigation.

In sum, studies on intervention and neuroimaging in aphasia language processing support the following claims. 1. Neuroimaging research on sentence and word processing in healthy speakers can be used as a complimentary approach to behavioral studies of aphasia, in particular for the development on neurocognitive models of language processing following brain lesions. 2. Neuroimaging studies of aphasia can help distinguish deficits and strategies, and specify the role of right hemisphere and perilesional areas (as long as MEG or fMRI are used for localization) in recovery, as well as measure treatment effects on brain activation during language processing. 3. Neuroimaging and behavioral approaches are both necessary and provide complimentary data on language deficits and processes, as they focus on different aspects of language production and comprehension: neuroimaging is not always suitable for the assessment of language production, and it cannot clearly assess the qualitative strategic aspects of recovery, while off-line language comprehension tasks can result in ambiguous results in terms of their interpretation. In fact, brain activation should not be the only matter of interest, as structures produced by patients in off-line responses to specific targets can provide us with rich information about processes and strategies used to provide linguistic outputs. Thus, an integrated approach to language processing deficits in aphasia should be pursued, not only using on-line and off-line methods for evaluation, but also with the combined knowledge of linguistics, clinical professionals such as speech language pathologists, and neuroscientists.

CONCLUSION

The classical syndrome approach of aphasia is considered to be unstable for the identification of neurocognitive underpinnings of normal language processing. Correlations between lesion areas and language impairments can be unreliable due to systematic post-lesional reorganization of the brain and high inter-individual differences in aphasic populations. However, neuroimaging allows us to examine patients as individuals or groups, and can be regarded as a complementary tool to the behavioral approach, in the context of

aphasiology, especially in view of the information they can provide regarding the times course of underlying cognitive processes. On the other hand, many challenges exist within different neuroimaging techniques for the study of normal language processing, and even more exist in aphasiology. Despite the complexities of neuroimaging experimental design, some studies are being carried out on aphasia and open a promising research pathway. Aphasiological research enriched by the development of neuroimaging addresses issues such as the differentiation between language deficits and cognitive strategies used to overcome these. Brain activation and areas involved in language recovery, and treatment effects on cognitive flexibility and brain plasticity are some of the domains that can be directly assessed using neuroimaging techniques. Since behavioral results show dissociations not observable in imaging, the classical syndrome approach should however not be abandoned or overlooked. In particular, this chapter outlines the necessity to qualify the linguistic nature of deficits and strategies in addition to illustrating them through brain imaging. As both approaches fulfill different functions and bring to the fore qualitatively different data, aphasiological research should be able to take advantage of their distinctive and complimentary benefits in further studies.

University of Montreal, Canada

Centre for Research on Brain, Language and Music, Montreal, Canada

ABSTRACT

Recent advances in neuroimaging have allowed for insight into the millisecond-by-millisecond unfolding of language processing in the brain. In particular, event-related brain potentials (ERPs), non-invasive measures of scalp-based EEG (electroencephalographic) recordings of underlying brain activity, can reflect on-line neurocognitive processes involved in linguistic processing. In this chapter we will present a review of ERP research focusing on lexical-semantic, morphosyntactic and syntactic processing during language comprehension in children with and without specific language impairment (SLI). We will highlight results important for our understanding of SLI, as well as methodological issues and challenges involved in ERP research.

INTRODUCTION

Specific Language Impairment

Specific language impairment (SLI) is a language learning impairment often described as below-normal language proficiency in the presence of preserved general cognitive development (Leonard, 1998). SLI is usually diagnosed using exclusionary diagnostics and cannot be explained as being caused by other factors such as autism, neurological impairment or linguistic deprivation (Leonard, 2003). Children with SLI have reduced vocabulary development at early ages and typically exhibit difficulty in manipulating linguistic rules of

inflection and derivation, as well as complex syntactic structures, in their native tongue. Their language comprehension is usually better than their production. Children with SLI can also present difficulties in domains such as articulation, pragmatics or even fine motor control, as well as reading and writing disorders. The study of children with SLI speaks directly to theories of language acquisition and language representation and processing, as the question arises as to what underlying problem is causing the observed language difficulties. It is not the goal of this chapter to present an extensive review of all theories of SLI. For this, we refer the reader to the seminal book by Leonard (1998) or a more recent review by Grela, Collisson, and Arthur (2013). Here we will present three hypotheses for the causes of SLI that can be empirically tested using ERPs.

A first hypothesis is that children with SLI present a general processing deficit, that is reflected in slower linguistic processing, but have relatively normal linguistic representations (e.g., Kail, 1994; Johnston, 1997; Leonard, 1998; Grela et al., 2013). The assumption here is that children with SLI have limits in their processing capacities, or a subset of general cognitive abilities, that slows down production, comprehension or language acquisition. Thus the observed difficulties in language production or comprehension are secondary to a more general cognitive processing deficit. A second hypothesis is that children with SLI have a developmental delay in language acquisition, that is they have normal linguistic and other cognitive abilities but later timing in the triggering or onset of language acquisition processes (Locke, 1994). Under this hypothesis, children with SLI should be believed to have relatively normal language acquisition abilities, but with later milestones than unimpaired children. A third hypothesis is that children with SLI have relatively intact cognitive abilities, with the exception of the grammar or specific subcomponents of grammar (e.g., Clahsen, 1989; Rice, Wexler & Cleave, 1995; Gopnik, Dalalakis, Fukuda, Fukuda, & Kehayia, 1997). In this case, general cognitive processes are not impaired in children with SLI but language-specific modules are, and in particular, productive rules of grammar such as tense marking, agreement, long-distance dependencies or other structural aspects of syntax, but also phonological and morpho-phonological rules. Various criteria are typically used to identify children with SLI in different languages (e.g., a difference between verbal and non-verbal IQ, having language scores below a certain cutoff as compared to unimpaired children, specific difficulties with sub-components of grammar, etc.). Because languages differ in their typologies and complexities, these most probably play a role in the different criteria used to identify SLI. Thus, the experimental data are based on heterogeneous groups. Because few ERP studies have even investigated language processing in SLI using ERPs, we will include all studies that we find relevant to our review while leaving it up to the reader to check the sources for a fuller description of the populations studied, and their inclusion criteria.

Event Related Potentials

ERPs are measures of voltage change patterns from scalp-recorded electrical brain activity using EEG that are time-locked to the presentation of stimuli (Luck, 2005). Differences between the ERP “components” elicited by linguistic manipulations can be used to tease apart the action of brain-based neurocognitive behavior involved in different aspects of language processing. ERP components differ in whether they are negative or positive going (polarity), their timing (onset latency), how long they last (duration), what their scalp

distribution is (topography), and whether the component peaks shift in latency (peak latency). This method has recently seen advances in the study of child language acquisition, both in impaired and neurotypical populations. Previous research has identified a number of ERP components relevant to identify and distinguish mental operations in linguistic sub-domains such as phoneme discrimination, word segmentation, prosodic and intonational phrasing, morphology, lexical semantics, syntax, discourse processing, and more.

Much of the ERP research (although not all) has focused on error-based paradigms, where a control condition (grammatical and semantically appropriate) is compared to ungrammatical, incongruous or otherwise difficult to process structures. These paradigms often use stimuli that resemble those of grammaticality judgment tasks traditionally used in behavioral research. One important feature of ERPs is that they can record ongoing sensitivity to grammatical or semantic errors across the entire utterance or sentence (measuring data points at each millisecond). This is a major advantage over traditional psycholinguistic tasks, but also online tasks such as lexical decision, self-paced reading and grammaticality judgment tasks, as the measurement is not based on a reaction time measure, linguistic output, or a judgment performed at the end of processing. In fact, grammaticality judgments are not even necessary to induce ERP effects (Royle, Drury, & Steinhauer, accepted). Rather, this method allows us to observe the unfolding of multiple domains of linguistic knowledge (phonetic, phonological, lexical, morphosyntactic, syntactic, and semantic) during the processing of linguistic stimuli. In the study of child language acquisition, a major selling point of ERPs is that you can elicit them without asking a child to perform any task. In some paradigms paying attention to the stimuli is not even necessary, although this is not usually the case for language structures involving lexical semantics and (morpho-)syntax at higher levels of processing.

Child ERPs

To date, relatively few studies have investigated ERP correlates of lexical-semantic, morphosyntactic and syntactic processing in children, and even less in SLI. Those studies that do, usually find differences between typically developing children and adults (when adults are included), but also between children with SLI and their peers, in terms of ERP latency, duration, scalp distribution or amplitude. However, as we will see below, specific patterns are influenced both by the linguistic domains studied and by age. Therefore, a good understanding of maturational effects on ERPs is necessary to understand the experimental data on SLI children. It has been suggested that linguistic and cognitive abilities in children influence their ERP patterns. Friederici (2002) links longer ERP latencies in children, as compared to adults, to slower processing speed in general. More recently Wray and Weber-fox (2013) establish a link between ERP patterns and performance on off-line cognitive and linguistic tasks in English-speaking children aged 7 to 9 years. In their study, children were divided into low- and high-normal groups on non-verbal IQ, morphosyntactic processing and word recall. Results seem to support the view that cognitive strengths (and weaknesses) might

correlate with ERP patterns⁷⁷. However, before we review the evidence on ERPs in children with and without SLI, we must first present some issues relating to their interpretation.

Methodological Issues

A number of caveats should be outlined before we move to the next section on linguistic ERP components. In particular, issues arise in child language studies that make our understanding of the data and results less than straightforward. A first challenge is to establish typical ERP profiles in normally developing children (Phillips, 2005). Few studies have focused on morphosyntactic and syntactic processing in normal language development, and the present state of knowledge is still quite sparse. Working with children also presents special challenges to the experimenter in terms of the ability of a child to do the task. In particular child participants' working memory and attentional capacities can strongly impact on language processing (see, e.g., Hildebrand, 1987 for children, and Friederici, Steinhauer, Mecklinger & Meyer, 1998 for adult ERP data). Because we still do not fully understand the impact of these factors on ERPs, especially in children, nor the interaction between these factors and language abilities, it is likely that further work on processing limitations is needed before we can fully understand their impact on child data.

Another issue linked to studies of children with language impairment is group matching with controls. Traditionally, research in language impairment will study psycholinguistic processing and clinical behavior in children with SLI and age-matched groups, in addition to language matched groups (e.g., matched on mean length of utterance, receptive vocabulary, or some other measure). In some cases, only language-matched groups are used as controls. These groups tend to be a few years younger on average than the children with SLI. However, as we shall see, the available data on brain maturation show important changes in neurotypical children's ERP profiles across different ages. It is therefore unwise to use only language-matched controls in ERP experiments, as differences observed between impaired and unimpaired groups could simply be linked to maturation effects on brain organization, and to cognitive specialization and possibly automatization.

It goes without saying that stimuli must be adapted to the linguistic abilities of children. Complex structures and late acquired vocabulary (even if of high frequency) must be avoided. This is even more critical when studying children with language impairment, as lexical representation deficits and morphosyntactic abilities might be diminished in these groups. Unless the research question is directly related to syntactic complexity, syntactic structures should be as simple as possible and controlled across conditions. For example, ungrammaticality effects in passive structures in German show adult-like ERPs starting only at the age of 7 (Hahne, Eckstein & Friederici, 2004). Another issue is the use of written versus auditory stimulus presentation. A few of the studies presented below (for the most part with neurotypical children) use written stimuli, but most prefer auditory presentation. One advantage of written presentation is that stimuli are generally much easier to prepare, as no

⁷⁷ Non-verbal IQ is linked to processing speed (indexed by earlier onset of ERP components), verbal recall is linked to resource allocation for linguistic tasks (indexed by ERP component amplitude), while morpho-syntactic abilities are linked both to processing speed (as indexed by earlier onset of syntactic components) and to resource allocation (indexed by ERP component amplitudes). Note however that the morpho-syntactic condition presents baseline issues, see Methodological Issues.

issues arise related to recording quality, splicing, avoiding intonation and other extraneous cues in the input. However, written presentation limits the lower ages at which we can test children's linguistic abilities and results from this type of study probably do not faithfully reflect true linguistic abilities in children. In addition, written presentation taxes working memory, as sentences are presented one word at a time to avoid eye-movement artifacts in the EEG recording. Children might be especially overloaded in these conditions, and children with reading disabilities, as is sometimes the case in children with SLI, even more so. However, auditory presentation also has its problems, because subtle cues as to the grammaticality of structures might be present long before the errors arise (for example, lengthening of vowels sentence-initially, intonation accent on errors or even abrupt changes in the intonation phrase when structures are spliced to create ungrammatical sentences). All of these cues are known to affect the ERP patterns and might even be the direct cause for some components that have been observed in the literature (Steinhauer & Drury, 2011).

Focusing on morphosyntactic and syntactic violation paradigms (see e.g., Friederici 2002), which are starting to be used in the study of language acquisition and SLI, a number of methodological concerns can be voiced. The two most important ones relate to how stimuli are created for ERP studies. A first issue is the nature of the errors created. Here we take two examples from Atchley, Rice, Betz, Kwasney, Sereno and Jongman (2006), but this study is by no means unique. They present agreement errors of the type '*Where *do a boy like to play?*' where the verb 'do' does not agree with the singular subject 'a boy'.⁷⁸ Note however that the sentence is not yet ungrammatical at the point where the ERP is analysed: at a. Consider the following alternative possible grammatical continuation after 'like': *Where do a boy like you and a girl like her like to play?* Other possible continuations are left up to the reader to discover. Importantly, this means that, when listening to this sentence, the point where we realize that it is ungrammatical is further downstream, at 'to'. The ERP wave elicited at 'a' is therefore not expected to reveal grammaticality effects. Another example, this time of a syntactic (structure) violation, is also taken from the same study. Here the auxiliary is deleted to create an outright structural violation as in '**Where Ø a boy like to play?*' Again, the sentence is not ungrammatical at the determiner. An alternative possible continuation would be '*Where a boy likes to play is anyone's guess*'. Again, it is only at 'to' that we can be certain of this sentence's ungrammaticality.

Other researchers create ungrammatical structures by inserting or transposing items, usually function words, as in *The scientist criticized Max's *of proof the theorem* (Neville, Nicol, Barss, Forster & Garrett, 1991), or by excluding an expected content word in a context that highly predicts it (e.g., *Die Gans wurde im gefüttert*, 'the goose was in-the fed', as compared to *Die Kuh wurde im Stall gefüttert* 'the cow was in-the barn fed', Hahne et al., 2004). In the second case, with deleted elements, it is quite difficult in fact to create outright violations. More importantly, both types of phrase structure errors also create baseline problems (see Steinhauer & Drury, 2011, for an in-depth discussion of these two issues). In ERPs, baseline corrections are used to correct for pre-target-word voltage differences (the target condition and its matched control), effectively bringing them to zero (also called *DC offset*) before the experimental manipulation. The baseline interval is a period of usually 50 to 200 ms pre-stimulus where the ERPs are 'brought together' in order to measure the 'true' effects linked to

⁷⁸ Throughout this chapter, the underlined word, here a, signals the point where the ERP was analyzed for a given condition.

the critical stimulus of interest. The assumption is that up to the target word, the two conditions are identical and that any observed differences should be linked to the psycholinguistic manipulations of the experiment. We illustrate baselining in the hypothetical situations in Figure 1.⁷⁹ In Figure 1A, a comparison between correct and incorrect conditions is made without baseline correction. What we can observe is that both conditions show early differences after stimulus presentation (0 to 300 ms), but also before it (-200 to 0 ms) and no differences in the middle time-window. When the baseline is brought back to zero (in B), to compare the specific effects of our conditions we observe that the differences now occur in the N400 time window (see below for a discussion of components).

Figure 1. Comparison of hypothetical correct (full lines) and incorrect conditions (dotted lines) without baseline correction (A) and after baseline correction (B). In C we show how unmatched conditions can impact on ERP baseline correction and early negative and late positive ERP components by pushing up the negativity in early time-windows and reducing late positivities. In D we present an illustration of what the ERP components *might* look like without baseline correction problems. Negative is plotted up and positive is plotted down.

Since we know that different words (and especially the difference between content and function words) can modulate the ERP signal (e.g., Münte, Wieringa, Weyerts, Szentkuti, Matzke & Johannes, 2001), having different types of lexical items in the baseline prior to the critical word can create DC offset effects into the ERP signal, most noticeably creating

⁷⁹ Note that following European tradition, negative ERP deflections are plotted *up* and positive ones are plotted *down*.

artifacts in the shape of stronger early negativities and smaller late positivities in the wave (1C), where the ungrammatical condition was more positive and the grammatical one more negative going in the baseline interval. Bringing these two conditions together in the baseline has the effect of pushing the ungrammatical condition into a more negative-going wave and the opposite effect for the grammatical one, thus creating an early negativity (the ELAN, see below) and reducing the amplitude of the P600. In 1D an example of how the results might look like without this DC offset effect is illustrated. Baseline correction problems are not a trivial matter and create serious issues in data interpretation.

Finally, we should note that many studies do not properly establish differences between participant groups by means of between-subjects ANOVAs. It is not sufficient to establish that one group shows a significant effect on some measure while a second does not (Nieuwenhuis, Forstmann & Wagenmakers, 2011). It is unclear to us why a number of these scientific articles do not perform direct statistical comparisons of their groups. Suffice it to say that for the reasons outlined here and above, we will often use conditional language in interpreting the available data. In the next section, we first present a review of well-known linguistic ERP components and move on to child language studies focusing on these same components. Following this we will review available ERP data on language processing in SLI.

ERP COMPONENTS AND THEIR LINGUISTIC CORRELATES

The N400: Lexical-Semantic Integration

The N400, first described in Kutas and Hillyard (1980), is a negative going wave with a central-parietal scalp distribution observed between 300 and 500 ms after stimulus presentation. It can be elicited by semantic expectancy violations, for example *He spread the warm bread with !socks/ butter* (Kutas & Federmeier, 2000). This component can be observed in bimodal (auditory-image or image-text) lexical-semantic violation conditions, where an incongruous or unexpected image is presented concurrently with an auditory or written utterance, whether it is in a noun phrase or a sentence context (Friedrich & Friederici, 2004; Willems, Özyürek, & Hagoort, 2008; Courteau, Royle, Gascon, Marquis, Drury & Steinhauer, 2013).

The LAN/P600 Complex: Grammatical Processing

Grammatical errors involving tense, gender and subject verb agreement in auditory and visual paradigms elicit left-lateralized anterior negativity (LANs) or bilateral anterior negativities (ANs) between 300 and 500 ms after stimulus presentation (Gunter, Friederici, & Schriefers, 2000; Molinaro, Barber, & Carreiras, 2011; Royle et al., accepted). These are usually followed by a later positive-going wave (P600) emerging between 500 and 1000 ms after stimulus presentation (Osterhout & Mobley, 1995)⁸⁰. Because, the P600 is elicited in

⁸⁰ Note that the P600 also appears in semantically incongruent conditions discussed in the previous section (see e.g., Holcomb, Coffey & Neville, 1992; Jutonen, Revonsuo & Lang, 1996). Jutonen and colleagues do not

many different paradigms (including those with complex syntactic structures), some have proposed that this component indexes processing load relating to syntactic integration or reanalysis, and that it is not specifically dedicated to grammatical processing (Steinhauer & Connolly, 2008). Thus the biphasic LAN/P600 complex is thought to reflect: (i) automatic morphosyntactic parsing indexed by the (L)AN, and (ii) structure integration or reanalysis indexed by the P600. Although the LAN is argued by some to be unstable and not a reliable component of morphosyntactic processing (e.g., Osterhout, McLaughlin, Kim, Greenwald & Inoue, 2004), others have argued that the P600 can be modulated by task, and is in fact more likely to reflect controlled processes than the LAN (e.g., Royle et al., accepted). In addition, these two components might appear at different stages in maturation, as we will see below. Suffice it to say that a majority of morphosyntactic ERP studies find both components for ungrammatical structures in adults. We thus review research showing both or either of these components to morphosyntactic errors.

The ELAN/P600 Complex: Syntactic Processing

Violations of syntactic structure (i.e., word category violations) also elicit biphasic waves that are often considered to be different from those found for morphosyntactic errors. Structural errors such as that found in *The scientist criticized Max's *of proof the theorem* elicit very early (often left-lateralized) anterior negativities (ELANs) between 100 and 200 ms after the target word, followed by the later P600 (Neville et al, 1991; Hahne et al., 2004). Similar to the LAN, the first negativity is thought to be an index of automatic parsing, but in this case of word category information (i.e., Noun, Verb, Preposition, etc.). A few studies of syntactic error processing have found LAN/P600 complexes rather than ELAN/P600s for this type of structural error (see a review in Friederici, 2002). An issue with a majority of the studies showing ELAN/P600 complexes to syntactic errors is that they suffer from baseline correction issues, which might be driving the ELAN effects observed (see Steinhauer & Drury, 2012). However, baseline correction problems were avoided in Hasting and Kotz (2008), who observed ELAN/P600 complexes to phrase-structure violations in two word utterances (e.g., *er kegelt* 'he bowls' vs. *er *Kegel* '*he cone (noun)').

LINGUISTIC ERPs IN CHILDREN

Lexical-semantic N400 effects similar to those in adults can be observed in early childhood. Friedrich and Friederici (2004) showed that incongruous picture-word stimuli presented to 19-month-old children elicit N400-like components. They compared semantically congruous (where the auditory name of the object *chair* matched the image CHAIR) and incongruous conditions (where the name *chair* did not match the image BALL). In the incongruous conditions, the authors observed a broadly distributed negativity over frontal and centro-parietal scalp regions between 700 and 1400 ms. This negativity is similar to the N400 observed in adults, which however starts somewhat earlier (at about 300 ms) and

observe it in children aged 5-11, while Holcomb's group demonstrates it in written and auditory ERPs with children (written: age 9-10; auditory: age 7-8) but do not discuss it in their article.

has a more focal prominence at parietal sites. Undergoing similar bimodal stimuli presentation, English-speaking children present N400 waves similar to adults in terms of latency and scalp distribution at the age of 7 years old (Cummings, Čeponienė, Dick, Saygin & Townsend, 2008). A developmental study of lexical-semantic processing in sentence contexts by Holcomb, Coffey, and Neville (1992) shows that a semantically incongruous noun (e.g., *Kids learn to read and write in !finger/school*) elicits a N400 in children as young as five years old in the auditory modality. Similar results have been found in English-speaking children aged 3 and 4 years (Silva-Pereyra, Rivera-Gaxiola & Kuhl, 2005), English-speaking children aged 8 to 13 years (*Where does a !chair/boy like to play?*)⁸¹ Atchley et al. (2006), German-speaking children between the ages of 6 and 13, using sentences such as *Das !Baby/Lineal wurde gefüttert* 'The baby/straight edge was fed' (Hahne, Eckstein & Friederici, 2004), and in French-speaking children aged 4 to 9 using sentence-visual presentation with a visual mismatch to the auditory noun (i.e., hear: *Je vois un train brun sur la table* 'I see a brown train on the table', see: [a brown SHOE on the table], Courteau et al., 2013). Thus the lexical-semantic N400 for auditory sentence processing appears at very early stages of language acquisition in visual-auditory single-word or sentence paradigms, as well as in auditory sentence paradigms. The N400 amplitude differences between control and incongruous conditions, as well as amplitude means, appear to be larger in younger children (Juottonen, Revonsuo & Lang 1996; Holcomb et al., 1992). The N400 can also be delayed (Juottonen et al., 1996), longer lasting (Hahne et al., 2004) and have wider or different scalp distributions than that which is observed in adults (Hahne et al., 2004; Juottonen et al., 1996; Holcomb et al., 1992). In the written modality, Holcomb et al. (1992) elicited the N400 for *Kids learn to read and write in !finger/school*, in the youngest group able to read (i.e., 7-8 years-old).

Morphosyntactic ERPs have also been studied in children. When grammatically incorrect sentences are presented, a late P600-like positivity is observed in children aged 3 and older but early negativities (LANs or bilateral ANs) tend to take longer to emerge, possibly being preceded by sustained and often anterior positivities. Silva-Pereyra and colleagues (2005) presented children 3 and 4 years old with sentences in which there was a clash between the auxiliary and the verb (*My uncle will *watching the movie*). In 3-year-olds, children produced a continuous, widely distributed, and sustained positivity to ungrammatical structures, lasting between 200 and 1000 ms.

In a study of French-speaking children aged 4 to 9 using visual-auditory stimuli involving determiner gender agreement errors (e.g., *Je vois *une/un soulier brun sur la table* 'I see *a.f brown.m shoe.m on the table'), Courteau et al. (2013) observed both a sustained frontal positivity and a later P600 to gender agreement errors. The later P600 is similar to that found in adult speakers, but the early frontal positivity showed the opposite polarity than that found in adults (Gascon, Lebel, Royle, Drury & Steinhauer, 2011). In an auditory study of English-speaking children aged 8 to 13-years-old, a biphasic wave pattern with latencies similar to the adult LAN/P600 was found for sentences with agreement violations (*Where *do a boy like to play?*, Atchley et al., 2006). However, these data remain difficult to interpret for the methodological reasons discussed above. In her unpublished dissertation on agreement

⁸¹ Note that these sentences are problematic, as the incongruity could appear at 'like', unless 'like' is taken to be an adjective, which would create other data interpretation difficulties. This is another problem with the Atchley et al. (2006) stimuli, as many of the sentences used contain this specific lexical item.

violations in 14- to 17-year-olds and young adults (19-23 years-old), with auditory sentences such as *Everyday, the musicians *tunes their instrument*, Meier (2008) observed late P600s, from 900 to 1400 ms in the teenagers' ERPs, while the adults' P600s occurred in the 700-1500 ms time-range. An anterior negativity found in adolescents was unreliable and none was observed in adults. However, an additional N400-like negativity was found in adolescents. This, along with the aforementioned studies, seems to indicate a developmental pattern towards a decrease in component latency and increased focalization as the child matures and less reliable effects for ANs than for the P600s. In addition, (L)ANs might change in polarity over the course of maturation. This polarity instability is observed in mismatch negativities (MMNs), termed mismatched responses (MMR) in child research, due to their instability in infants (see e.g., Morr, Shafer, Kreuzer & Kurzberg, 2002; Trainor, McFadden, Hodgson, Darragh, Barlow, Matsos & Sonnadara, 2003), and might also become more lateralized, although there is not yet any evidence for this. These data illustrate why it is important to take into account age/maturation effects in groups with wide age ranges.

In a study of case marking in German a similar pattern was identified in 4-year-olds, with a more focal distribution on central and right lateralized sites. Schipke, Friederici and Oberecker (2011) observed a positive-going wave in young German children (3-, 4-and-a-half and 6-years-old) during the auditory presentation of sentences with double-nominatives (e.g., *Der Tiger küsst *der/den Frosch* 'The-Nom tiger kisses the-Nom frog')⁸², a thematic error in German that elicits N400/P600 waves in adults (Frisch & Schlesewsky, 2005). ERPs for the three age groups were characterized first by a broadly distributed frontal negative-going wave between 300 and 700 ms after stimulus presentation. The negativity was followed by a late P600-like positive wave. This biphasic pattern was similar to the N400/P600 present in adult ERPs in equivalent conditions (Frisch & Schlesewsky, 2005), considering that N400s tend to be more broadly distributed in children than adults. However, in the same study, double-accusative violations (e.g., *Den Tiger küsst *den/der Frosch* 'The-Acc tiger kisses the-Acc frog')⁸³ do not elicit the adult-like pattern, but rather an early positivity in the youngest group, a late negativity in the 4-and-a-half year old group and a two negativities in the in the 6 year-olds (between 600–800 ms and 1300–1600 ms). The authors link ERP patterns in the double accusative condition to processing difficulties with accusative case due to its later acquisition. It thus appears that the N400/P600 complex can emerge in children, but depends on the structures studied, and most probably, the child's mastery of said structures.

Clahsen, Lück and Hahne (2007), observe no positivity similar to the P600 in younger children (aged 6 to 7 years) when they are presented with plural overregularization errors in German (e.g., *Ein Kran belädt die grossen *Waggonen/Waggons im Hafen* 'A crane is loading the large wagons in the harbour'). A broadly distributed N400-like negativity is observed for these errors until the age of 8 when a biphasic wave — a negativity in anterior sites followed by a late P600 in the occipital region at 1000 ms — is seen. By the ages of 11 to 12 year old, a biphasic LAN/P600 pattern similar in distribution to adults is found, but with a longer latency in the P600. It thus appears, that ERPs for different types of errors within the same language (here overregularization versus case-marking errors in German) might show different emergence and refinement patterns.

⁸² Nominative case denotes subjects in German. The direct object of the verb should be in the accusative case.

⁸³ Accusative case denotes direct objects in German. One of the nouns should bear nominative case for subjecthood.

Syntactic ERPs have been sparsely researched in children. In the study by Atchley et al. (2006) discussed above, the condition with auxiliary drop (*Where *Ø a boy like to play?*) was used to study syntactic processing. This condition results in a biphasic pattern similar to that for morphosyntactic errors, i.e., a LAN/P600 complex in English children aged 8 to 13. Using a word deletion paradigm (e.g., *Die Gans wurde im Ø *gefütert* 'the goose was in-the fed'), Hahne, Eckstein and Friederici (2004) studied syntactic processing in German speaking children aged 6 to 13. All the groups except the six year olds showed the ELAN/P600 complex to ungrammatical structures, with older children showing earlier onset of the P600, similar to adults. The six-year-old group also showed a small P600, but this was preceded by an early positivity. However a previous study by Oberecker, Friedrich and Friederici (2005) observed a delayed ELAN in two-year-olds. Similarly to the data for morphosyntactic processing, these studies seem to indicate a process of maturation for syntactic processes, with late positivities emerging at young ages and showing earlier latencies with advancing age, while early negativities appear only around or after age 6. However, for methodological reasons discussed previously (mainly baseline correction problems, but in the case of Atchley et al. (2006) the additional absence of group comparisons), these data remain inconclusive.

Based on this short review, it appears that, at very young ages, children and adults show globally similar ERP components for lexical-semantic but not morphosyntactic and syntactic processing. Adult-like morphosyntactic and syntactic ERPs seem to emerge at different ages depending on the structures studied and the input modality (auditory or written). At the present time, it is unclear which morphosyntactic abilities mature earlier than others, as tasks on different grammatical processing domains (verb agreement, gender agreement, case and plural marking) have been undertaken in different languages. It could also be that the same linguistic process (e.g., agreement) matures at various time points in different languages, simply due to the variety in complexity, structures, or idiosyncrasy of the processes involved. However, the use of ERPs to study child language development is clearly motivated by the fact that some of the innovative studies presented above have provided data that shows, on the one hand, that ERPs can reflect lexical-semantic, morphosyntactic and syntactic processing in children, and on the other hand, that ERPs are sensitive to changes in the neurocognitive mechanisms underlying these processes. Based on these facts, we can extend the study of neurolinguistic processing using ERPs to children with SLI, in order to better understand the cognitive processes underlying their language difficulties.

If children with SLI replicate patterns found in unimpaired children we would expect to observe N400s on lexical-semantic violations at very young ages, while morphosyntactic, thematic role, and syntactic errors would show developmental trends on LAN/P600, N400/P600 and ELAN/P600 components, similar to their unimpaired peers. However, if children with SLI use different cognitive processes to acquire and process language, we would expect ungrammatical and semantically incongruous structures to elicit a number of diverging patterns. Based on the theories of SLI outlined above, we could expect children with language learning disorders to present one of the following patterns.

- 1) If children with SLI manifest general slowing in processing but normal patterns in their linguistic development, they should show normal ERP patterns with longer onset and offset latencies than unimpaired children. A possible outcome is that the timing of ERP

components should be slower. Another is that slowing in early components could block later ones from emerging.⁸⁴

- 2) If children with SLI manifest a delay in acquisition but normal pattern in their linguistic development, they should show similar ERP patterns but at later ages than those observed in unimpaired children. That is, their ERP signatures should be ‘immature’ as compared to age-matched peers, but similar to younger controls.
- 3) If children with SLI manifest deviance or difference in their linguistic development, they should show different or deviant ERP patterns from controls at all ages. These different patterns would signal the use of compensatory or alternative cognitive mechanisms for language processing.

Note that it is possible that children show one of these patterns in one specific linguistic domain (say lexical-semantic processing), but a different pattern in another (for example morphosyntactic processing). ERPs can allow us to tease these apart. It therefore seems that ERPs are a useful tool for the study of language processing in children with SLI, as we would expect processing difficulties to be reflected in their ERP components. Bearing this in mind, we now present a review of ERP studies involving children with SLI that focus on the domains of lexical-semantic, morphosyntactic and syntactic processing. We will present the studies and results by linguistic domain, as some issues with methodology and data interpretation are relevant only to certain paradigms.

ERP STUDIES INVOLVING CHILDREN WITH SLI

Lexical-Semantic Processing in SLI

Available evidence on lexical-semantic processing of isolated nouns or within sentences tends to show a developmental pattern whereby younger children with SLI (or at risk for language impairment) show reduced N400s for lexical-semantic anomalies or other lexical-semantic incongruencies, while older adolescents show pattern normalization. A number of the studies reviewed here compare lexical-semantic to syntactic or morpho-syntactic processing in children with SLI. In this section we refer only to data on lexical-semantic processing and will return to other aspects of grammatical processing in the following sections.

Friedrich and Friederici (2006) investigated lexical-semantic processing in very young children with and without a risk for language impairment. They observed that the absence of an N400 at 19 months was a predictor of weaker language abilities at 30 months. They selected forty children from a previous study (Friedrich & Friederici, 2004) who had been further evaluated on expressive and comprehensive language abilities at a later age (30 months). Two groups of children were established, with one ($n = 18$) being at risk for language delay. Retrospective analyses of the ERP components obtained at 19 months show a strong and broadly distributed early positive component (starting at 150 ms) to lexical-semantic incongruencies in the at-risk group, while the second group showed a typical N400

⁸⁴ This would be a cascade effect in the ERPs whereby an early process (say phonological encoding) is slowed down, causing a later one (say morphosyntax) to be slower to unfold, or even causing it to be unable to operate.

preceded by a small early frontal positivity. According to these authors, the absence of an N400 at 19 months would predict language delay or language impairment. Sadly, no follow up study was undertaken to establish the existence of language impairment in the at-risk children at later ages.

Older children with a confirmed diagnosis of SLI show longer latencies for the lexical-semantic N400, as compared to controls. Cummings and Čeponienė (2010) presented bimodal stimuli to 16 children with SLI aged 7-15 years. Using visual-auditory presentation of images (e.g., ROOSTER) with verbs (the lexical condition, e.g., *crowing*) or environmental sounds (e.g., a rooster crowing)⁸⁵ they observed that children with SLI show longer latencies on the N400 to lexical incongruencies as compared to controls, whereas both groups show similar latencies on environmental sound N400s. Because these effects are not found with environmental sound-word pairings in children with SLI, the authors conclude that the observed integration difficulties are specific to the lexical-semantic domain. However, these data are not strongly supported by the statistical analyses on group effects and interactions with stimuli types (differences between environmental sounds and lexical N400s were about 27 ms longer in the SLI group, but amplitudes and distributions were astonishingly similar, as can be seen in their ERP waves).

Studies of lexical-semantic processing in older children tend to find differences between children with SLI and their peers at relatively younger ages but not older ones. Sabisch, Hahne, Glass, von Suchodoletz and Friederici (2006), do not observe any (late or early) N400s to lexical-semantic anomalies in sentences containing incongruous verbs (e.g., *!Der Vulkan/Das Brot wurde gegessen*, 'The volcano/bread was eaten') in 16 German children with SLI aged 9-and-a-half on average. N400 amplitudes were also correlated with verbal short-term memory measures. However both children with SLI and controls show similar later P600s to these same errors. Sabisch and colleagues interpret the differences in the N400s as an indication of difficult lexical integration for verbs in SLI children. However, the additional computation linked to passive structures used in this study, and known to be difficult for children with SLI (van der Lely, 2005), could also have played a role. In her unpublished dissertation, Betz (2005) studied preteens (aged 11-13) and teenagers with SLI (aged 13-14) as well as teenager and adult controls, on lexical-semantic processing of sentences from Atchley et al. (2006), that is sentences of the type *Where does a !chair/boy like to play?*⁸⁶ Because the younger SLI group made unstable grammaticality judgments, only the older group was included in statistical analyses. All groups showed a relative negativity to semantic incongruencies, with no significant interactions between groups. Fonteneau and van der Lely (2008) studied lexical-semantic processing in teenagers and adults (aged 10-21 years) with G-SLI (Grammatical SLI, a subgroup of patients with difficulties specific to grammar processing, van der Lely, 2005) compared to language matched, aged-matched and adult controls. Sentences containing semantic anomalies (e.g., *Barbie bakes the !people/bread in the kitchen*) resulted in similar N400 patterns in all groups, with slightly different scalp distributions (more right lateralized) in younger language matched-controls. Weber-Fox, Leonard, Wray, and Tomblin (2010) studied lexical-semantic processing in teenagers with SLI and controls (aged 14-18), using sentences such as *Every day, the children !rust/pre tend*

⁸⁵ Note that the items were not matched across lists for length either in terms of "syllables" or duration.

⁸⁶ See footnote 5.

to be super-heroes. No statistical difference was observed between participant groups on the N400 elicited by the semantically anomalous verb.

In the written modality, similar data are found. An early study of visual sentence processing by Neville, Coffey, Holcomb, and Tallal (1993) investigated sentence final incongruous nouns (e.g., *Giraffes have long !scissors/necks*) in nine-year old children with SLI and concurrent reading disorders, as compared to age-matched controls. Both groups showed the N400 for anomalous sentences with a tendency toward larger and more delayed components for the SLI group. Only the delay difference was significant in the between-group analyses. Another set of data from this same study shows that children with SLI showed larger N400s than controls to both open and closed class words. Finally, in a series of recent unpublished studies of visual lexical decision on single words using ERPs, Sizemore and colleagues show that English-speaking adolescents with SLI (aged 15 years) are less sensitive to word frequency than controls: that is they do not show modulation of the N400 by frequency (Sizemore, Evans & Hughes, 2009)⁸⁷. In addition, in the SLI group, N400 effects might be correlated with non-word repetition abilities and receptive and expressive vocabulary scores, while it correlates only with receptive vocabulary scores in controls (Sizemore & Evans 2012). Unfortunately, these conference presentations have not yet been published as complete studies, and are difficult to evaluate in their present form. The majority of studies on lexical-semantic processing thus argue for a delay-with-normalization picture for the development of lexical-semantic processing in SLI. However, more subtle difficulties in lexical-semantic processing might still be present, as signaled by Sizemore's research.

Morphosyntactic Processing in SLI

Based on a limited set of experiments on morphosyntactic processing in SLI, it appears that ERPs might differ in children with SLI as compared to their peers. However, the available data is contradictory. Betz (2005) studied ERP responses to agreement errors (e.g., *Where *do a boy like to play?*, from Atchley et al., 2006) in teenagers 15-16 years old. While adults show a P600-like positivity to these "errors", none of the adolescents (SLI or control) show significant effects. However, the SLI group does show a trend, with an observable P600 in one parietal electrode (Pz). Again, for methodological reasons we discussed above, these data are inconclusive. More recently, Weber-Fox, Leonard, Wray, and Tomblin (2010) studied subject-verb agreement processing in teenagers with SLI (e.g., *Every day, the children *pretends/pretend to be super-heroes*). They observe a right anterior negativity (RAN) in both control and SLI groups, and a reduced P600 in the SLI group as compared to controls. This astonishing (and counter-intuitive) piece of data could be interpreted as meaning that automatic feature checking (as indexed by RANs) is intact, but that later integration and reanalysis processes (as indexed by reduced P600s) are impaired in SLI. To sum up, the studies reviewed show reduced or absent P600s to verb agreement errors in adolescents with SLI as compared to controls, but the Weber-Fox group also shows robust early negativities

⁸⁷ See Kutas & Federmeier (2011) for a review of N400 modulation by different factors including lexical status and frequency.

which are usually interpreted as automatic detection of grammatical errors. The data thus seems to support, in part, deviance or difference⁸⁸ in processing abilities in children with SLI.

Syntactic Processing in SLI

As with morposyntactic studies, the data on syntactic processing in SLI is still quite tenuous, because only a small number of ERP studies have probed these questions in children and adolescents with SLI, and most suffer from baseline correction issues. Many studies presented here were discussed in the above section on semantic processing, where information on age groups and controls is provided. Betz (2005), used *do*-omission structures from Atchley et al. (2006, e.g., *Where *Ø a boy like to play?*) to study syntactic processing in her teenage groups. All participants show a P600 to these “errors” with a later onset, larger amplitude and broader scalp distribution for the teenaged SLI group, which the author interprets as indicating later component maturation in SLI. Fonteneau and van der Lely (2008) studied syntactic processing in their four groups using sentences such as: *Who did Barbie push the clown into the *wall?* (as compared to *What did Barbie push the clown into?*)⁸⁹. They found group differences in the ERP patterns to ungrammatical structures, with LAN/P600 complexes in all participants except the G-SLI one, which showed a P600 followed by a late negativity. However, these data are astonishing, as the stimuli used should have elicited thematic-role N400/P600 biphasic waves (e.g., Friederici & Frisch, 2000; Frisch & Schlesewsky, 2005) rather than the ELAN/P600 complex. Moreover, at the point where the data are analyzed (i.e., *clown*) the sentences were not yet ungrammatical (consider *Who did Barbie push the clown into?*).

In addition to their study of lexical-semantic processing, Sabisch and colleagues (2009) probed sensitivity to syntactic errors to word-category violations in German children. In their syntactic condition (e.g., *Der Stock wurde ins *geworfen*, ‘The stick was in-the *thrown’, in comparison to *Der Stein wurde ins Wasser geworfen* ‘The Stone was in the water thrown’), results showed a biphasic pattern linked to syntactic structural errors (ELAN/P600, with the AN being in fact bilateral and sustained over 1500 ms) in typical children, while the group with SLI showed a reduced LAN becoming significant between 700 to 1000 ms, followed by a P600. The second component was more largely distributed over the scalp, as well as having longer onset and offset latencies, than in controls. However, differences between groups on both components are not strongly supported by the statistical analyses, as interactions with group were either marginal or not present in certain contrasts. Again, for methodological reasons discussed at the beginning of this chapter (mainly ERP baseline correction problems, but also the fact that these structures are not properly ungrammatical, e.g., one could say *Der Stock wurde ins geworfen wirkende Stroh befördert*. ‘The stick was in-the apparently thrown

⁸⁸ Since a majority of studies indicate that younger children tend to show similar, more distributed, or larger P600s than adults, smaller P600s are not interpreted here as a delay in language development abilities. However, further research might modify this picture.

⁸⁹ It is not clear whether the authors directly compared these two conditions, because they were in two different lists, and each participant heard only one list. Within the list, the control sentence was *Who did Alice in Wonderland push the ball into?*, which poses problems, as the subject noun phrases differ significantly in length (and most probably in frequency) in the two sentences, and might have an effect on the downstream ERP (including the baseline). In addition the design compares two different target words, where frequency, animacy and other factors might also influence ERP responses.

straw moved', and possibly, interference from prosodic effects due to splicing, Steinhauer & Drury, 2012), these data remain inconclusive.

In a study of grammatical subject and object Wh-question processing (e.g., *Who_i t_i kissed the hippo?* and *Who_i did the hippo kiss t_i?*)⁹⁰ in 13 English-speaking children with SLI and 17 controls with an average age of 9, as well as 18 adults, Tropper, Hestvik, Shafer and Schwartz (2008) expected to show reduced sustained anterior negativities to object questions in children with SLI. These sustained negativities are linked to increased memory load in complex sentence structure processing (see e.g., Ruchkin, Johnson, Grafman, Canoune & Ritter, 1992; Friederici et al., 1998). While adults showed sustained negativities to object questions, typical children exhibited sustained positivities, and children with SLI showed similar but reduced positivities. However, no statistically significant differences were found between the two groups of children. (In a concurrent offline task, SLI children were at chance when judging these sentences for grammaticality.) However, the authors did not control for working memory abilities in their participants, thus introducing a confound in their design. In the same experiment, sentences preceding the ones with Wh-questions (with filled gaps, such as 'the camel' in *The zebra that the hippo kissed *[the camel] on the nose ran far away.*⁹¹ as compared to adjunct structures like *The weekend that the hippo kissed [the camel] on the nose he ran far away*), were also presented to the children (Hestvik, Epstein, Shafer & Schwartz, submitted). Note, however that the filled-gap sentence is not ungrammatical at 'the' (consider *The zebra that the hippo kissed the other day...*). Control children elicit a bilateral AN at the filled gap between 0-200 ms and reappearing as a RAN at 500-600 ms, while children with SLI show late posterior negativities to this condition between 500-700 ms. The authors interpret this result as indicating a delay in grammatical processing in children with SLI. This interpretation does not consider the fact that the components in both groups are of a different nature (i.e., a posterior negativity in contrast to the RAN). If only a delay in processing was being observed, we would expect to observe the same types of components with different timing in both groups.

DISCUSSION

As mentioned above, lexical-semantic processing seems to show delay or difference in younger children with SLI, but also appears to normalize with age, at least in part. Because young children with SLI tend to have reduced vocabularies as compared to their peers, the data on word recognition for very young children is not astonishing. However, it also appears that older children with SLI can process lexical semantics in ways similar to their peers. The ability to process lexical items might be modulated by phonological processing or mnesic abilities in children with SLI (Sizemore et al, 2009; Sizemore & Evans, 2012). These data seem to indicate that if studies on lexical access in SLI factor in psycholinguistic properties that are known to correlate with language difficulties (for example, phonological,

⁹⁰ Indices indicate where the Wh-word has moved from in the underlying structure. Object questions such as *Who_i did the hippo kiss t_i* are known to cause processing difficulties typical in adults and children, and are hypothesised to be more difficult to process because of the long distance between the underlying syntactic position of the Wh-word and it's surface position.

⁹¹ Here the sentence is ungrammatical because 'the zebra' is the direct object of 'kissed', and the gap left by its movement to the head of the sentence cannot be filled with another complement, such as 'the camel'.

morphological or semantic knowledge) we could beneficially use relatively simple ERP paradigms for the study of SLI. For example, priming studies on lexical access are a traditional approach to these questions and could be a useful approach to the study of lexical access in SLI (see Royle, Jarema & Kehayia, 2002, for a classic priming study with teenagers and adults with SLI). A number of ERP studies have fruitfully adapted primed lexical decision to brain imaging (see, Royle Drury, Bourguignon & Steinhauer, 2012, and references therein). This approach would allow for a better understanding of specific difficulties in lexical processing in subgroups of children with SLI (e.g., children with phonological disorders, or semantic pragmatic difficulties). Note that research on word recognition has shown that, in gating tasks, children with SLI do not differ from controls when recognizing frequent real words but do so only when they are required to recognize non-words (Dollaghan, 1998; Montgomery, 1999). Dollaghan (1998) interprets this as showing that word comprehension difficulties in children with SLI are related to lexical status. At present, most ERP research on auditory processing in children with SLI has not focused on words but rather on segments (phonemes and syllables), in conjunction with ERP components that have not been reviewed here. Further studies are needed to improve our understanding of lexical processing in these children. Studies should also be aware that sentences such as *Giraffes have long !scissors/necks* can elicit phonological mismatch negativities (PMN) whether the task is written or oral (Connolly & Phillips, 1994; Newman, Connolly, Service & McIvor, 2003). The PMN is linked to the expectation that the sentence final word is 'neck' and the initial letter or phoneme (in 'scissors') mismatches this expectation. The PMN can overlap with the N400 in the ERP wave (Connolly & Phillips, 1994) and care must be taken not to confuse lexical-semantic processing difficulties with phonological ones.

There is still too few data on morphosyntactic processing using ERP techniques to positively conclude whether children with SLI show differences or delay in this type of processing. Interestingly, Weber-Fox et al. (2010) show apparently normal RANs followed by reduced P600s to subject-verb agreement errors. We could interpret these data as showing normal automatic agreement processing, but difficult controlled reanalysis and integration. Because only one study has presented interpretable data on the question, we must remain cautious with this explanation. However, processing of grammatical errors is a potentially rich area for research with children with SLI. Because these paradigms usually do not suffer from ERP baseline correction issues, their development should be straightforward in both written and auditory modalities.

One question the reader might ask is why do we observe P600 in morphosyntactic conditions that are not truly ungrammatical in teenagers with SLI (e.g., in Betz, 2005). As discussed in the introduction section, P600s can be elicited by hard-to process (e.g., passive) or garden path structures, as well as semantic incongruencies. Thus the appearance of a given ERP wave does not necessarily mean that we are measuring what we think we are, and these P600s could be linked to a number of other processing difficulties, which remain to be defined and studied.

Our review of the available studies of syntactic processing in children and teenagers with SLI leaves us with few interpretable data sets, mainly due to ERP baseline correction problems. It is clear that differences in processing are being revealed, but it is unclear what most of these studies are truly tapping. Data from Tropper et al. (2008) on Wh-questions could be interpreted as support for a hypothesis of syntactic processing difficulties in children with SLI, however, because they do not control for working memory abilities in their groups,

this interpretation remains tenuous. Thus, new avenues of research in syntactic processing for SLI, and for children in general, need to be refined and run for us to gain a better understanding of neurocognitive processes underlying syntax in children with and without SLI. In particular, paradigms that avoid baseline correction problems should be developed (Steinhauer & Drury, 2012).

CONCLUSION

In this chapter, we reviewed a number of innovative research using ERPs with children and showed that ERPs are a useful tool for the understanding of normal and impaired language processing in children and adolescents. We observed that research on lexical-semantic processing has provided some insights into language processing in children with SLI. The data seems to support a pattern of delay followed by normalization in lexical-semantic processing. However, research on morphosyntactic processing is lacking, and research on syntax is at present mostly uninterpretable. Promising avenues of research have been suggested. In particular, lexical-semantic (and lexical-phonological as well as lexical-morphological) processing can be studied using classic lexical decision, naming and priming tasks in conjunction with ERP methods. In addition, lexical-semantic processing within sentences, as has been undertaken with adults and a small number of children studies, is also a promising avenue. Furthermore, research on morphosyntactic processing can easily be developed, as paradigms already used in language acquisition research can be adapted to ERP techniques (e.g., Courteau et al., 2013), as long as one pays careful attention to avoid methodological issues outlined above. Syntactic processing is harder to study, because of the difficulties in developing balanced designs where ungrammatical and control conditions differ only at the critical onset of the structural error. However, this is not an impossible task and would certainly shed light on (dis)abilities in sentence processing in children with SLI. Another avenue of research is to study grammatical, rather than ungrammatical, sentence processing, as Tropper et al. (2008) do. In their study, grammatical structures (e.g., *Who_i t_i kissed the hippo?* and *Who_i did the hippo kiss t_i?*) are compared in terms of processing load. The development of this type of paradigm holds the potential to highlight similarities and differences in normal sentence processing in children with SLI.

However, future research must involve sound designs. There serious issues with psycholinguistic designs used in some of the existing experiments reviewed, either in terms of the stimuli themselves or in terms of identifying the point in time when the incongruity or ungrammaticality appears in the sound stream or the text, need to be addressed. A recurring problem when adapting traditional psycholinguistic sentence stimuli for ERP experiments is the question of when exactly a sentence becomes ungrammatical. When looking at the sentence from a dynamic versus a static perspective, it quickly becomes apparent that some structures can be ‘rescued’ (or are in fact not ungrammatical) where they are expected to be. This has to be taken into consideration when developing designs for the on-line study of language processing. Interdisciplinary ERP research should always involve teams including experienced ERP scientists, to avoid erroneous critical timing for data recording and artifactual data interpretation, as well as language professionals (linguists and

psycholinguists) to ensure that experimental designs are appropriate for the experimental questions addressed and the populations studied.

Chapter 53

ANALYZING LANGUAGE USE OF LEARNERS WITH LEARNING DIFFICULTIES AND DISABILITIES WITH REGARD TO CHALLENGING BEHAVIOR

Larry L. Lee*

Behavioral Assessment and Intervention Team
Derwen College, Oswestry, UK

ABSTRACT

Concerned about traditional practice with respect to challenging behaviors of learners with learning difficulties and disabilities (LLDD) in the UK, I questioned the extent to which they could manage themselves. From 265 LLDD, I invited 15 male learners, median age of 19, to participate in 12 weekly 1 hour discussions in sense-making groups specific to the challenging behavior of 3 case study LLDD who were drawn from the 15, as well as in 12 weekly 1 hour interviews that addressed behaviors recorded by practitioners (someone who works within a particular paradigm of care and education) as challenging. Thematic analysis yielded 5 themes related to different versions of LLDD either acting responsibly (handing their problems over to practitioners) or irresponsibly (deliberately disrupting learning and social environments), categorized as *I've got a problem, I told staff, I can't, I'm disabled* and *I'm not normal*. Discursive analysis highlighted 5 variable communicative and behavior patterns, *Conditioned-Response, Role Specific, Inner-Conflicted, Retreating* and *Higher Order*, which correlated with LLDD levels of differentiation from various adverse sources of influence on their identities. Despite these influences, when invited to engage non-defensively, LLDD proved able to manage themselves.

* Corresponding Author: Dr. Larry L. Lee, Team Leader.

INTRODUCTION

After accepting a post at a specialist college that promotes educational, vocational, personal and social development for learners with learning difficulties and disabilities (LLDD), I became conflicted when directed by my line-manager to manage their challenging behavior. I questioned, firstly, whether it was even ethical to position myself to engage LLDD on this basis. I questioned, secondly, the appropriateness of my professional worth being predicated on how LLDD conduct themselves in learning and social environments as such practice could compromise my professionalism, giving power, whether intentionally or not, to LLDD. I questioned, thirdly, why some practitioners generally accept LLDD cannot manage themselves.

Drawing on LLDD accounts from discussions in sense-making groups and 1-to-1 semi-structured interviews, this chapter highlights their capacity to organise, interpret and re-organise meanings they assign to their construction of challenging behaviour and, using a case study example, evidences the capacity of a LLDD to manage his challenging behaviour in learning and social environments. Considering the focus of this chapter, it is necessary to highlight current views on what challenging behaviour is and how it should be treated.

The literature illustrates one of the central contentions considered in this chapter; namely, the close and / or constitutive relationship between theory and practice and how these planes of influence converge to formalise learning disability narratives LLDD draw on to make sense of being in learning and social environments. Whilst this claim might generally be true, a short review of literature highlighted this in particular. Theory frames how certain practitioners view phenomena and this, in turn, influences how practitioners practice. Of course the relationship between theory and practice could be flexible, but practice is more interpretive and theory generally imposes certain limitations on practice.

An example of what is meant here could be found in a sociological perspective on blindness and / or any other disability as either might conclude the main problem is one of social isolation. Some practitioners, in response to this particular problem, might focus on reducing this isolation (e.g., better housing, transport links, education etc.). Other practitioners, those grounded in biological or medical understandings of the problem, might direct their practice toward improving sight via technical advances (e.g., implants). In reality, theories and practitioners who apply their understanding of them to situations like for example challenging behaviour, converge in a way that sustains their epistemological and ontological understanding. In this short section, this suggested link is illustrated principally from a psychological point of view.

In recent years there has been a plethora of literature around challenging behaviour that focuses primarily on how it is defined and how practitioners might respond to it when or if it occurs in learning and social environments. In this section, many of these views are critically discussed and evaluated within a theory of Social Role Valorisation framework (Wolfensberger, 1972 and Lemay, 1995). Closely linked to the principle of normalisation elaborated below, SRV is grounded in an assumption that society identifies groups of people as fundamentally different or 'abnormal'; such groups are implicitly viewed as being of less value than others in society; SRV also highlights methods used to facilitate this devaluation (Swain and French, 2008; Repper and Perkins, 2003 and Brown, 1973). Having established parameters for this critical discussion and evaluation, challenging behaviour has been defined

in a number of ways in the literature, yet, Emerson's seminal definition represents the standard:

"Cultural abnormal behaviour(s) of such intensity, frequency and / or duration that they endanger the physical safety of the student [my emphasis applied] or others is likely to be placed in serious jeopardy, or behaviour which is likely to seriously limit use of, or result in the person being denied access to, ordinary community facilities" (Emerson, 1995; p. 4).

First introduced in the United States by The Association for People with Severe Handicaps (Emerson, 1985; Emerson and Einfeld, 2011), challenging behaviour is deemed a descriptive term that is considered less stigmatising than more outdated labels commonly used prior to the 1980's (e.g., feeble-minded, sub-normal, abnormal, aberrant, disordered, disturbed, dysfunctional, maladaptive and problem behaviours). Emerson's definition, which includes four subject areas, is used to structure this review; namely, physical safety, cultural abnormality, limited use of services and potential of being cut-off from the wider community. Whilst most of this short review focuses on challenging behaviour as culturally abnormal, the issue of safety, limited access to resources and isolation from the wider community is explored first.

PHYSICAL SAFETY

Similar to historical events that aligned in a way that resulted in the mad being institutionalised (Arnold, 2008; Porter, 2002 and Shorter, 1997), the issue of physical safety shapes discourse on challenging behaviour because of a potential risk of injury to LLDD and / or others in various learning and social environments. Examples of these behaviours include violence toward others, self injury and reckless disregard for safety that could entail a LLDD wandering across the street.

When confronted with behaviours deemed to make learning difficult if not impossible, some practitioners might decide their duty of care necessitates restricting a LLDD's range of movement via physical restraint; whilst such actions could be helpful in certain situations, use of restraints is problematic for a number of reasons: this practice could result in injuries to practitioners and / or LLDD (Allen, D. et al., 2003; Blackburn, R. 2006; Bird, F. et al., 1989 and Hill and Spreat, 1987); unplanned restraints could lead to psychological stress for practitioners and LLDD (Emerson and Einfeld, 2011); Additionally, use of restraints in certain situations could be deemed unlawful or lead to various forms of abuse (Albrecht, 1992; Lyon, 1994 a and b). Inappropriate use of restraint could have result in an escalation in challenging behaviour (McDonnell, 2002); this type of practice might have been used in situations wherein other methods could have been more effective (Oliver, 1987) and use of restraint could have impeded on a LLDD's right to respect and dignity (Mental Capacity Act, 2005); yet, irrespective of these legitimate concerns, a reasonable argument could be made for use of restraints if LLDD's challenging behaviour represents a danger to themselves and / or others in learning and social environments.

Three broad categories of physical restraints appeared evidenced in the literature (Emerson, E. 2003): Direct physical contact between practitioners and LLDD; this could

include using manual guidance like holding a LLDD's hand to prevent movement and / or holding a LLDD's arms and legs to prevent h/her from attacking someone; use of barriers such as locked doors to limit freedom of movements; examples of this might include placing bolts / catches beyond the reach of LLDD and / or strategically locating physical objects and utilisation of material and / or equipment that could restrict or prevent movement of LLDD; examples of this might include strapping a learner into a wheel chair; requiring a learner to wear a helmet to reduce effects of head-banging and / or placing splints on a learner's arm to restrict h/her movement. Given potential for various forms of abuse, together with other concerns highlighted above, practitioners working with LLDD's whose challenging behaviours might warrant restraint, requires a formal policy that encourages sound judgments whenever such interventions are deemed necessary. A policy could establish clear parameters that specify minimum acceptable standards of good practice that could be grounded in a low arousal approach; the literature suggest this method is indicative of best practice (Allen, D., 2001 and McDonnell, 2009).

LIMITED ACCESS TO RESOURCES

Prior to the emergence of a critique of a 'top-down' social model of disability (Shakespeare and Watson, 1997; Barnes and Mercer, 2003), LLDD, under auspices of a medical model of disability (Emeron and Einfeld, 2011; Campbell and Oliver, 1996 and Foucault, 1977;), were diagnosed as biologically subnormal; as such, they represented an educational and social problem that results in them having limited access to resources generally available to normal members of society.

Many, because of their disability, cannot access resources such as schools, public transport or health services.

Initially confined to institutions such as workhouses and / or asylums, more modern methods of segregation include the establishment of special schools and colleges. Establishment of these institutions is dealt with more fully in the literature, but the idea that LLDD [my emphasis applied] are able to articulate their own needs rather than being fitted into social or medical models has been a claim, by disabled people, for greater access to resources including political power.

Nevertheless, challenging behaviour might result as a consequence of LLDD being socially and educationally isolated; this, of course, could also lead to even more limited access to resources in the community in which h/she lives.

LIMITED ACCESS TO COMMUNITY

Establishment of prisons and asylums in the 18th, 19th and 20th centuries to house criminals, mentally ill and feeble-minded is outlined elsewhere in the literature, but such institutions served to isolate these people from wider society (French et al., 1993 and Foucault, 1976). These actions were based on theories of contagion; it was thought mental illness could be spread through a population (Szasz, 1972 and Foucault, 1989). Viewed as not normal, LLDD [my emphasis applied] were driven out of local communities because they

were considered less productive and of less value than more able bodied people. Even with the rise of a more generous and benevolent outlook in more modern times, special schools illustrate a continuation of practice that limit LLDD access to the wider community; this, of course, could be understood in relation to the normalisation principle, initially, articulated by Bengt Nirje and further developed by Wolfensberger via the National Institute of Mental Retardation during the 70's (Nirje, 1969 and Wolfensberger, 1972). The aim of this principle is to make available to LLDD patterns and conditions of everyday living which approximated to regular circumstances and ways of life available to other members of society; specifically, housing, schooling, employment, exercise, recreation and freedom of choice (Nirje, 1969; Wolfensberger, 1972 and Emerson and Einfeld, 2011)).

Whilst this level of inclusion remains a lofty aim that informs recent disability policy in the United Kingdom (Disability Discrimination Act, 1995; Mental Capacity Act, 2005; Disability Discrimination Act, 2005 and Protection of Vulnerable Adults Act, 2000), continued use of labels like challenging behaviour could result in practitioners focusing on deficits and dyfunctions of LLDD; whether intentional or unintentional, this type of practice could result in their access to the community being prescribed and proscribed. Whilst debate over the value of 'special' schools versus a more integrated approach, where all, irrespective of disability, learn together continues today, the move towards inclusion has raised the professional profile of challenging behaviour.

CULTURALLY ABNORMAL

Practitioners in mental health and educational circles, following an introduction of a more inclusive approach to LLDD [my emphasis applied] as a group, to express concerns about a particular problem; namely, challenging behaviours (Emerson and Einfeld, 2011; Mansell Report, 2007; Emerson, 2003, 1987 and 1986 and Emerson et al. 1987); they worry learners formerly accustomed to more institutionalised settings might display culturally abnormal and / or disruptive behaviours in learning and social environments; thus, making learning difficult if not impossible for everyone (Arnold, 2002; Shorter, 1997; Porter, 2002 and Warnock, 1978).

Mechanisms and / or structures are formalised in response to potential disruptions and other dangers to ensure educational provisions are provided in specific ways (Warnock Report, 1978); certain practitioners, therefore, are taxed with responsibility for determining cognitive abilities and / or inabilities of learners whose behaviours and academic performance appears subnormal in comparison to normal learners. These practitioners are also responsible for devising ways of managing LLDD' compliance to educational and / or behavioural norms (Gravetter and Wallner, 2007; Gross, 2005; Wolverson, 2003; Cohen and Manion, 2002; 2000; Stapleton, 2001; Karzdin, 2000; Smith and Iwata, 1997 and Davis, 1997. Much of this work is based on the notion of challenging behaviour as an abnormal cognitive response; yet, this notion of challenging behaviour as irrational or abnormal is being challenged. Some authors see a need to deconstruct the notion of a Personal Deficiency Model (Oliver, 1990) wherein challenging behaviour is seen as abnormal or disordered behaviour and reconstruct the notion of a Social Theory of Disability (Shakespeare and Watson, 2002 and 1997). This alternative conceptualisation of disability discourse influences how challenging behaviour is

conceptualised by some in the literature. Szasz (1972), for example, suggest mental illness is a myth; Brown (1973) questions the objectivity of rationale assessments and suggest persons deemed 'sick' might be healthy afterall; Goffman (1976 and 1963) expanding on his *Asylum* work, offers insights into how individuals might present themselves in prescribed and proscribed ways when interfacing with those deemed to be in positions of authority over them; Edgerton (1993) even suggest that behind the Cloak of Incompetence are very capable individuals who might mask their abilities because it is expected of them; Hunt (1996) elaborates on this when discussing the experience of disability; Davis (1997) went further with his discussion of how normalcy is a construction and highlights the invention of a so-called disabled body; Oliver (1990) did a similar thing when considering the politics of disability.

These writers and others, like Potter (1998; 1996a; 1996b; and Potter and Wetherell, 1993), discuss versions of discursive psychology; their emphasis is on how people construct their realities, develop elaborate repertoires, devise scripts and put on performances that, via Call and Response, serve to keep certain constructions intact. In short, these writers highlight the possibility that disabilities and, by extension, challenging behaviour are merely constructions; hence, they could be deconstructed. These writers also suggest different meaning could be assigned to taken-for-granted knowledge; thus, challenging behaviour could have different meaning to different people in a wide range of socio-economic and cultural context. As such, it might be useful to gain insights into how LLDD make sense of their challenging behaviour.

This short literature review on challenging behaviour attempts to tease out the way in which certain theories of disability impact practice. A further attempt is made to demonstrate that whilst there might be genuine concerns about safety and access to resources and wider community for people who suffer from disabling conditions, the issue of challenging behaviour is far more complex when it comes to actual solutions. Although challenging behaviour is characterised as abnormal and / or irrational behaviour, this section demonstrates that solutions involve restraint, special programmes and low arousal environments; yet, there does not appear to be the same level of research in understanding this behaviour from the perspective of LLDD who have been deemed to challenge learning and social environments. Early authors such as Goffman (1981; 1976; 1963 and 1961) illustrates the performance aspect to social life. Others suggested challenging behaviour might be LLDD way of simply conforming to professional expectations (Potter and Wetherell, 1993). In fact, Shakespeare (1996) and others suggest that irrespective of what seems like extensive professional narratives on disability and challenging behaviour, it might be time to listen to how LLDD make sense of such behaviours; he recognised the importance of developing a bottom-up approach to services and care.

METHOD

Sample. Given the participation of a vulnerable population of adults, special University Research Ethics Committee approval was sought and attained prior to the study. From two-hundred and sixty-five students (55% females and 45% males), fifteen male LLDD participated at my invitation in twelve weekly, 1 hour discussions in sense-making groups.

Three of the fifteen LLDD also participated in twelve weekly, 1 hour, semi-structured case study interviews specific to their challenging behaviors. LLDD were invited on the basis of the following: signed consent form; eighteen and older; absence of timetable conflicts and minimally one-year enrolment in a behavioral sports therapy program that utilized martial arts to help LLDD increase their confidence (a program routinely in place at the college). Selection of LLDD was informed by the Mental Capacity Act (2005) and the Disability Discrimination Act (1995 and 2005); both required measures to ensure LLDD understood informed consent and their right to decline participation without prejudice.

Confidentiality and anonymity of data were assured through appropriate procedures. Accepting that discussions involving power could create anxiety, LLDD were scheduled to meet with counselors to discuss concerns and also had access to management, duty officers and a consulting psychologist.

Consent Forms. Informed by the Protection of Vulnerable Adults Act (POVA), potential benefits and possible risks were explained to LLDD. A letter explaining the study was sent to parents encouraging them to discuss the study at home. LLDD were helped to understand their right to withdraw without risk or penalties. Their right to refuse to give information or to seek clarification about the purpose of the study or its methods was clearly emphasized.

Interview structure. Through the normal course of their studies, LLDD were familiar with challenging behavior as defined by practitioners; namely disruptions to learning and social environments.

Taking care to disguise case study names, instances of actual challenging behaviors, taken from curriculum database sources, were introduced. Initial questions, designed to ascertain LLDD accounts, followed pattern below:

Opening:	1.	Tell us what you think is going on in this situation.
Introductory/ Positional Stance(s)	2.	Can you explain the position of each person in the situation?
Transition:	3.	What do you see as the problem in this situation?
	4.	How could the student have handled this situation differently?
Key Questions:	5.	What could defensive stances in social interaction mean? How could non-defensiveness on the part of student have changed the situation?
	6.	How could defensive stances affect the interaction?
	7.	What could be done to reduce behaviors deemed to disrupt the educational process?
Key Questions:	8.	How could non-defensiveness on the part of student have changed the situation?
	9.	Do you see any of these defensive behaviors occurring in the situation? If so, please explain.
Ending		
Questions:	10.	What suggestion (s) would you offer to improve the situation?

Duty-officer and residential logbooks were also collected; copies were made of recorded instances of case study LLDD challenging behaviors.

Data Analysis Methods. Analysis of LLDD accounts was informed by Benner (1985) who emphasized that everyday human events are temporal, historical and grounded in language and cultural practices, and hence cannot be objectified or reduced to cause and effect explanations. I, therefore, entered into a dialogue with transcripts by focusing on LLDD accounts. My initial interpretation involved systematic analysis of the whole text, before breaking it down into manageable parts. I then considered the whole as well as component parts, looking for any discrepancies, common features or patterns in the way LLDD talked about challenging behaviour. Interplay between the whole and its parts revealed additional questions and possible themes that enabled me to formulate new questions that informed the next round of discussion. I also drew on my personal reflections, interviews, observations, fieldnotes and journal to assist in formulating themes.

VALIDITY OF THEMES

In any qualitative study, the issue is not simply whether another researcher will discover the same themes or derive at the same or similar findings; instead, the focus is on whether findings are worthwhile (Lincoln and Guba, 1985), on whether findings, within the context of this chapter, reflect LLDD accounts (Baker et al., 1992).

Qualitative research criteria is concerned with truth, value, applicability, consistency and neutrality (Lincoln and Guba, 1985; Sandelowski, 1986). Validity, therefore, relates to the hermeneutic nature of understanding; I, the researcher, could only present my interpretations of LLDD accounts. I did not accept the object-subject dictonomy; I question the notion of letting the facts speak for themselves or of knowledge independent of interpretation (Benner, 1994).

Having analysed transcripts, I formulated the following emergent themes:

- I've got a problem
- I told Staff
- I can't
- I'm not normal
- I'm disabled

As I explored themes, I found Austin's (1981) suggestion that it is more constructive to consider the ways LLDD [my emphasis applied] account for freedom and constraint helpful, particularly given the practitioner/LLDD binary could lend itself to them using a type of Defensive Disability Language (DDL) to justify why they cannot manage themselves in learning and social environments. Although Austin (1961 and 1962) provides ideas about the language of *excuses*, I expanded this idea to include emergent themes that highlight how LLDD use DDL purposefully to account for why they cannot manage themselves when, in fact, they are capable of doing so. In the sample transcripts to follow pseudonyms have been used to safeguard LLDD identities.

TRANSCRIPTS OF FOCUS GROUPS

Group 1: Intimate Violence

- Interviewer:* What do you think is going on in this situation?
- Trevor:* He's got a problem; it's upsetting to him when she can't tell somebody. She gets her boyfriend to clean her mess up.
- Interviewer:* What is his situation?
- Trevor:* She wants him to clean her mess up.
- Interviewer:* What is her mess?
- Trevor:* She not able to tell lads not to touch her; she wants her boyfriend to do it.
- Interviewer:* Why can't she tell somebody?
- Trevor:* She can't; maybe she afraid or something.
- Tim:* Yeah, she's got a problem and she's afraid to express her feelings. She needs to tell staff instead of getting her boyfriend to sort it out.
- Interviewer:* Why can't she clean up her mess?
- Trevor:* She afraid too or something; she's not able to because something is wrong with her.
- Interviewer:* What do you think is wrong with her?
- Trevor:* Maybe her disability; some students have disability and can't do some things.
- Interviewer:* Why does she need to tell staff?
- Tim:* 'Cause staff can fix it.
- Interviewer:* Can she fix it?
- Tim:* Maybe not; she got a disability; she might can't do it.
- Interviewer:* What does having a disability mean?
- Tim:* She's not like other kids; she's not normal, so she needs help with certain things.
- Tom:* I think the problem is he's sorting out his own girlfriend's problems.
- Interviewer:* Could this situation be handled differently?
- Trevor:* She can tell staff instead of telling her boyfriend.
- Tim:* I think she should talk to her tutor.
- Tom:* She needs to stand up for herself; stop letting him hit her.
- Tony:* She needs to stop giving other lads the special look.

Transcripts of Case Study: Intimate Violence

Extracts from first, second and third interviews with a young man personally struggling with this same issue are provided below, with the aim of ascertaining how this participant could envision managing his challenging behavior.

First Interview with David

- David:* I feel [deep sigh] it's not my place; I feel overprotective sometimes.
- Interviewer:* Can you explain what that means for you?

- David:* It means, it [Shuffling in chair], I feel it's my responsibility to sort out the problems that she's having.
- Interviewer:* Why do you feel it's your responsibility?
- David:* Because, um, I'm her partner or boyfriend and, um, I like to look after her. And sometimes it gets me down, having to sort someone else's problem.
- Interviewer:* Why do you feel you need to sort out her situations?
- David:* Because I think she; I have talked to her and told her to do it herself, but she doesn't do it and I spoke to [assigned counselor] at lunch time and she said, "I think all girls like you to feel jealous or something." But, and um, she told me I have to stay on to [girlfriend] about sorting her own problems out; which I do, sir.
- Interviewer:* Why do you feel it's your place to sort out her situations?
- David:* Because if I don't do it nothing will get done [pause]. The problem keeps going on and on and on.
- Interviewer:* What is the situation again?
- David:* The problem is she doesn't like people touching her. And she can't say it. She can't say it to them herself and, um, she wants me to tell them not her.
- Interviewer:* How does it make you feel, her asking that you take on that responsibility?
- David:* It makes me feel good 'cause it makes me feel as though she's trusting me with information.

Second Interview with CS¹

- Interviewer:* What does it mean, 'being over protective'?
- David:* Taking control of, for instance, because [...], my girlfriend, I like to protect my girlfriend (pause); which I have been controlling, sir.
- Interviewer:* How does controlling her make you feel?
- David:* It makes me feel as though she needs me, sir; like I'm wanted.
- Interviewer:* What does her flirting look like?
- David:* She gives them a special look that she only gives to me; I can tell that she's flirting.
- Interviewer:* Is it possible that you misunderstand the look?
- David:* It is a possibility, yes, but it could be that she's given them the look; that's what's in my mind.
- Interviewer:* Do you have a special look when you see a woman you like?
- David:* Yes, I have [smirk] a certain look when I find other people attractive apart from my partner, but I'm faithful, and that means I'm not going out with anyone, um, but [...].
- Interviewer:* Do you find other people attractive?
- David:* Yes, it's human nature.
- Interviewer:* When you see her giving this special look how do you respond?
- David:* I snap and lose control.
- Interviewer:* What does "snap" look like?
- David:* You know, get mad, get angry, usually go outside and bang doors.
- Interviewer:* Is it possible to give the look a different meaning?

- David: Yeah [silence].
 Interviewer: In your mind, do you compare yourself to these guys she gives the look too.
 David: [surprised look] Yeah!
 Interviewer: Is it possible to change this pattern of comparing yourself to these guys?
 David: Yes, but I've got to make, um, I've got to feel good about myself.

Third Interview with CS¹

- David: At my previous school, my partners always cheated on me.
 Interviewer: Are you afraid the same thing will happen with your current girlfriend?
 David: Yes.
 Interviewer: Is it possible your current girlfriend won't cheat on you?
 David: Yes, she hasn't done so yet.
 Interviewer: Could your intimate violence be related to what happened in past relationships?
 David: Yes, I can see that this is happening.
 Interviewer: Is it possible to think differently about your current relationship?
 David: Yes, I would have to learn to trust [...].

IDENTIFYING DOMINANT NARRATIVES

David's willingness to reflect on his intimate violence was initially hampered by various defensive responses that entailed positioning to *avoid*; for example by suggesting his current partner had an issue with males touching her when, in fact, it made him uncomfortable. Consequently, he instructed her to disclose when this occurred. Over the course of interviews, he was able to recognize this as his power and control strategy (Jacobson and Gottman, 1998). He was, initially, unclear about how latent issues stemming from physical and emotional abuse experienced as a child and subsequent placement in foster care contributed to problem saturated relationship narratives; yet, having explored his use of power to solicit specific responses from his partner, he demonstrated a capacity to understand his basic conflict (Horney, 1972). Phrases like 'overprotective', 'my responsibility to sort out her problems' and because 'I'm her boyfriend' highlight linguistic patterns of power and control used by perpetrators (Murphy, C. and Eckhardt, C., 2005); yet with prompting David demonstrated he had a sense of his internal processing. He reflected on communication and behavior patterns in his relationship, explained meanings he assigned to his lived experiences and positioned himself accordingly having clung to patriarchal assumptions around gender roles. David appreciated that his partner's behavior was fear-based; a reaction to his intimate violence; this reflects a change in his self-awareness. He elaborated on my comments, rather than simply agreeing. Instead of focusing on his girlfriend, he accepted his intimate violence was predicated on being wounded in previous relationships (Horney, 1972).

**KEY FINDINGS FROM GROUP
DISCUSSIONS AND CASE STUDY INTERVIEWS**

LLDD view challenging behavior in ways that differ from practitioners. The latter view them as disruptions to learning and social environments; the former view certain behaviors, when operating on a conscious level excluding critical reflection, as resistance to traditional practices, wherein LLDD play the “Disability Game,” purposefully using Defensive Disability Language (DDL), Defensive Positional Stances (DPS) and Power Plays (PPs) to assert power over Practitioners (see Figure 1: Appendix 1).

Lee, 2011.

Figure 1. Students' variable processing.

VARIABLE PROCESSES OF LEARNING DISABILITY CULTURE

Responsible or irresponsible defensive communicative and behavioral patterns, when occurring consciously, but outside of critical awareness, represent one of several responses to traditional practice: Inner Conflicted, Conditioned, Role Specific, Retreating or Higher Order. Each of these variable processes is described in detail below.

Inner Conflicted and Conditioned Responses

At an unconscious level, some LLDD appear *Inner-Conflicted*; yet, they are unable to articulate their experience. They sense being normalized, disciplined and managed.

In response, a type of psychological splitting results and LLDD escape into a solitary inner-place to protect their identity. They also display *Conditioned Response* behaviors, acting in ways indicative of their label to solicit predictable responses in learning and social environments. When such responses operate outside of critical awareness, some LLDD display a version of acting responsibly by turning problems over to practitioners.

Yet, other LLDD, when acting consciously, deliberately disrupt routines of practitioners by refusing to cooperate with their interventions.

Still, they cannot, initially, articulate why they resist; nonetheless, their inner conflict and conditioned responses begin to follow predictable patterns.

Role Specific Responses

Other LLDD discover, as a result of repeated discursive engagements, that they can act without consequences in learning and social environments; they realize practitioners use elaborate and exculpatory explanations to account for their behavior.

They understand others engage with them on the basis of assigned labels and not their actual abilities; consequently, some LLDD discern their label gives them a type of power or permission to be deviant.

Retreating and Higher Order Responses

Retreating and *Higher Order* responses involve LLDD who have an awareness of defensive ways of experiencing.

Instead of conducting themselves accordingly, they interact in learning and social environments using newly formulated understandings of their identity; they draw on narratives that exceed assigned characteristics. Yet, when bombarded with Binary Branding Normalcy Normality (BBANN), Putative Social Identity (PSI) and Multidimensional Social Networks (MSN) influences, some LLDD become overwhelmed and *Retreat* to familiar territory, sacrificing the more self-regulatory possibilities they begin to envision and situate themselves once again in a dominant narrative of disability.

Alternatively, other LLDD, those differentiated enough to persevere, attain *Higher Order* challenging behavior; they have a sustained identity that is formulated via actual lived experiencing.

These LLDD are more able to identify their own role in processing problematic situations and responding sub-optimally, ultimately recognizing the possibility of greater choice and self-control in the future.

DEFENSIVE DISABILITY LANGUAGE, DEFENSIVE POSITIONAL STANCES AND POWER PLAYS

Denied self-management opportunities, LLDD engage in DDL having drawn from dominant narratives to inform their sense of being in learning and social environments.

Those operating variably internalize the belief they cannot manage themselves and position themselves accordingly; calling on practitioners to perform assigned roles. They follow prescribed and proscribed learning disability narratives (see Figure 1: Appendix 1) and, by way of inception learn to speak in specific ways, not realizing each statement has built-in assumptions about how LLDD view themselves.

Other LLDD, operating within variable processes, having attained a heightened level of awareness use Power Plays to achieve desired outcomes in learning and social environments.

LIMITATIONS OF STUDY

The overall results of this study reveal LLDD could engage in critical conversations specific to challenging behaviour and managing themselves responsibly; they could make sense of their lived experiences and, within variable processes, they do act responsibly when handing their problems over to practitioners and / or irresponsibly when using their learning disability label to achieve desired outcomes in learning and social environments. Results reveal LLDD view challenging behaviours in ways that differ from the sense practitioners make of it. The latter view these behaviours, in variable ways, as disruptions to learning and social environments; the former, however, view such behaviours as either acting responsibly and / or as resistance to traditional psycho-educational provisions that aim to normalise, discipline and / or manage their compliance to the status quo. Clearly these conflicting understandings might lend themselves to oppositional positioning; consequently, both might benefit from a shared understanding of challenging behaviour and a complementary methodological outlook when addressing this issue. Results further reveal LLDD, in response to a perceived power imbalance, play what is referred to in this chapter as the Disability Game; via variable processing they purposefully use DDL, DPS and PPs to assert their power over learning and social environments to achieve desired outcomes. This is relevant because an alternative provision could possibly assist LLDD and practitioners in understanding conditions that constitute variable communicative and behavioural responses that might be counterproductive to learning and social environments; behaviours that serve, whether intentional or not, to maintain the status quo.

Whilst generalizability of results is not the intended aim, findings might prove useful if practitioners account for the sense LLDD make of challenging behaviour and managing themselves; clearly, given the results of this study, any efforts on the part of practitioners to manage LLDD compliance might result in failure; alternatively, a provision grounded in the sense LLDD make of their behaviour might prove useful.

My role at college X made it impossible to be disengaged; therefore, it was necessary to highlight my hidden assumptions, values and beliefs before discussing how I mitigated against them during analysis.

Although LLDD came from different socio-economic backgrounds, findings in this study seem pertinent only to LLDD with similar characteristics (i.e., attend specialist college; median age of 19 and present with learning difficulties and physical disabilities).

Additionally, methods used to collect data over a twelve weeks period made it possible for LLDD to elaborate on their sense of challenging behavior; yet, in research terms, this is a short period of time. Moreover, there was no planned follow-up to determine if LLDD operated non-defensively following college; several researchers find non-defensive behaviors [my emphasis applied] decrease over time (Gulanick et al., 1998). Further to this, whilst LLDD provided invaluable insights; whilst their narratives contributed to an understanding of their variable processing, female accounts were altogether missing. Lastly, LLDD accounts enhanced credibility of this study but fifteen out of two-hundred and fifty LLDD indicates a need for a broader-based study that includes female LLDD.

RECOMMENDATIONS FOR FURTHER RESEARCH

In light of a shrinking economy, and given shortcomings of traditional practice, a longer, broad-based, in-depth qualitative study could expand our understanding of how LLDD make sense of challenging behavior; yet, a harsh reality remains, a new way forward is implausible unless practitioners face what is really challenging about challenging behaviors.

RECOMMENDATION FOR A NON-TRADITIONAL PSYCHO-EDUCATIONAL PROVISION

The principle aim of psycho-educational support could be to help LLDD increase levels of differentiation from their enmeshment, whether consciously or unconsciously, in BBANN, PSI and MSN influences.

By way of critical conversations that are framed in experiential / dialectical-constructivist understandings, a psycho-educational provision needs to be action-oriented; meaning, deliberately drawing on LLDD accounts to call into question taken-for-granted learning disability knowledge and traditional practice. Whilst engaging experientially / dialectically with LLDD around power relationships; normalising, disciplining and management influences and forces of hegemony and injustice, critical conversations during lessons, behavioural groups and 1-to-1 counselling (all curriculum-based) could be grounded in deconstructing commonly held learning disability norms, values and assumptions.

Working toward a shared aim of recovery from BBANN, PSI and MSN influences, curriculum-based psycho-educational work of psychologists / counsellors could be directed toward increasing LLDD awareness of being in the world independent of prescribed and proscribed narratives.

CONCLUSION

After assuming a post at the college, I was directed to manage the challenging behaviours of LLDD; yet, I envisioned my role as assisting them in acquiring skills to manage themselves. Given conflicting methodological outlooks, I sought to determine to what extent LLDD could organise, interpret and re-organise sense-making processes; could consider novel ways of conceptualising challenging behaviours and could use enactments to broaden non-defensive responses in learning and social environments.

I conducted an in-depth review of policy and the concept of learning disability to determine how challenging behaviour came to be defined. I examined literature with attention to the 1845 Lunacy Act; the Mental Capacity Act (1914); the 1944 Education Act and the Warnock Report (1978). I examined quantitative and qualitative approaches respectively; this resulted in a qualitative study that explored the everyday world of LLDD at the college using group discussions and case study interviews. The overall conclusion is that managing LLDD limits their potentiality and results in the emergence of their variable processing; LLDD acting responsibly or irresponsibly to assert power in learning and social environments. Alternatively, discourses grounded in LLDD managing themselves could be useful, suggesting several concrete professional practices that could enhance this goal.

Chapter 54

INSPECTION TIME FOR VERBAL STIMULI: LETTER DETECTION, IDENTIFICATION, AND DISCRIMINATION SPEED

Tabitha W. Payne*, PhD and Gaither Smith

Kenyon College, Gambier, OH, US

ABSTRACT

Mental speed is defined as the speed at which neural processes are completed and it has been found that individual performance on speed measures significantly correlates with fluid intelligence scores. Given that traditional measures of mental speed use a discrimination judgment, the goal of this research was to expand upon the design of inspection time tasks, in which the exposure time for sensory stimuli is manipulated. In this study, mental speed was assessed using several novel inspection time measures that involved speeded letter detection and identification, along with letter-pair comparisons. The letter detection time task was considered to be the most basic measure of time needed to accurately perceive the presence of the stimulus, whereas letter identification requires the addition of verbal processes to label the stimulus. For each measure the time for the presentation duration of the target stimuli was varied from 80 to 16 milliseconds. In addition to the 3 inspection time tests, both fluid intelligence and working memory capacity were assessed. Fluid intelligence was assessed using a standardized visual reasoning test (Ravens), while working memory capacity was observed using a computerized complex span measure (Counting Span). Performance data for the inspection time tasks indicate that detection task was significantly easier, even under extreme time constraints for stimulus processing (16ms) in comparison to the letter identification and discrimination versions, in which accuracy dropped more drastically with decreasing inspection time. Correlational data revealed that all 3 speed measures predicted intelligence, however, only identification was related to working memory. Both mental speed and working memory capacity are significantly correlated with fluid intelligence, but each process makes a unique contribution to intelligence.

* Corresponding Author Email: paynet@kenyon.edu (tel: 740-427-5249).

The concept of mental speed was originated by Sir Frances Galton over a century ago, as an individual differences construct that contributes to variance in higher-order intellectual activities, such as reading comprehension or mental rotation. Galton considered this theoretical cognitive process of mental speed to be the result of the rate of neural firing in the brain, which may vary from one individual to the next. Those who need only a brief period of exposure time with a stimulus in order to make accurate decisions about it might perform better on a wide range of more complex intelligence assessments than those with slower neural firing. Galton's theory on mental speed and its relationship are presented in the first text book on psychology, *The Principles of Psychology* by William James (1890). In this chapter Galton claimed that fast neural firing would allow for better sensory discrimination, which could subsequently influence more complex decisions and judgments in other cognitive activities related to problem solving and reasoning. To expand upon this notion of mental speed, individuals who are fast information processors may be aware of briefly presented stimuli and perhaps better able to represent them in memory for later analysis in the context of reasoning. This theoretical process of mental speed has inspired further research of Spearman's (1904) theory of general intelligence (G), with fluid intelligence (G_F), or the ability one has to use primitive brain processing being comprised of mental speed, along with controlled attention/working memory as key components (Marshalek, Lohman, & Snow, 1983; Ackerman, Beier, & Boyle, 2002).

Currently, in the early 21st century, there are no direct measures or observations of this concept of mental speed. To date, neuroimaging techniques such as fMRI, PET, and ERP are not sensitive to such fast reactions of neural firing in the brain, and thus psychological science has resorted to clever designs with indirect cognitive assessments of mental speed. Some of the more widely used assessments are pen and paper format measures that involve letter, pattern, or number discrimination decisions that are performed under strict time constraints. Figure 1 provides some examples of speeded letter discrimination tasks (Salthouse & Babcock, 1991; Sheppard & Vernon, 2007). Tests such as these have 25 items on a page and require participants to decide if a given row consists of same or different letter strings, and the number of letters included in the strings varies from one example to the next. Responses are made by the participant writing in "S" for same and "D" for different on the line between the letter strings on a given row. Typically, there is a 1 minute time limit for the pen and paper versions. Newer computerized versions with a similar format are also currently in use (Reddick, Unsworth, Kelly, & Engle, 2012), in which letter string pairs are presented on a computer screen and reaction time can be measured for each item set. With this format, participants would see one pair of letter strings at a time and both accuracy and decision time can be observed.

Mental speed measures can be divided into several more specific categories of cognitive assessments of *reaction time* measures and *then inspection time* measures (Sheppard & Vernon, 2007). Each paradigm is emphasizing speed of processing information, however, reaction time tasks use a wide array of stimuli and decisions and include both simple and choice reaction time measures. These measures of reaction time may be considered to be observations of decision times for domain-specific stimuli, for example, tests like the Shepard and Metzler (1971) for mental imagery in which one must decide if two patterns are the same or different (however, when the same, the stimuli may be rotated at varying angles with more rotation leading to increase in reaction time). Such examples, along with the letter discrimination speed measure (Figure 1), require a series of cognitive processes leading to a

response regarding same/different. For both types of measures, participants must visually scan two areas of space, perhaps repeatedly scanning information and comparing, before making a decision. Such a comparison process requires the formation of an adequate representation of each in order to make an accurate decision. For both letter string discrimination and mental rotation, the dependent measure is the time between the presentation of the stimuli and the time at which the participant responds, usually by pressing a key to indicate a response.

Figure 1. Example of standardized mental speed assessment in which participants must decide if letter strings of varying length are same or different with a strict time constraint. Quick information processors may complete these more rapidly and with less error.

Aside from general reaction time paradigms, mental processing speed is also assessed by the inspection time (IT) task paradigm, which involves varying the amount of exposure time to stimuli. Traditionally with these assessments, participants also make decisions about whether two stimuli are the same or not. This discrimination format between the reaction time and inspection time measures is commonly used and may be a direct tribute to Galton's *senses-intelligence hypothesis*, in which sensory discrimination is a process in which the timing is subject to individual differences which may contribute to intelligence. A recent extensive review of intelligence research from last 50 years, confirmed the significant correlations that exist between intelligence and traditional inspection time measures (Sheppard & Vernon, 2007). Findings generally reveal that inspection time performance correlates more strongly with fluid intelligence (i.e., mental skill) than crystallized intelligence (i.e., acquired cultural knowledge and domain-specific expertise) and that overall correlation is moderate, but very consistent across many different studies (Sheppard & Vernon, 2007).

The discrimination format of inspection time measures can also vary in design, with either a simultaneous stimulus display (for visual stimuli) or a successive stimulus display, as in the auditory inspection time task (Bates, 2005; Deary, 1994; 1995; Deary, Caryl, Egan, & Wight, 1989). In either case, a backward mask is used to limit the sensory persistence for stimuli. Thus, unlike general reaction time measures, inspection time tasks manipulate the amount of time one is exposed to information, or the duration allowed for "inspection". A

backward mask is a more complex stimulus that immediately follows a target stimulus to disrupt further sensation and perception. For visual stimuli, the mask must occur immediately and endure for 200-350 ms after the target to disrupt processing. Aside from the masking stimulus to control when processing stops, the amount of time the participant is provided with to observe is also limited and manipulated for comparison purposes (i.e., to observe the discrimination judgment with exposure times of 100 versus 50 milliseconds). The resulting observation is a measure of accuracy of processing, given the specified exposure duration.

To expand upon the current research on mental speed using inspection time tasks, the goal of this research is to compare test performance with a wider range of decisions – other than discrimination, such as detection and identification. Discrimination judgments used in traditional measures require comparison processes, which may rely on other primitive cognitive systems for attention and working memory. Therefore, the traditional tasks using discrimination decision may not be the most pure measures of inspection time/mental speed. In order to better understand mental speed measures, it would be useful to compare performance on measures with other decisions. Detection requires conscious perception of a visual stimulus, in this study, a letter. Presenting a letter with forward and backward masking stimuli for brief periods would provide a measure of how much time is necessary for an individual to merely see a verbal stimulus. This measure of processing time required for conscious letter detection would be akin to assessing the threshold for which a visual stimulus goes from liminal to subliminal, which could vary in individuals. Additionally, identification of that letter takes further cognitive processing by accessing areas related to the verbal labels for the stimulus, as well as the process of conscious detection. Inspection time for letter discrimination, with a simultaneous presentation of letter pairs will be compared with both detection and identification versions of the test.

Hypotheses regarding performance differences would be based on overall accuracy for the 3 different measures, however, it is also important to manipulate the exposure time for each for further comparison. Exposure (or stimulus duration) times in this study are minimal and range from 80 ms to 16 ms, which is the shortest duration one can present given current computer display refresh rates. This study uses a typical psychophysical design with descending staircase method with respect to the exposure times, with trials presented in blocks in which the stimulus duration decreases with each block. Since letter detection is the most basic decision, and may not rely on verbal processing, but perhaps general pattern perception, this task should yield higher accuracy with small exposure durations in comparison to more complex tasks, such as letter identification and discrimination. Since the later require additional processing, it is likely that more time would be needed for accurate decision making.

In addition to comparing the 3 inspection time measures, potential correlations with a standardized measure of fluid intelligence will also be observed. Since there is already evidence that inspection time with a discrimination judgment correlates with G_F , the letter discrimination inspection time task should correlate with intelligence, using the Raven Advanced Progressive Matrices test of figural reasoning (Raven, Raven, & Court, 1998). Although the letter detection and identification versions for inspection time are novel, if both are valid measures of neural firing speed, then according to theory, they should both correlate with IQ as well.

Another observation in this experiment is the potential correlation between the speed measures and working memory, which does not always correlated with speed measures

employing a discrimination design (Reddick, Unsworth, Kelly, & Engle, 2012). However, both have been found to correlate with intelligence (Ravens task), and thus it is possible to find evidence for either independent or interactive influences of working memory capacity and mental speed on fluid intelligence. Working memory capacity in this study was observed by a commonly used computerized complex span measure, the Counting Span task (Payne, Kalibatseva, & Jungers, 2009; Conway et al., 2005; Kane et al., 2004; Engle, 2002), which requires participants to engage in a difficult visual search while trying to remember a series of numbers.

This research combines experimental and correlational methods to better understand inspection time design and the relationship between mental speed, intelligence, and working memory. The importance of this study is the comparative understanding of decision processes in the design of basic cognitive tasks assessing mental speed. The results wield the potential to expand our understanding of what mental speed is, and at what point it relates to intellectual processes based on the additive cognitive functions required for each speed measure used. Currently the traditional discrimination versions have been found to correlate with fluid intelligence, and thus the novelty of this study is to examine potential relationship with inspection time for detection and identification with IQ. An additional benefit of exploring the various inspection time tasks is that the use of verbal stimuli makes these assessments potentially useful in related research on language processing and difficulties, and could be used in the understanding of written language abilities and learning to read.

METHOD

Participants

One hundred central Ohio community members volunteered to participate in this study (those who were between 18 to 45 years were eligible). Participants were recruited through informational flyers posted at Kenyon College, as well as an advertisement in the local newspaper. Volunteers either received credit for research participation in a psychology course if currently enrolled, or received monetary compensation. All participants had normal or corrected to normal vision and were native English speakers.

Materials

Visual Acuity Screening

After informed consent and volunteering basic demographic information, such as age and sex, each participant performed a visual acuity test using a standardized Snellen Eye chart to screen out any individuals with potential vision difficulties. This basic procedure requires individuals to read letters of varying sizes (line by line). Participants were informed to wear corrective eyewear for this assessment. All participants passed the visual acuity test screening with 20/20 vision.

Inspection Time for Letter Detection and Identification

This computerized performance measure required participants to identify letters appearing on the computer screen for increasingly shorter periods of time. There were 5 blocks of fifteen trials, each with the target letter appearing for shorter and shorter periods of time. The target letters were X, Z, H, K, and E, presented in size 18. The first block was an easy practice block where the target letter appeared for 500 msec. In the following blocks, the target letters were presented for 80, 50, 30, 20, and 16 msec. Five trials were “blank” trials in which the target letter did not appear. The other 10 contained a target letter. Each target letter was presented twice in a block.

Participants viewed a “Ready” screen that prepared them for the coming trial. They pressed the spacebar to initiate a trial. In each trial, there was first a pause of 500ms. Then a “#” sign was presented in size 18 font for 30 ms. Next the target letter did or did not appear. The target letter (or blank) was then be followed immediately by another “#” sign for 300ms. For each block, the participant viewed a random order of blank and target trials. Participants were then asked to indicate whether they saw a target letter or not by pressing either “1” for yes or “3” for no. They were next asked to indicate which letter they saw, if any, by pressing the respective key on the keyboard, or “3” again for no letter. The participants were then given feedback on whether they had picked the correct letter. This task was scored on two levels: accuracy for detection and identification, for each presentation duration block.

Figure 2. The series of rectangles represent the sequence of events occurring with the mental speed assessment for letter detection and identification. The participant first sees a “Ready” screen, and can initiate a trial at any point, allowing for self-pacing. Once the trial is initiated there is a 500 ms foreperiod followed by a 30 ms “#”, then the target stimulus (if a “present” trial), which remains for either 80, 50, 30, 20, or 16 ms. Next the backward mask appears for 300 ms. Afterward, an instruction screen asks, “Did you see a letter”, and the participant can respond by pressing designated keys for “yes” and “no”. If a letter was reportedly detected, the participant is asked to identify that letter by typing it on the computer keyboard.

Inspection Time for Letter Discrimination

This computerized task required participants to determine whether two letters presented as pairs on the computer screen for increasingly shorter periods of time were the same or different. There were blocks of fifteen trials, each with the target letter pairs appearing for shorter and shorter periods of time. The target letter pairs were XX, KX, EH, ZZ, or XK presented in size 18 font. The first block was an easy practice block where the target letter

pair appeared for 500 msec. In the following blocks, the target letter pairs were presented for 80, 50, 30, 20, and 16 msec. Each target letter pair was presented twice in a block.

Participants viewed a “Ready” screen that prepared them for the coming trial. They pressed the spacebar to continue on to the trial. In each trial, there was first a pause of 500ms. Then a “#” sign was presented in size 36 font for 30 ms. Next the target letter pair did or did not appear. The target letter pair was then followed by another “#” sign for 300ms. Participants were then asked to indicate whether the two letters in the target pair were the same or different by pressing either “1” for same or “3” for different. The participants were then given feedback on whether they had picked the correct response. This task was scored based on accuracy of discrimination for each presentation duration block. A series of task events in the experimental timeline are shown in Figure 2 for the letter detection and identification versions of the inspection time task. The discrimination version includes the same trial events, only with letter pairs (side by side, with no space between).

Counting Span Working Memory Task

This working memory capacity assessment involves controlled visual search while alternately updating a list of quantities counted to be remembered later. The version used for the current study has been used in previous research and was shown to have good reliability, with Chronbach’s $\alpha = .71$ to $.77$ (Payne, Kalibatseva, & Jungers, 2009; Kane et al., 2004). This measure was administered on a computer using E-prime 1.0 software. Participants were instructed to count the dark blue circles presented on a series of screen displays. Dark blue circles were surrounded by distractor items that shared colored and shape characteristics (dark blue squares, light blue circles). Once the participants counted the total number of targets on a screen aloud, they were instructed to repeat the final number, upon which the experimenter prompted the next screen of stimuli or a signal to recall the number of targets for that set of displays. The participants were unaware of how many item totals would have to be remembered during any given memory set trial. Memory sets contained 2 to 6 items, with 3 sets of each giving a total of 15 memory sets and 60 points possible. The measure was scored conservatively by adding up only the total number of sets for each participant with correctly completed recall that maintained the order of the items as they were presented on the computer display (Conway et al., 2005).

Raven’s Progressive Matrices Intelligence Assessment

For this pen and paper assessment, participants were presented with a pattern of eight black-and-white figures arranged in a 3 X 3 matrix with one cell missing. Figures ranged from simple geometrical shapes to complex textured patterns. Participants were required to select a figure out of eight options presented below the matrix that would best complete the overall pattern of the matrix, such that the rules of change apply accurately in both multiple directions of the figure matrix (vertical and horizontal). Following 2 practice items, participants were limited to 10 min to complete 18 test matrices that increased in difficulty, consistent with previous research (Kane et al., 2004). The items used in this shortened version consisted of the odd-numbered patterns from the RAPM Set II, and have been found to be internally consistent (Kane et al., 2004).

Figure 3. In the Counting Span Task, participants are asked to count the number of blue circles aloud and then remember that number after counting a number of screens (2 to 6). Examples of the stimuli are included here. Note that there are two types of distractors that share a conjunction of features (such as color or shape), to promote a controlled visual search process that requires focus, while trying to update and remember a list of targets counted.

Procedure

Participants were tested individually at the Kenyon College Cognition Lab. Upon completion of the demographic questionnaire and the visual acuity screening, each participant performed the computerized inspection time tasks in the context of a sound attenuated laboratory area. In order to promote equality in visual angle across individuals in the sample, for all 3 speed measures, participants sat in a stationary chair with the head 17 inches from the computer monitor and were instructed prior to task not to lean forward. After practice trials with the experimenter present, individuals were able to self-pace through the inspection time tasks on their own and could work independently without distraction. After completing the inspection time tasks, an experimenter administered the Counting Span Task, recording remembered items on a response sheet. For the Raven's task, participants worked on their own and recorded responses on paper. The entire experiment lasted between 45 min and 1 hour for individuals in this sample set. Each participant was compensated (with cash or credit for a course) immediately following the study. All participants were informed that they had the right to skip items on the demographic questionnaire and had the right to stop or skip any parts of the procedure however, all participants completed the study.

RESULTS

Descriptives

Participant Descriptives

Out of 100 community participants, 46% of the sample was comprised of males and 54% females. The majority of the sample were young adults with the mean age was 20.82 years old, with a standard deviation of 4.74. All participants were either working on obtaining a college bachelor's degree or had already achieved that accomplishment.

Performance Descriptives

Descriptive data for all measures used are listed in Table 1, which includes the 3 inspection time tasks, the counting span measure of working memory, and the Raven's test for intelligence. With all 3 inspection time assessments being on the same scale of accuracy

(using percentage correct), it is clear to see that the letter detection task is easier to perform and has a more limited range of scores in comparison to letter identification and discrimination.

Table 1. Descriptives for Performance Measures

Measures	M	SD	Range
1. Speeded Detection	.94	.07	.71-1
2. Speeded Identification	.72	.11	.51-.96
3. Speeded Discrimination	.74	.13	.52-1
4. Counting Span Task	30.24	13.42	6-60
5. Raven's Matrices	11.02	2.58	3-17

Inspection Time Tasks

Since the speeded letter detection version is the most basic in terms of theoretical processes involved, this task should have higher accuracy than the other more complex versions. Mean percentage accuracy on each inspection time task is shown in Figure 4, as a function of stimulus duration time (from 80 to 16 ms) with standard error bars. Using a 3x5 within-subjects factorial design (for task type by stimulus duration, results of a General Linear Model ANOVA revealed a significant main effect of task type, ($F(2,98) = 219.26, p < .001$) with detection yielding significantly higher accuracy overall.

Figure 4. This graph shows the mean accuracy for all three versions of the letter inspection time tasks. Note the drastic difference between detection and the other tasks. Standard error bars are included to note differences between conditions.

Post hoc analysis data indicated no difference between overall accuracy on identification and discrimination ($p < .05$). As expected, there was a significant main effect of stimulus duration, with accuracy overall dropping with reduced presentation time ($F(8,92) = 14.37, p <$

.001). There was also a significant interaction between test type and stimulus duration on accuracy, ($F(4,96) = 34.00, p < .001$). For the letter detection task, there was only a significant drop in performance when the stimulus duration was reduced to 16 ms, as pairwise comparisons revealed a difference between accuracy at 20 and 16 ms durations, ($t(99) = 2.83, p = .006$). The letter identification and discrimination tasks showed very similar data patterns across durations, however they differed from one another at both the 20 ms condition ($t(99) = -2.82, p = .006$), and the 16 ms condition ($t(99) = -3.46, p = .001$), with the identification task having the lowest accuracy in both. There were also differences in the 50 ms conditions ($t(99) = -2.00, p < .05$), but identification is actually easier at this exposure duration. Lastly, there were no significant correlations with age and inspection time or sex differences ($p > .05$).

Table 2. Correlations among specific inspection time tasks, working memory capacity, and fluid intelligence

Measures	1	2	3	4	5
1. Speeded Detection	—				
2. Speeded Identification	.62**	—			
3. Speeded Discrimination	.31**	.44**	—		
4. Counting Span Task	.13	.17*	-.01	—	
5. Raven's Matrices	.29**	.41**	.25**	.36**	—

**Significant at .01, *Significant at .05.

Inspection Time, Working Memory, and Intelligence

The correlations between performance measures are provided in Table 2, (based on one-tailed tests). All of the inspection time assessments correlate with one another, as well as the Raven's test of intelligence. This relationship between letter inspection time and Raven's is stronger for the letter identification task ($r = .41$) in comparison to the other two speed measures. The counting span also correlates with the Raven test. Additionally, the counting span working memory task is correlated only with the letter identification version of inspection time, although the relationship is still fairly weak ($r = .17$). It is also important to note that overall speed, computed as an average score for the 3 inspection time measures, did not correlate with working memory ($r = .11, p = .30$). Overall speed did correlate significantly with the Raven's test ($r = .39$), indicating independent influences of speed and working memory on fluid intelligence (as shown in Figure 5). Multiple regression revealed that 26% of the variance in the intelligence measure was explained by speed and working memory ($R = .51, p < .001$), with both speed ($\beta = .32, t = 3.64, p < .001$) and working memory contributing significantly ($\beta = .36, t = 4.05, p < .001$).

Inspection Time Stimulus Durations and Intelligence

In order to observe when the relationship between speed of processing and intelligence occur, the correlations between mean percentage accuracy on each speed measure, specifically by the average for each set of stimulus presentation durations and the raven's performance were calculated. Correlations are listed in Table 3. For letter *detection*, performance accuracy correlates with Ravens significantly for all durations except the easiest 80 ms duration, which may indicate the ease of that condition in the task. For letter

identification, accuracy correlates with intelligence at all presentation durations. However, for the discrimination task, there is no correlation at 80 or 30 ms. The lack of relationship at 80 ms could plausibly be due to ceiling effects, however, the lack of correlation with 30 ms is more difficult to explain.

Figure 5. Both overall mental speed and working memory capacity have independent influences on performance on the fluid intelligence measure. First-order correlations are listed.

Table 3. Correlations between specific stimulus exposure conditions on the inspection time tasks with intelligence

Stimulus Exposure Duration	Detection	Identification	Discrimination
80 ms	.11	.26**	.13
50 ms	.22*	.33*	.24**
30 ms	.32**	.27**	.15
20 ms	.23*	.29**	.23**
16 ms	.24*	.32**	.19*

**Significant at .01, *Significant at .05.

DISCUSSION

The primary goal of the research was to expand understanding of the concept and thus the measurement of mental speed, by addition of letter detection and identification versions of inspection time assessments that have traditionally been designed around a discrimination paradigm. Since discrimination judgments rely on scanning and comparison processes, the creation of a more basic task, the letter detection version, may be the most primitive decision for inspection time possible using psychometric methods. By manipulating the amount of stimulus exposure time, direct comparisons can be made across tasks and between conditions so that it is possible to observe when difficulty and inaccuracies occur, and even which conditions may be predictive of intelligence.

With the comparison of accuracy across the three inspection time tasks, it is clear that letter detection is fairly easy and only drops at 16 ms, (although the drop is still a small percentage). Letter identification and discrimination are very similar, with the exception that they become statistically distinct with stimulus durations exposures of 20 and 16 ms. Letter identification becomes increasingly more difficult with brief exposures, whereas letter discrimination remains fairly steady with exposures of 30 ms and shorter.

These data document variation in young adult mental speed for 3 basic decisions with simple verbal stimuli, letters. For detection, the target information must be presented long enough for conscious visual perception. However, for the identification task, verbal processing must occur in order to label the stimulus, and potentially access to representations in memory. This additional language processing for identification, as well as theoretically, extra scanning for discrimination decisions about letters that are adjacent to one another requires more inspection time for an accurate decision in comparison to mere detection.

An application of these findings would apply in subliminal processing, and in marketing. If a stimulus is presented very briefly, with a more intense or complex visual mask (or another image) following rapidly to disrupt iconic persistence of the image, viewers will likely see it, since accuracy on detection (at least with one letter) was very high (above 90%). However, you will be less likely to be able to identify it or discriminate letters if the exposure time is 30-20 ms in duration.

The rate of neural firing or mental speed varies between individuals, and as this study indicates, that rate of firing is indicative of higher-order intellectual reasoning, as measured by the visual matrix test. This neural speed could possibly be the time needed for the brain to make an accurate, precise representation of stimuli. The precision needed may be dependent on the type of decision the information will be used for (identification or discrimination). The more complex the subsequent decision or processing is, perhaps the more detail may be needed. Without adequate time for an accurate representation of stimuli, more complex reasoning would subsequently be at detriment.

The letter inspection time tasks all show good convergent validity, as they inter-correlate significantly. They also have good predictive validity with all measures correlating with intelligence, as measured by figural reasoning (which is consistent with previous research; refer to Sheppard & Vernon (2007) for full review). Such findings provide support for a theory of general intelligence in which some basic processes, such as those used in the working memory system and mental speed are primitives of fluid intelligence and reasoning. Although overall speed did not correlate with working memory (consistent with Reddick et al., 2012), performance accuracy on the letter identification task did, although it was a weak correlation (.17). The relationship between the identification version and working memory may be likely due to common memorial processing. The data pattern with overall inspection time clearly indicates that mental speed has an independent influence on intelligence, along with working memory (as shown in Figure 5).

These findings should be considered in the understanding of individual differences in variables such as age, or even ADHD diagnosis. Controlled attention and working memory are disrupted in ADHD children and adults, however, more information is needed regarding mental processing speed (Payne & Steege, 2013; Kofler et al., 2010). It is possible that there are situations (task demands) or states of being (mood or language disorders) in which difficulty with one type of basic process, may lead to the potential for compensation with the other process. Future research should place emphasis on the causal factors of intra-individual

variation, and the potential for inter-individual variation, as well. Although this study used a standardized measure of a figural reasoning test to assess fluid intelligence, more emphasis could also be placed on situational demands and the impact of speed differences in early academics, such as learning to read, and everyday life activities.

Chapter 55

VISUAL RECOGNITION OF CHINESE COMPOUND WORDS IS A SERIAL PROCESS

*John Xuexin Zhang**

Department of Psychology, Fudan University, Shanghai, China

ABSTRACT

Compounding is an effective way to express new meanings by combining existing concepts. However, the resultant meaning involves not only the sum of meanings of the two constituent concepts but also the semantic relation between them. Compounding is particularly important for the study of Chinese word recognition as compound word is the dominant type of vocabulary in Chinese. The present commentary describes two recent studies using event-related potentials (ERPs) to examine the time course of lexical processing for Chinese compound words. In the first study, we reported the discovery of a novel ERP component, named the centro-parietal N200, which was elicited about 200ms after the onset of two-character words. Evidence suggests that this N200 reflects recognition of the two characters' orthographic form. In the second study, we used a relation priming paradigm and showed that the relation combining meanings of the two characters was activated in the N400 time window about 80ms later than the meaning activation of the individual characters. Together, the results indicate a clear serial process in reading compound Chinese words, first recognizing the word form around 200ms following word presentation, and then starting to retrieve each character's meaning at around 260ms, and finally integrating the two constituting meanings at around 340ms.

Keywords: Compound word; semantic composition; semantic relation; centro-parietal N200; ERP

INTRODUCTION

A fundamental question in reading research is how people recognize words, the basic units of a writing system. Currently, major word recognition models in English are built upon

* Corresponding Author Email: zhangxuexinjohn@gmail.com.

studies of simple words (Barber & Kutas, 2007). However, majority of the words in all languages are complex words consisting of several morphemes. While English relies mostly on inflection and derivation to construct complex words, according to a recent corpus study (www.chineseldc.org), Chinese relies mostly on compounding with over 81% compound words in its vocabulary.

One important question in compound word processing is whether these words are processed as a whole (treated as a single perceptual unit) or decomposed into smaller units of morphemes analyzed individually and then integrated for meaning access (e.g., Taft & Forster, 1975). Research has been carried out with behavioral, eye-movements, electrophysiological, neuropsychological, and functional imaging methodologies, leading to full-listing models emphasizing whole-word representations, full-parsing models arguing for automatic and obligatory morphemic decomposition, and dual-route models incorporating both whole-word access and morphemic processing (see Fiorentino & Poeppel, 2007 for review).

THE CENTRO-PARIETAL N200

Recently, we conducted a series of event-related potentials (ERP) experiments on the recognition of two-character Chinese compound words using an immediate repetition paradigm (Zhang et al., 2012). A new ERP response was repetitively observed which peaked at about 200ms following the onset of a compound word (Figure 1). This response was referred to as the centro-parietal N200 component as it showed a broad distribution with a focus in central and parietal electrode sites.

Figure 1. ERP responses elicited by two-character Chinese compound words. A centro-parietal N200 component shows amplitude enhancement upon repetition priming (indicated by the arrow). Gray line for control condition and solid line for repetition condition.

A very unusual characteristic of this component is that its magnitude is significantly enhanced when a word is presented the second time, which is the opposite to what has been typically observed in neural priming. For example, N400 shows amplitude reduction for repetition priming (Henson & Rugg, 2003). Further evidence shows that the N200 is not sensitive to semantic priming or phonological priming, suggesting its association with orthographical processing (Zhang et al., 2012). With face stimuli, Schweinberger et al. (2004) observed repetition priming effects on an N250r component but not the earlier N170

component. That is, for two faces successively presented, that N170 does not differentiate between two same faces and two different faces but N250r does. In their view, this indicates that the recognition of individual face exemplars has been achieved in the N250 but not the N170 time window.

Following this logic, our finding that the centro-parietal N200 (but not the earlier N170) shows repetition effect indicates that the orthographical recognition of Chinese words occurs in the N200 time window. That is, the N200 reflects recognition of the orthographic form of a compound word but not access to its semantic meaning. Therefore, semantic activation of the two constituent morphemes and/or the compound word as a whole should occur after N200, possibly in the N400 response. The study described below not only confirms this expectation but also provides further insight into the time course of compound word meaning activation.

RELATION PRIMING

When two morphemes are compounded to form a new concept, the resultant meaning involves not only the two constituent meanings but also the semantic relation between them. The phrase “dog scarf” can be understood as “a scarf for a dog to wear” when using the relation “for” or as “a scarf with a dog’s image” when using the relation “with” (Raffray et al., 2007). Following linguistics work characterizing the relations that can be used in forming compound concepts (e.g., Levi, 1978; Kay & Zimmer, 1976), a recent CARIN theory (Competition Among Relations in Nominals) proposes that compound concepts are formed by binding two constituents with a specific thematic relation (Gagné & Shoben, 1997) and such relations are important in the interpretation of compound concepts.

Gagné (2000) showed that responses to a compound (e.g., student vote, vote by a student) were faster when the compound was preceded by a compound involving the same relational structure (e.g., student accusation, accusation by a student) than when preceded by a compound involving a different relational structure (e.g., student car, car of a student). Such findings of relation priming are taken to indicate that the relation structure plays a role in compound concept interpretation. Further, relation priming was also found when interpreting familiar noun + noun compound words so that “snowman” (manmade of snow) primed “snowball” (ball made of snow) more than it primed “snowshovel” (shovel for removing snow) (Gagné & Spalding, 2004). Therefore, for familiar and lexicalized compound words, the whole word’s meaning is likely composed by integrating the two constituent meanings with some relation information.

TIME COURSE OF RELATION ACTIVATION

In addition to English, French and Indonesia, relation priming has also been demonstrated in behavioral studies for Chinese compounds (Ji & Gagné, 2007; Storms & Wisniewski, 2005). However, behavioral studies are not sufficient to provide direct evidence about the time course of relation activation in compound word comprehension. Towards this end, we conducted the first ERP study to identify the neural correlates of relation priming.

As in Ji and Gagné (2007), we presented lists of compound word pairs (prime-target) to participants and asked them to make sense-nonsense judgment on each word (Jia et al, 2013). There were three priming conditions, 1) Same condition: the prime and target shared the first constituent and the relation (问句-问号, questioning sentence-question mark); 2) Different condition: the prime and target shared the first constituent but differed in relation (问卷-问号, survey paper -question mark); 3) Neutral condition: the prime and target shared neither a constituent nor the relation (面纱-问号, cotton yarn-question mark). Mean response time was significantly faster for the Same condition than the Different condition (692 vs. 726 ms) and both were significantly faster than the Neutral condition (781ms). The error rates showed a consistent pattern.

The better performance in the Same and Different conditions than the Neutral condition could be attributed to their shared first morpheme resulting in both orthographical priming and semantic priming. Accordingly, the first two conditions elicited a clearly greater N200 response and a smaller N400 response, compared with the later condition (Figure 2).

Figure 2. ERP responses elicited by two-character Chinese compound words (targets) under three priming conditions. In the Same condition (thick black line), the target and prime shared the first constitute morpheme and the same relation. In the Different condition (thin black line), the two shared the same constitute morpheme but not the relation. In the Neutral condition (gray line), the two shared neither a constitute morpheme nor the relation. The N400 in the Same/Different conditions diverged from the Neutral condition at around 260ms (indicated by the left arrow), but the N400 in the Same condition diverged from the Different condition at around 340ms (indicated by the right arrow).

The better performance in the Same condition than the Different condition indicates the presence of relation priming. N400 was significantly reduced for the Same condition compared with the Different condition. As no other ERP responses differed across the two conditions, this N400 effect was interpreted to be a neural marker of relation priming.

The critical finding was the temporal order of the two above N400 effects. While for the Same/Different vs. Neutral comparison, the N400 effect started to emerge around 260ms, for the Same vs. Different comparison, the N400 effect started to emerge around 340ms.

As the first N400 effect reflects facilitated semantic processing due to the shared constituent, and the second N400 effect reflects the use of relation information, this pattern of results suggests a serial process. That is, the constituent meanings are activated before relation information is activated to construct the meaning of the whole compound word.

CONCLUSION

The western linguistics has been primarily focused on the study of spoken language, assigning written language a subordinate role for the service of recording speech. In reference to alphabetic scripts, written Chinese has generally been regarded as a logography script with poor sound-recording functions and hence being at the lower stage of written language evolution (Zhou, 1997). A recent meaning-spelling theory points out that at the vocabulary level, written Chinese is a meaning-spelling script (i.e., “piecing together” meaning-denoting visual symbols for the construction of new meanings) simulating the structure of semantic network of knowledge representation in human brain (Zhang, 2011). By this theory, Chinese is a highly mature script following a different route of evolution, differing in logical type from alphabetic scripts.

Among others, this theory makes two specific predictions. One is that Chinese word recognition should rely more on visual processing. The new finding of the centro-parietal N200 lends support to this prediction as it reflects a special processing stage devoted to orthography with no counterpart in English and other alphabetic scripts. The second prediction is that majority of Chinese words, which are compound words, should be comprehended via semantic composition, i.e., integration of individual morpheme meanings. Consistent with this prediction, we identified a temporal difference between morphemic activation and relation activation suggesting a two-stage decomposition-then-integration processing.

Briefly, the combination of neural indices of N200 and N400 and the phenomenon of relation priming offers a new approach to look into the time course of Chinese compound word recognition. The results we obtained so far argue against the notion of direct retrieval of whole word meaning but suggest a meaning construction process, in line with a new theory conceptualizing written Chinese as a meaning-spelling system.

Chapter 56

LEARNER AND TEACHER CHARACTERISTICS

Firdevs Karahan*

Sakarya University, Faculty of Education
Department of Foreign Languages Teaching
English Language Teaching Program, Sakarya, Turkey

THE GOALS OF THE CHAPTER

After reading the present chapter, students will be able to:

1. Define the most important characteristics of learners;
2. Discuss the relationship between these characteristics;
3. Debate the possible differences specific to Turkish culture and foreign language teaching context;
4. Describe the most important characteristics of teachers.

STUDY QUESTIONS

1. As a leading factor, how does age either facilitate or obstruct the process of language learning and teaching? Provide your arguments with specific examples.
2. What are the three learner styles? How do they play a role in assembling the strategies one employs while learning or teaching a language?
3. How do various learning theories define motivation? What are the implications of these definitions for language learners and teachers?
4. What are the main duties of a contemporary language teacher to follow the curriculum and reach the course objectives?

* Corresponding Author Email: firdevse@sakarya.edu.tr.

INTRODUCTION

In language teaching and learning, major roles belong to teachers and learners. Active involvement of these two parties necessitates profound background knowledge of factors which affects the process of learning and teaching language. Deriving from this knowledge, the teacher develops his skill in teaching; the learner learns how to become more successful in achieving his goal, i.e., to learn another language. This chapter will present the basic factors about learners and the basic characteristics of teachers.

LEARNERS

Learners are at the forefront in the language learning process. Without them, it would be impossible to talk about other factors in learning such as teachers, materials, methodology, and so on. There are several important characteristics of learners such as age, language aptitude, motivation affecting the learning process both in a positive and negative way.

AGE

It is generally believed that the younger the learner is, the easier it is to learn another language. Although starting to learn at a very young age gives the learner more opportunity to allocate more time to be in a learning process, there is not enough evidence that children in similar classroom situations are performing better than adults in language learning. It is true that adults have many advantages in terms of memory, organization skills, attention spans, study skills, and handling complex mental tasks. Since they have sturdy motivation, they can easily understand the necessity of learning a foreign language for educational or professional purposes. Moreover, they are more careful about accuracy and appropriateness of language use with right vocabulary.

Besides its advantages, age also has disadvantages. It is generally a requirement for adults to learn a foreign language in a limited amount of time, especially for professional purposes. They may also demand specifically to perform speech acts such as persuading, arguing, expressing concern, objection, explaining, and presenting information about complex issues related to their life, work or education. Since adults avoid making mistakes, they often shrink away from practicing for fear that they would appear foolish, incompetent, or not be able to get their message across. Moreover, it might be more difficult for adults to make friends speaking a foreign language.

Regarding age, the ease with which children can pick up an authentic accent sets a good example to support the superiority of young language learners over adults. But adults in need and with a strong motivation such as diplomats or those with an access to a wide range of opportunities to practice may acquire native-like accent. However, it may cause retention of their cultural and linguistic identity (Harmer, 2013).

Subsequent to general comments of students as children and adults on advantages and disadvantages, it might be good to mention their characteristics in general. But it should be

kept in mind that they are only generalizations, much depends on individual learner differences and motivation as Harmer (2013) notes.

Young Children

Children, up to the ages of nine or ten, reveal certain characteristics as:

- Although they do not understand the meaning of individual words, they respond to meaning.
- Since they learn from everything around them without focusing on a certain topic, they learn indirectly.
- They learn better through the five senses along with from explicit explanation.
- Abstract concepts are difficult for them to learn.
- Generally they have enthusiasm and curiosity to learn the world.
- They are in need to have individual attention and approval from the teacher and adults around them.
- They learn better by examples from themselves and their own lives.
- As they have a limited attention span, activities should be encouraging enough for them to engage in.

Within the childhood period, it is also important to consider changes. For example; games, puzzles and songs are better ways to learn for children at the age of 10 and 11 while dialogues, question-answer activities and matching exercises are more suitable activities for the ones at the age of 12 and 13 (Keskil and Cephe, 2001).

Adolescents

Teenage students are generally perceived as a group of learners difficult to manage despite their relative success as language learners with their greater ability for abstract thought and their passionate commitment to what they are doing once they are engaged (Harmer, 2013).

As teenagers are in search for identity and in need for self-esteem in this period, they all need to be valued and approved by not only adults around them but also their peers mostly. Disruptive behaviors in teenage classes and lack of enthusiasm to learn are the basic issues that teachers have to cope with by persuading the students to engage in learning process through relevant and involving materials.

Learning issues directly, discussing abstract notions, contrasting ideas and concepts with teacher's guidance, linking what they have learnt to their everyday interests are the ways adolescents apply in a humanistic learning environment where their self-esteem is reinforced and their search for identity is aided.

Adults

As language learners, adults have special characteristics. When compared with children and adolescents, adults' ability to engage with abstract notions, their previous experiences on which activities can depend, their expectations and own way of learning, their ability to overcome the feeling of boredom, their clear understanding of the reasons of learning that results in a high level of motivation, their ability to sustain their motivation level help teacher a lot in carrying out activities longer and involving them in a more conscious learning process. The most crucial issue for teachers is to deal with diminishing dreadful effects of their past learning experiences by offering achievable activities and adjusting the learning process according to their needs.

Activity 1

Observe 3-5 students at different ages in your neighbourhood and write at least 5 characteristics for each.

LANGUAGE LEARNING APTITUDE

Dictionary meaning of the word 'aptitude' is the ability and capability of doing something. It is a natural or acquired ability to properly perform some task and is believed to be a part of general intelligence but to be in part distinct.

John Carroll (1965) identified components of language aptitude as:

1. Phonemic coding ability: It is to identify the accepted sounds of a language and to handle sound-symbol relationships, for instance, to identify the sound which "w" stands for.
2. Grammatical sensitivity: It is to recognize the grammatical functions of words in sentences, for instance, the subject and object of a sentence.
3. Inductive language learning ability: It is to identify patterns of correspondence and relations between form and meaning, for instance, to recognize that in English 'to' can denote direction and 'at' location.
4. Rote learning ability: It is to form and remember associations between stimuli. This is believed to be important in vocabulary learning.

The results of researches on language aptitude in the 1950s and 1960s show that the higher score the learners have on language aptitude tests, the more rapidly they learn. However, different components of language aptitude may be implicated in different stages of processing. Phonemic coding ability seems to be relevant to the processing of input, grammatical sensitivity and inductive language learning ability to the central processing stages including interlanguage construction, memory to the storage and access of language but this assumption remains to be searched.

Regarding language aptitude tests, there have been a number of criticisms. Firstly, the content of these tests measured general intellectual ability rather than linguistic talents because they had mostly grammar-focused tasks. So, analytic-type learners had higher scores

than holistic learners as they use language in a more message-oriented way. Secondly, low scores adversely affected students and demotivated them in their future learning experiences. Moreover, teacher's treatment to students scoring low would inevitably be biased.

As a result of discussions on the language aptitude, the characteristics of 'good language learners' have been tried to be identified (e.g., Naiman, et al., 1978, Rubin and Thompson. 1982, Lightbown and Spada, 2006). The common points of the good learner characteristics can be listed as the tolerance of ambiguity i.e., learning to live with uncertainty, being positive towards learning, finding own way by using aspirations and creating opportunities to practice, being able to guess by using contextual clues, reasoning out of mistakes. This list can be longer but they have been put forward as a result of teaching practice in western-influenced methodologies (Harmer, 2013). Since these characteristics are to a significant extent culture-specific, training students in order to gain the qualities of an ideal learner requires great amount of time and effort in the process of 'learning to learn' as a combination of motivation and effective strategies. Moreover, learners who did very well in their formal education in language learning may not be highly competent outside classroom, especially with native speakers.

Activity 2

Survey the language aptitude tests e.g., "Modern Language Aptitude Test" on the web, discuss its components of your choice and comment on whether there are any contradictory issues in terms of its use within a Turkish EFL context.

LEARNER STYLES

'Style' is defined as individual tendencies or preferences and general characteristics of intellectual functioning and personality type that are pertinent to individual (Brown, 2000). While solving or approaching a problem, we make use of established link between our personality and cognition, i.e., our cognitive style. Referring to learning process, they are called 'learning styles.' According to Keefe (1979), learning styles include cognitive, affective and physiological traits as the steady indicators of how learners perceive, interact with, and respond to the learning environment. As learning styles are bridges between emotion and cognition, the selection of sensory, communicative, cultural, affective and intellectual factors (Ausubel, 1968, Hill, 1972, Reid, 1995, Ehrman 1996, Cohen, 1998 cited in Brown 2000) contribute a lot to successful learning.

Among learning styles, the field independent style enables the learner to distinguish parts from a whole, to concentrate on something, to analyze separate variables without negatively affected by the other ones. However, 'too much' field independency may lead the learner to deal only with parts but not to establish their relationship to the whole. A field dependent style may help the individual perceive the whole picture or general view of a problem, idea or event. So, both field independency and field dependency have their own place in learning process. In different cultures, children are raised with a general tendency towards being either field independent or field dependent. For example, in authoritarian or agrarian societies, individuals are more field dependent due to high socialization and strict rearing practices. In democratic, industrialized, competitive societies, the individuals tend to be more field independent due to freer rearing norms (Brown 2000).

As affective factors, it can be said that field independents are generally more self-reliant, competitive and self-confident, whereas field dependents are generally more socialized, empathetic and perceptive of the feelings and thoughts of others.

In language learning environments, researches disclose that field independents are more successful in analyzing, paying attention to details and doing exercises, drills, and other focused activities (Naiman et al., 1978, Hansen, 1984, Hansen and Stansfield, 1981, Stansfield and Hansen, 1983). On the other hand, field dependents display better results in inductive lessons and learning the communicative aspect of language.

These seemingly paradoxical results demonstrate that both styles are important. In face-to-face communication, the learner needs to be more field independent; in doing exercises, tests, he needs to be more field independent. Concerning age, compared to adults, children are predominantly more field dependent which can be considered as an advantage.

Depending on the context of learning, learners may vary in their utilization of being field independent or field dependent. So, choosing the appropriate style for the context is the point that the learner should be careful about and teachers should understand his learners' preferred styles.

The second learning style is related to right- and left-brain dominance. In the lateralization process throughout childhood, the left and right hemisphere become responsible for a diverse array of functions. The left hemisphere is for logical, analytical thought, with mathematical and linear processing of information. The right hemisphere is for the perception and remembering of visual, tactile and auditory images, the processing of holistic, integrative and emotional information. As Krashen, Seliger and Hartnett (1974) suggest, left-brain-dominant second language learner preferred a deductive style of teaching, while right-brain-dominant learners appeared to be more successful in an inductive classroom environment. The study by Stevick (1982) mentions that left-brain-dominants in language learning are better at producing separate words, gathering the specifics of language, carrying out sequences of operations, and dealing with abstraction, classification, labeling, and reorganization. Right-brain-dominant learners seem to deal better with whole images, with generalizations, with metaphors, and with emotional reactions and artistic expressions (cited in Brown 2000).

Activity 3

Studies reveal a strong relationship between field independency/dependency and left- and right-brain functioning. Find out the left- and right-brain characteristics in other sources or on the Internet and discuss the relationship by mentioning similarities and differences.

As the third style, ambiguity tolerance means the degree of cognitively willingness to tolerate ideas countering the individual's belief system or structure of knowledge. Relatively open-minded people can accept the contradictory ideas, ideologies, beliefs, etc. whereas more conservative people tend to reject different ideas as far as they do not fit their own perception. Regarding language learning process, both styles contribute a lot, especially ambiguity tolerance. Chapell and Roberts (1986) and Naiman et al. (1978) found that ambiguity tolerance is one of the important factors in successful language learning. As Brown (2000) suggests, "it is hard for a person who sees everything in black and white with no shades of gray ever being successful in the overwhelmingly ambiguous process of learning a second language."

Being reflective or impulsive is another important tendency in cognitive domain. Reflective people are slower and more calculated in making decisions, whereas impulsive people make a quick or gambling guess at an answer to a problem. According to studies (Kagan, 1965; Goodman, 1970; Kagan, Pearson and Welch, 1966; Doron, 1973; Jamieson 1992):

- Reflective people are slower, e.g., in reading and make fewer mistakes but impulsive people read fast and make guesses a lot.
- Reflective people are better in inductive reasoning.
- Learners who are impulsive are good guessers in tests.

So, for language teachers, it is important not to react harshly to the answers of impulsive learners and to be more patient to allocate more time for reflective learners.

Last but not least, learning style is the preference of learners towards visual or auditory input. Visual learners choose mostly visual aids like drawings, pictures, charts, figures, etc. while auditory learners prefer listening to lectures and other listening materials. In the same path with other learning styles, both are implemented by most successful learners.

Activity 4

Within the context of ambiguity tolerance, visual and auditory learning styles, discuss the effect of culture.

LEARNER STRATEGIES

‘Strategy’ is the specific method of approaching a problem or task, modes of operation for achieving a particular end, planned designs for controlling and manipulating certain information (Brown, 2000). In second language learning, it is possible to distinguish two strategies: learning strategies and communication strategies.

Learning strategies are related to how the individual takes input, i.e., how to process, store and retrieve the given information, while communication strategies are about output, i.e., how to express meaning. During 1970s, studies proved the important role of learners including variation in learning process. So, personal characteristics, styles and strategies of ‘good’ or ‘successful’ language learners were enumerated and these characteristics are used as pieces of advice to be better language learners (e.g., Rubin, 1975; Stern, 1975; Rubin and Thompson, 1982; Naiman et al., 1978; Brown, 1991; Marshall, 1989).

In compliance with the scope of the study, the list of learning and communication strategies will be given as an encapsulated summary. If a teacher training program has enough time and space, a course on strategies-based instruction would be very helpful for prospective teachers.

Learning Strategies

- A. Metacognitive strategies: They involve organizing, planning for learning, thinking about the learning process as it is taking place, monitoring of one's production or comprehension, and evaluating learning after an activity is completed (Purpura, 1997). It can be exemplified as being an advanced(?) organizer, directing attention, selective attention, self-management, functional planning, self-monitoring, delaying production and self-evaluation (O'Malley et al., 1985).
- B. Cognitive strategies are limited to specific learning tasks and involve more direct manipulation of the material itself as the processes of repetition, resourcing, translation, grouping, note taking, deduction, recombination, using imagination, auditory representation, using keywords, contextualization, elaboration, transfer and inferencing (O'Malley et al., 1985).
- C. Socioaffective strategies are to do with social mediating activity and interacting with others. They could possibly be formulized as cooperation and asking questions for clarification (O'Malley et al., 1985).

Communication Strategies

- A. Avoidance strategies are applied when the learner is not sure about the right lexical item or appropriate pronunciation. He may also avoid the topic of the conversation by changing the subject, pretending not to understand or not responding at all (Dörnyei 1995).
- B. Compensatory strategies cover circumlocution (e.g., the thing you open bottles with for *corkscrew*), approximation (e.g., *ship* for *sailboat*), use of all-purpose words (e.g., thing, stuff), word coinage (e.g., *vegetarianist* for *vegetarian*), prefabricated patterns (e.g., Where is the?), nonlinguistic signals such as mimes, gestures, facial expressions, literal translation, foreignizing (e.g., adding to L1 lexical item a L2 suffix), code-switching, appeal for help and time-gaining strategies (e.g., *well, now let's see*).

Activity 5

Regarding characteristics of 'good language learner', add more in terms of Turkish educational context.

THE AFFECTIVE DOMAIN

In relation to learning another language, different degrees of specific personality factors such as self-esteem, inhibition, risk-taking, anxiety, empathy, and extroversion contribute a lot to the performance of the learners either in a positive or negative way.

Self-esteem is defined as the personal evaluation and judgment including the attitude of approval or disapproval, the feeling of worthiness, and the subjective experience. The 'global' self-esteem is stable and resistant to change. The self-appraisal of the individual depends on

the assessment of one's own worth over time and different situations. The 'situational' self-esteem is one's self-appraisals in particular life situations. The 'task' self-esteem refers to particular tasks within specific situations, for example one's self-evaluation of particular aspect of the process: speaking, writing, a particular class in a second language.

Inhibition is pertinent to defenses to protect the ego. In language learning, making mistakes is inevitable, which causes a growth in tension students have. Taking on a new identity may lead to some degree of identity conflict. For similar reasons, the learner may hinder himself from practicing in learning environment.

Risk-taking which is a continuum from high to low means to gamble, to be willing to try out hunches about the language and take the risk of being wrong (Brown, 2000). In order not to feel embarrassed or appear foolish, learners may prefer to keep silent and be reluctant to take risks.

Anxiety is defined as the feelings of uneasiness, frustration, self-doubt, apprehension, or worry (Scovel, 1978 cited in Brown, 2000). It has different levels: The 'trait' anxiety is global, i.e., a person is anxious about numerous matters, whereas the 'state' anxiety refers to a specific event or an act. In language learning, language anxiety is concerned with state anxiety which primarily manifests itself in self-expression, social and academic evaluation. The degree of anxiety functions as an arbiter since it can either be 'harmful' (debilitative) or 'helpful' (facilitative). As it is known, facilitative tension keeps one alert and enough amount of feeling of nervousness is a stimulating factor in the learning process, whereas debilitative anxiety may preclude the learner from taking notice of his real performance.

Empathy generally refers to understanding how another person is feeling. It necessitates an awareness and knowledge of one's own feelings and identification with another person (Hogan, 1969 cited in Brown, 2000). So, empathy means not only knowing someone else but also being aware of yourself. The language learning process requires the learner to have a certain degree of empathy towards the target culture and other learners within the learning environment.

Together with its counterpart i.e., introversion, extroversion is a term used to define people who are talkative, outgoing but having a need to receive affirmation of other people for a sense of wholeness. On the other hand, introversion characterizes people who are silent and reserved but also can have a sense of wholeness and fulfillment derived from an inner strength of character. Moreover, being extrovert or introvert, carrying out different assets and liabilities may vary across different learner groups, and it's sensitive to cultural norms.

Activity 6

As teachers, how can we measure the affective domain of our students? Search about the different tools and discuss the problems that such tools present.

MOTIVATION

For language teachers, it is crucial to describe the components of motivation, motivated people's behaviors, and the ways of creating motivation for language learners.

Different learning theories have provided definitions of motivation from different aspects. Behaviorism describes motivation as a factual matter, i.e., acting towards reward

using generally external factors. On the other hand, cognitivists define motivation as the individual's decisions based on personal needs and forces which are grouped as the need for exploration i.e., probing the unknown, manipulation i.e., changing the environment, activity i.e., physical and mental movement, stimulation i.e., being actuated by others and the environment, knowledge i.e., to process, internalize, the results of the previous needs and moving on to the next step in the systems of knowledge and ego enhancement i.e., self-realization. For constructivists, motivation is shaped not only by the individual himself but also by the social context. A hierarchy of needs is defined by Maslow (1970) who considered motivation as dependent on the satisfaction of fundamental physical necessities, community, security, identity, and self-esteem; all of which lead the individual to self-actualization.

Regarding language learning process, Ellis (2003) states that language aptitude deals with the cognitive abilities, on the other hand, motivation includes the attitudes and affective states influencing the degree of effort made by learners. Four types of motivation have been identified as instrumental, integrative, resultative, and intrinsic.

Instrumental motivation defines functional reasons to learn an L2 such as educational and economic opportunities. Integrative motivation refers to the interest of learners in the people and culture of the target language. Since integrative motivation may be seen as the cause of L2 achievement, resultative motivation is the result of learning, i.e., learners achieving success in learning may become more motivated. Lastly, intrinsic motivation includes the personal curiosity and interest in learning itself.

The nature of motivation is complex and dynamic. These four types of motivation are complementary rather than distinct issues, and subject to change depending on the learning context.

Activity 7

Considering the Turkish learners of English or any other foreign languages, discuss the factors that may motivate and demotivate them to learn.

TEACHERS

Since foreign/second language teachers having a crucial role in learning process are supposed to pave the way for changes in learners' behavior, attitude, knowledge, habits or skills in an unfamiliar language; they are to be a combination of linguist, sociologist, anthropologist, pedagogue, (Finocchiaro and Bonomo 1973) and even an artist at times.

As a teacher, while following the curriculum and striving to reach the course objectives, he should be able to

1. Select the right course material by taking into consideration the learners' age, proficiency level, interests, learning styles, etc. at the beginning of the language teaching program.
2. Adapt or modify the content provided by the course materials depending on the learners' needs, motivation, learning strategies, etc.

3. Utilize the available instructional materials at utmost level possible, as well as supplement additional materials in relation to students' characteristics and needs.
4. Act as a carrier of culture, that is, introduce the features of the target language culture in a comparison to the native context along with the language itself.
5. Keep the motivation of his students at a high level not only by implementing various methods and techniques but also by creating a positive atmosphere where the learners feel secure, successful and triumphant.
6. Conduct a variety of activities addressing the learners with different learning capacities, skills, styles and strategies by organizing the learning experiences carefully in order to facilitate the learners' acquisition.
7. Systematize not only habit formation but also meaningful use of the language as used by the native speakers.
8. Keep the previously learned language items alive by fostering necessary learning strategies.
9. Implement right ways of classroom management such as whole, group, peer, or individual work where it is necessary in accordance with the activity requirements.
10. Incorporate activities requiring simultaneous implementation, e.g., setting the CD while practicing listening and writing task concurrently.
11. Approximate in-class activities to the authentic practices of students to let them engage in a true-to-life atmosphere by integrating diverse language skills into communication situations and simulating the real ones where learners will need to use the foreign language.
12. Follow students' performance regularly through tests, portfolios, projects, etc. in order to check learners' achievement, to diagnose individual learning problems, and to reflect on his own performance in teaching.

Encourage students to take advantage of facilities provided by self-access centers to create and enhance opportunities inside and outside the classroom/school for the learners where they can actively involve.
13. Follow new techniques, technology, materials by establishing good relations with other colleagues and participants in language teaching professional world.

The key roles of a good language teacher can be summarized as “planner,” “organizer,” “guide,” “coach,” and “researcher.” Many other roles can be added to this list since the teacher's role is subject to change according to the teaching environment including not only the classroom but also the school and the society.

Qualifications of teachers include three important issues: 1. Personal qualities, 2. Well-balanced education including knowledge of his own language and culture, and 3. Training in professional education and psychology. Regarding the language proficiency level of the teacher, Finocchiaro and Bonomo (1973) adapted the standards prepared by the Steering Committee of the Modern Language Association as;

	Minimal	Good	Superior
Aural understanding	The ability to get the sense of what an educated native says when he is enunciating carefully and speaking simply on a general subject.	The ability to understand conversation at average tempo, lectures, and news broadcasts.	The ability to follow closely and with ease all types of standard speech, such as rapid or group conversation, plays and movies.
Speaking	The ability to speak on prepared topics (e.g., for classroom situations) without obvious faltering, to use the common expressions needed for getting around in the foreign country, and to speak with pronunciation readily understandable to a native.	The ability to talk with a native without making glaring mistakes and with a command of vocabulary and syntax sufficient to express one's thoughts in sustained conversation. This implies speech at normal speed with a good pronunciation and intonation	The ability to approximate native speech in vocabulary, intonation, and pronunciation (e.g., the ability to exchange ideas and be at ease in social situations).
Reading	The ability to grasp directly (i.e., without translation) the meaning of simple, non-technical prose, except for an occasional word.	The ability to read with immediate comprehension prose and verse of average difficulty and mature content.	The ability to read, almost as easily as in the native tongue, material of considerable difficulty, such as essays and literary criticism.
Writing	The ability to write correct sentences or paragraphs such as would be developed orally for classroom situations, and the ability to write, a short, simple letter.	The ability to write a simple "free composition" with clarity and correctness in vocabulary, idiom, and syntax.	The ability to write on a variety of subjects with idiomatic naturalness, ease of expression, and some feeling for the style of the language.
Language analysis	A working command of the sound patterns and grammar patterns of the foreign language, and a knowledge of its main differences from the native language of the learners.	A basic knowledge of the historical development and present characteristics of the language, and an awareness of the difference between the language as spoken and as written.	The ability to apply knowledge of descriptive, comparative, and historical linguistics to the language teaching situation.
Culture	An awareness of language as an essential element among the learned and shared experiences that combine to form a particular culture, and a rudimentary knowledge of the geography, history, literature, art, social customs, and contemporary civilization of the foreign people.	First-hand knowledge of some literary masterpieces, an understanding of the principal ways in which the foreign culture resembles and differs from our own, and possession of an organized body of information on the foreign people and their civilization.	An enlightened understanding of the foreign people and their culture achieved through personal contact, preferably by travel and residence abroad, through study of systematic descriptions of the foreign culture, and through study of literature and the arts.
Professional preparation	Some knowledge of effective methods and techniques of language teaching.	The ability to apply knowledge of methods and techniques to the teaching situation (e.g., audio-visual techniques) and to relate one's teaching of the language to other areas of the curriculum.	A mastery of recognized teaching methods, and the ability to experiment with and evaluate new methods and techniques.
Activity 8 Think about teachers you had throughout your education and state why they were 'good' or 'bad' teachers.			

CONCLUSION

Teaching profession necessitates the participants to have a high level of awareness of the personal factors affecting the learning process. Teachers should not only be equipped with theoretical knowledge about them but also with the ability to identify and handle all possible teaching situations where individual differences appear as the leading factors. Since promoting the learner's performance requires knowing the personal factors including strengths and weaknesses, and working on them by applying suitable techniques, teachers have the key role in raising the learners' awareness of them, and creating the necessary conditions and opportunities to facilitate the learners' improvement in language learning. For learners, having enough amount of information about themselves, their needs, and how to develop and meet them would contribute a lot in becoming an independent and successful language learner due to the fact that a language consists of a huge amount of forms, functions and meanings which cannot be taught solely by the teachers. Learning to learn will make the learners autonomous and efficient in their journey.

Chapter 57

LESSON PLANNING IN LANGUAGE TEACHING

Banu Inan Karagul*

Kocaeli University, Faculty of Education
English Language Teaching Department, Izmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading the present chapter, students will be able to:

1. List the most important elements that should exist in a lesson plan.
2. Identify the significance of lesson planning in the process of language teaching.
3. Define what syllabus is and different types of syllabi.

STUDY QUESTIONS

1. Is it necessary to plan a lesson? If yes, how should it be prepared?
2. What are the most important elements that should exist in a lesson plan? How should they be organized?
3. What is syllabus? How many different types of syllabus do you know?
4. How does syllabus affect lesson planning?

INTRODUCTION

Planning is a necessary step no matter what business you are involved in if you want to achieve your goals. If we consider teachers as “the managers” of the student learning, s/he also needs to know exactly what s/he intends to do in the class. There are four main things that a teacher needs to know before going to the class to teach:

* Corresponding Author Email: banu_inan@yahoo.com.

- the aim of the lesson
- what new language the lesson contains
- the main stages of the lesson (when and how to organize different activities)
- what to do at each stage

A lesson plan is a very useful tool which can be seen as a combination of guide, resource, and historical document reflecting our teaching philosophy, student population, textbooks and most importantly, our goals for our students (Jensen, 2001). Jensen also suggests that “a lesson plan is essential for novice teachers and convenient for experienced teachers” (p.403).

WHY SHOULD TEACHERS PLAN LESSONS?

Teachers should plan lessons so as to:

- achieve the objectives
- prepare and use a variety of teaching-learning activities
- select and prepare appropriate teaching-learning resources
- be able to time, sequence and link the stages of a lesson effectively in the class
- use the learning/teaching materials in an organized way
- organize groupwork/pairwork activities effectively

Before a teacher starts teaching, s/he should have developed his/her own understanding of second language learning/teaching. Knowledge of theories of SLA, learner characteristics, historical and current trends in second language pedagogy are some examples for teachers to take into consideration while they are developing their ideas. This stage is called “*pre-planning stage*”. In this stage, the teacher may benefit from a variety of sources (Harmer, 2007); namely, teachers’ seminars, internet, TV. At this stage, it is important to pay attention to the learners’ level, their personalities, and the requirements of the syllabus.

Syllabus is one of the most important components of lesson planning. According to Ur (1996, p.176), a syllabus is “a document which consists, essentially, of a list”. She lists the characteristics of a syllabus in the following way:

1. It consists of a comprehensive list of *content items* (words, structure, topics) and *process items* (tasks and methods).
2. It is ordered (easier, more essential items first).
3. It has explicit objectives (usually expressed in the introduction).
4. It is a public document.
5. It may indicate a time schedule.
6. It may indicate a preferred methodology or approach.
7. It may recommend materials.

There are many different types of syllabi suggested for language teaching. They are not totally different from each other. Although different types of syllabi are presented, in practice,

they rarely appear independently. Ur (1996, p.178) lists some of the most common syllabus types in the following way:

- a) Grammatical Syllabus: A list of grammatical structures, such as relative clauses, the simple present tense, usually divided into sections graded according to difficulty and/or importance.
- b) Lexical Syllabus: A list of lexical items (man, woman, go out...) with associated collocations and idioms, usually divided into graded sections.
- c) Grammatical-Lexical Syllabus: A very common kind of syllabus: both structures and lexis are specified: either together, in sections that correspond to the units of a course, or in two separate lists.
- d) Task-Based Syllabus: This type of syllabus is based on Task-Based Learning, an approach where learners can carry out tasks such as solving a problem or planning an activity. The language learnt comes out of the linguistic demands of the activity. A task-based syllabus is structured around a series of these tasks.
- e) Topic-Based Syllabus: It takes real life contexts of language use as its basis and headings are broadly topic-based, including things like “Food” or “The family”; these usually indicate a fairly clear set of vocabulary items, which may be specified.
- f) Functional-Notional Syllabus: Notions are concepts that language can express such as time, place, whereas functions are things you can do with language such as identifying, denying. In these syllabuses, functions and notions are combined.
 - According to Ur (1996, p.92), a notion is a concept, or idea: it may be quite specific, in which case it is virtually the same as vocabulary (dog, house, for example); or it may be very general –time, size, emotion –in which case it often overlaps with the concept of ‘topic’. A function, on the other hand, is some kind of communicative act: it is the use of language to achieve a purpose, usually involving interaction between at least two people.

TASK 1: Look at the following list and decide which of them are functions (F) and which of them are notions (N)

Location	advice	threat
Food	money	crime
Complaint	suggestion	apology

(adapted from Ur, 1996, p.93).

- g) Mixed or Multi-Strand Syllabus: Increasingly, modern syllabuses are combining different aspects in order to be maximally comprehensive and helpful to teachers and learners; in these you may find specification of topics, tasks, functions and notions, as well as grammar and vocabulary.

Basic Principles of Lesson Planning

Jensen (2001, p.406-407) states that there are some basic principles to be taken into account while planning a lesson, which are:

1. *A good lesson plan has a sense of coherence and flow.* No matter what the subject is, a lesson does not consist of a sequence of discrete activities. For teachers, it is important to connect the various lessons over the days and weeks of a course. In addition, students need to understand the rationale for each activity and they can learn better if they see the connections between activities.
2. *A good lesson exhibits variety.* A certain degree of predictability in terms of the teacher, the texts, classmates, and certain administrative procedures is comforting; however, to avoid boredom and fatigue, lesson plans should not follow the same pattern day after day. In addition, there should be variety in terms of topics (content), language, and skills over the length of the course.
3. *A good lesson is flexible.* When a lesson is planned, it does not mean that the teacher has to follow it strictly. Good teachers know when it is time to change an activity, regardless of what the lesson plan says. A question posed by a student out of the blue may change the direction of the lesson and may lead to teaching a related topic.

What Should Be Included in a Lesson Plan?

Since there are different teaching institutions with different systems, it is impossible to say exactly what a plan should be like. There are a variety of formats to be used but the teacher should consider the background of the students, the objectives of the lesson, the skills to be taught, the activities, the materials and texts, the time constraints, and the connections to previous and future lessons (Jensen, 2001, p.404). However, there are a number of elements that are always present in most of the lesson plans.

TASK 2: Work in groups and discuss which of the elements of lesson plans you would use in a lesson plan for teaching English and circle the related numbers

Elements of lesson plans

1. number of learners	11. aids used	21. different colors for important points
2. overall aims	12. timing of each stage	22. review of last lesson
3. aims of each stage	13. skills practiced	23. sex of learners
4. coursebook used	14. page numbers	24. short description of each activity
5. numbers of exercises/activities	15. anticipated problems	25. level of class
6. what the learners do at each stage	16. new vocabulary	26. time of class
7. what the teacher does at each stage	17. extra activities	27. name/number of class
8. materials used	18. age of learners	28. length of class
9. homework	19. the date	29. which learners work together
10. groupings of learners (individuals/pairs/groups/ whole class)	20. interaction (e.g., S-S, S-T)	30. abbreviations (e.g., L= learner)

(Tanner & Green, 1998).

The following components take place in most of the lesson plans no matter what the subject matter and the formats are:

Aims

Aims are considered to be one of the most important elements in a lesson plan. According to Harmer (2007, p.371), the aims in a teacher's lesson plan are "the outcomes which all our teaching will try to achieve –the destinations on our map". Aims should be associated with what we expect our students to do, not related to what we are going to do. Harmer (2007) suggests the following criteria to describe lesson aims:

- a. Specific
- b. Measurable
- c. Achievable
- d. Realistic
- e. Timed

Tanner & Green (1998, p.102) mentions the following types of aims that can be included in a lesson plan:

Type of Aims	Examples
Topic aims	Learners discuss capital punishment
Grammar aims	Learners practise Present Perfect Tense by writing a grammar exercise from the book.
Communication aims	Learners talk to each other about what they do every Saturday.
Vocabulary aims	Learners listen for all the words related to school.
Function aims	Learners learn how to complain in a shop.
Skill aims	Learners write a holiday postcard.
Pronunciation aims	Learners identify the difference between /ɪ/ and /i:/ sounds.
Group dynamics aims	Learners discuss their learning experience this term.
Reviewing aims	Learners revise the vocabulary from the last unit.
Cultural aims	Learners read about recent political events in an English-speaking country.
Organizational aims	Learners correct last week's homework in the workbook.

Class Profile

This part includes a short description of who the students are, the number of the students, their level, their genders, etc. If the number of the students in a class is small, more detailed information about the individual students might be included in the lesson plan as well, e.g., *A is very silent but usually good at writing activities. B likes to participate in classroom discussions but does not submit his/her assignments on time.*

Procedure

In this part of the lesson plan, the steps or stages of the lesson, which are necessary to ensure that the lesson aims are achieved, are included. Activities, transition notes, as well as time management and class management notes such as the students' seating arrangements for different activities are the other important components included in this part. In addition to these, it is a good idea to include the indications of what you will do, what the students will

do, how long you expect it to last, what kind of interaction there will be, what the aims of each stage are, etc.

While preparing this part of the lesson plan, it is a good idea to ask the following questions:

- How much time do I have?
- How will I divide up the lesson into stages?
- How much time will each stage take?
- What will be the aim of each stage?
- How will the stages be linked? (Gower, et al., 1995).

In this part of the lesson, the teacher also details classroom interactions. Who will interact with whom ($T \rightarrow S$, $T \rightarrow SS$, $S \rightarrow S$), how long will each activity take, what techniques should be used, etc. are some of the details that could be included in the lesson plan.

There are different types of lesson procedures that might be adopted by the teachers while teaching English in an EFL/ESL context. Here are some of the most commonly used ones:

1. *The PPP (Presentation-Practice-Production) Model*: This procedure has been the most traditional classroom procedure since Audiolingualism was suggested as a language teaching method. In the Presentation part of the procedure, the new language form is presented to students either deductively or inductively. Visual materials, songs, video clips, stories are other forms of presentation. In the Practice part of the procedure, students have the chance to practise the new language form presented in the first part. This practice may be done through some drills or exercises. In the Production part of the procedure, students are asked to produce utterances including the newly-studied language form. They may be asked to write sentences, paragraph or do a role-play.

2. *The ESA (Engage-Study-Activate)*: This procedure was suggested by Jeremy Harmer as an alternative to the traditional PPP Model because of the criticisms stating that in such a procedure, lessons are teacher-centered and students are passive. In this alternative procedure, the lesson starts with an Engagement part in which teachers aim to engage students emotionally. This can be achieved through some warm-up activities, games or any activities that students might find interesting. In the second part of the procedure, Study, the lesson focuses on how a language form is constructed. Teachers can directly emphasize a grammatical form or draw students'

attention to a language form in a communicative task. Activate is the last part of the procedure. In this part, students are encouraged to use the language meaningfully with the help of some communicative tasks.

3. *The OHE (Observe-Hypothesize-Experiment)*: This procedure is the one that was suggested as a way of teaching vocabulary in *The Lexical Approach* by Michael Lewis. In the first part of the procedure, students observe language in use through listening to or reading a text. Then, they hypothesize about how language works. In the last step of the procedure, they try to experiment it by using them in new contexts.
4. *Pre-task, Task Cycle, Language Focus*: This is the course sequence which is used in Task-Based Language Teaching contexts. In the Pre-Task stage, the teacher and the students try to explore the topic together and the instructions of the task are clarified. In the Task-cycle stage, including three subtitles, which are Task, Planning and Report, the students work together so as to perform the task; afterwards, they plan how they will tell their friends what they did, and then, they report on the task either orally or in the written way. In the last stage of the procedure, Language Focus, students and the teacher work on specific linguistic features of the task and/or they can do some exercises based on the problems that appeared in the previous stages.

Anticipated Problems

No matter how careful or experienced you are, there is always a possibility of having problems in your lessons. A good lesson plan “tries to predict potential pitfalls and suggests ways of dealing with them” (Harmer, 2007, p.373). It is a good idea to include a part related to “anticipated problems” and “possible solutions” in your lesson plan as the one in the following:

<i>Anticipated Problems</i>	<i>Possible Solutions</i>
Students may have difficulty in understanding the difference between “should+have+V3” and “must+have+V3” structures.	I will prepare extra worksheets including different examples with these structures and exercises.

This part is also important in case of problems related to time management, class management and classroom organization. Gower, et al. (1995, p.178) state that it is a good idea to think about what you would do if:

- the students take a longer or shorter time to do the activities than you had planned;
- they find an activity easier or more difficult than you thought they would;
- some students finish before the others;
- there are some students who need extra support;
- there are uneven numbers for a pair work activity;
- some or all of the students have already met the material you have based your lesson round: for example, they have already seen the video you were planning to show.

Materials, Aids and Equipment

Teachers should ask themselves “what materials, aids or equipment will I need at each stage of my lesson?” They should make a note in their lesson plan of when they will use these materials and aids.

A Sample Lesson Plan

(Adapted from Harmer, 2007).

Reading Text

Jane Williams was a young girl in the 1960s. Read what she says about it.

I was a young girl in the 1960s. I used to do many things that I don't do anymore. I used to dance to the music of Elvis Presley and the Beatles. I used to watch films with Marlon Brando and Elizabeth Taylor. I used to smoke a lot, wear very short skirts, and go fishing with my father. I didn't use to attend most of my courses instead; I used to drive to Brighton with my boyfriend. I used to argue with my mum a lot because I used to spend a lot of time away from home. I miss those days so much.

Aims

1. To give students practice in reading for detail.
2. To enable students to talk about what they used to do when they were younger.

Class Profile

The students in this pre-intermediate class are between the ages of 20-25. There are 10 girls and 15 boys. Since the class starts at 8.00 a.m., students are a bit sleepy in the first lesson; however, they become more active and enthusiastic after the break time. They like visual materials and listening to songs in English.

Anticipated Problems and Possible Solutions

Students might have difficulties in using “Used to” in positive and negative sentences and questions. In order to cope with this problem, extra exercises might be supplied by the teacher.

A Sample Procedure (Adapted from Harmer, 2007)

	Activity/Aids	Interaction	Procedure	Time
1	Making comparison and contrast	S ⇄ S	Students work in pairs and make a comparison between now and 100 years ago Students write down the ideas that they have come up with.	4”
	Pen and paper	SS		3”
2	Reading	S,S,S	Students read the text individually	3”
3	Language study	T ⇄ C	T elicits sentences from the text including unfamiliar grammar structures and then explains the use of “used to” in English. <i>I used to do many things that I don't do anymore.</i> <i>I used to dance to the music of Elvis Presley and the Beatles.</i>	10”
4	Textbook page.....	T ⇄ S, S,S	<i>I didn't use to attend most of my courses</i> T has SS do the exercises in the book	15”
5	Discussion	S,S,S	Students talk about what they used to do when they were younger	3”
6	Role-Play	SS ⇄ SS	Students do the role-play between Jane and the journalist	2”

Alternatives to Formal Planning

Even though there are important reasons why teachers need to plan their lessons, it is not carried out in practice very frequently. According to Gower and Walters (1995, p.129), there are various reasons behind this:

- teachers haven't got time
- the lesson methodology they wish to use cannot easily be characterised using the suggested formats
 - it doesn't seem an economical or helpful way of describing a lesson's way of working
- it might restrict teachers' freedom to respond to learners in class
- the lesson content and/or aim will emerge during the class rather than pre-decided
- teachers' priority is to create a specific atmosphere, a certain type of rapport, etc.
- teachers may want to experiment or work on specific aspects of their teaching

Instead of preparing a formal lesson plan, Gower and Walters (1995) suggest the following alternatives:

1. *Half-Plan*: This alternative might be preferred by experienced teachers or by the ones that are self-confident about their own language awareness and of their own ability to quickly think of mini-activities. Put your energy into planning how your class will do skill work (e.g., reading, speaking, etc.). Don't plan any work related to the language system. In class, spontaneously work on language issues as they come up if they are useful, interesting and appropriate for students.
2. *Focus on the "Critical Learning Moments"*: Instead of planning the entire lesson procedure, before the class, decide on a number of specific key things you hope learners will gain from the class. For each of these, decide what the "critical learning moment" will probably be, i.e., which thing you or they do (lasting no more than 30 seconds) that is likely to make the most significant impact on their success and –why. Think through each of these moments very carefully.
3. *Plan the "Critical Teaching Moments"*: Which instructions, explanations, feedback stages, etc. will be 'critical moments' for you, the teacher, which may need to be prepared in detail in advance?
4. *The Jungle Path*: An alternative approach would be to not predict and prepare so much, but to create the lesson moment by moment in class, with you and learners working with whatever is happening in the room, responding questions, problems and options as they come up, and finding new activities, materials and tasks in response to particular situations. The starting point might be an activity or a piece of material, but what comes out of it will remain unknown until it happens.

CONCLUSION

No matter what the topic is, planning before taking further steps is an important issue. When teaching is taken into consideration, planning step will include important components such as determining the aims, lesson procedure, anticipated problems and possible solutions, etc. Even though most teachers prefer to follow the coursebook, which they find safer and easier, planning at least the main structure of the lesson will be beneficial especially for teachers who are in their initial years of their teaching experience. With the help of such a plan, it will be easier for teachers to manage the time in the classroom, foresee some potential problems and come up with solutions to them.

Chapter 58

MICROTEACHING IN ELT

Dogan Yuksel

Kocaeli University, Faculty of Education
English Language Teaching Department, Izmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. define microteaching
2. list different roles different participants play during microteaching
3. list the major stages of microteaching
4. discuss the basic benefits of using microteaching in language teaching

STUDY QUESTIONS

1. Have you had any teaching experience before? If yes, where did you teach? Who were your students?
2. What were (might be) some problems that you may encounter while teaching?
3. Which part of teaching is the most difficult? Classroom discipline or presenting the information?
4. How would you feel when/if your teaching performance was videotaped?

INTRODUCTION

Most of the undergraduate and graduate level English Language Teaching programs offer courses in Linguistics, Language Acquisition, Approaches and Methods, Methodology and Teaching Language Skills as well as Practicum and School Practice. All of these courses provide the necessary skills and knowledge to help student teachers become skillful and adept practitioners. Usually, Practicum and School Practice courses are offered late in the program.

Until the Practicum and School Experience courses, many of the foundational courses in ELT programs do not focus on the practical aspect of teacher preparation. Microteaching, as a technique for teacher education, can address some of these problems and help the student learn the process of becoming practitioners while they are taking some basic foundational courses. It is also commonly used as a component of in-service teacher development programs for various types and stages of professional development (Kpanja, 2001). This training procedure focuses on the simplification of the complexities of the regular teaching-learning process by minimizing any of these aspects: class-size, time, task and content (He & Yan, 2011). It also adds the immediate and delayed feedback opportunity from various resources.

Microteaching

Microteaching as a structured classroom technique dates back to the 1960s. It was first introduced at Stanford University's Educational and Research Development unit. It is defined as a scaled-down, simulated teaching experience designed for the training of both pre-service and in-service teachers. It mainly aims to equip (student) teachers with the tools to attain the practice of some basic teaching skills in any given subject or skill in a controlled and relatively safe environment. It also facilitates the promotion of real-time teaching experiences (Remesh, 2013). Originally, when it was first introduced, microteaching aimed to serve three purposes: (1) as a preliminary experience and practice in teaching (2) as a research vehicle to explore training effects under controlled conditions, and (3) as an in-service training instrument for experienced teachers (Allen, 1966). However, with its development in the last 40 years, it has evolved both in shape and content.

Microteaching can help students practice some basic teaching techniques such as introducing and closing lessons, using a whiteboard effectively, questioning, giving corrective feedback, presenting specific topics, using ICT materials, applying lesson plans effectively, and so on. It can also be used to practice teaching skills such as speaking, listening, writing etc. One of the main advantages of microteaching is the opportunity for the presenter to receive immediate focused feedback just after the teaching practice. The reflection process at the end of the session has additional advantages.

Activity 1

If you were to microteach, which of the skills below would your first preference be to practice and why?

introducing and closing lessons,
using whiteboard effectively
questioning
giving corrective feedback
presenting specific topics
using ICT materials
applying lesson plans effectively

There are two different metaphors about the microteaching technique. As it is scaled down, it is usually referred as ‘teaching under a microscope’. With this metaphor, the scrutinization of every single detail of the teaching process is highlighted. It is also analogous to putting the teacher under a microscope with the idea that all aspects of the teaching process are brought into perspective for the observers to provide constructive feedback (Rao & Lakshmi, 2009). Another metaphor is the “slice of a cake”. This metaphor implies that with microteaching, we only present one segment of the whole teaching process; however we try to illustrate the overall qualities and characteristics as they are reflected in that piece.

Activity 2

Can you think of any other metaphors about microteaching? Discuss it in groups or pairs. Please also state the rationale behind it.

The Participants of Microteaching Process

The Student Teacher

The main goal of the microteaching process is for the student teacher to present in a protected environment where he/she can get feedback from various resources in a non-threatening way (including him/herself as a part of the reflective process after watching his/her own performance). Previous research on microteaching reveals that the students find it useful (Amobi, 2005; Benton-Kupper, 2001; Metcalf, 1993; Mills, 1991). The student teacher prepares him/herself for the microteaching by collecting information about the topic and rehearsing some skills. The key aspect of the preparation period is preparing a lesson plan. Without it, reaching the goals of the microteaching session would be far-fetched. The student teacher also prepares the reflection paper at the end of the session following the instructor’s and peers’ feedback.

Other Students

The other students in the class will act as the students of the lesson. They might need to pretend that they are in a different proficiency level or from a different cultural or linguistic background. The student teacher should specify the background characteristics of the class in his/her lesson plan and other students should act accordingly. As the students know that they will eventually be in the shoes of the student teacher as well, most of the microteaching sessions reported in research yielded positive environments. One key role of the other students will be the providence of the feedback at the end of the microteaching. The students should be encouraged to give feedback (both positive and negative) and can be given a rubric to assess the performance of the student teacher accurately. The rubric can be prepared prior to teaching with a discussion involving the students or a rubric can be adopted into the setting. A sample rubric taken from The Evergreen State College’s Student Teaching Rubric can be seen in Appendix A.

The Supervisor Teacher

The supervisor teacher is usually the instructor or coordinator of the course where the student teacher is practicing. S/he sits at the back of the classroom and observes the session. Generally, the instructor does not interrupt the microteaching lesson but takes notes on both

problematic and positive parts and then provides feedback at the end of the lesson. Here, the attitude of the instructor is vital in the effectiveness of the microteaching. He/she should first highlight the positive aspects of the performance and then list the problematic components by giving evidence and proposing solutions.

Activity 3 List the specific roles of the each participant below.			
Participant	Before microteaching	During microteaching	After microteaching
The student teacher	1- 2- 3-	1- 2- 3-	1- 2- 3-
Peers	1- 2- 3-	1- 2- 3-	1- 2- 3-
The supervisor	1- 2- 3-	1- 2- 3-	1- 2- 3-

Steps of Microteaching

Step 1: Orientation about Microteaching

In this step, the students are given background information about microteaching. Related theoretical background together with advantages and disadvantages of using microteaching sessions are discussed. At the end of the session, the students should understand the major differences between microteaching and making a presentation.

Step 2: Providing Theoretical Information about the Skill or Topic

In the second step, information about the skill, technique or topic that will be practiced should be introduced. In this theoretical session, the students can read about what they need to know prior to teaching their topic or skill. For example, if the microteaching session will be a practice of “Teaching Speaking”, the students should study on different aspects of teaching speaking such as theories, techniques and activities of teaching speaking.

Step 3: Providing a Model Microteaching

If the students have not conducted a microteaching session before, it would be practical to observe a microteaching session. If there is no time limitation, good and bad examples of microteaching sessions can be introduced and discussed in class.

Step 4: Preparing a Microteaching Lesson Plan

One of the key elements of microteaching is the lesson plan. The student teacher should know how to prepare a lesson plan and also should scale down the steps of the lesson plan in

order to meet the time requirements. A lesson plan template can be provided to assist the students.

Step 5: The Microteaching Session

In this video-taped session, the student teacher teaches the skill, technique or topic to her peers. The supervisor should monitor the process but should not interfere until the end of the session. The time restrictions should be followed carefully. If necessary, one of the students can be given the role of the time-keeper and inform the student teacher about the time. The Microteaching Evaluation Rubric should be distributed to the class prior to the session.

Step 6: The Feedback Session by the Peers and Supervisor

Immediately after the performance, 5-10 minutes should be allocated to the feedback session. First, the peers should be invited to give feedback. The students should be reminded about the caveats regarding giving feedback. After the student feedback session, the supervisor should wrap up the session by highlighting both positive and negative aspects. This step is video-taped as well.

Step 7: Reflection by the Student Teacher

The final step of the microteaching session is the reflection paper prepared by the student teacher. If necessary, a sample reflection paper can be introduced. In the reflection paper, the student teacher should briefly describe what she did, why she did it and if she did it well or not. She should also address the important suggestions and/or feedback from the peers and instructor. She should also address the important suggestions and/or feedback from the previous feedback session. A sample reflection paper is provided in the Appendix B.

Figure 1. The Microteaching cycle.

Feedback in Microteaching

One of the strengths of the microteaching technique is the multi-channelled feedback. The student teacher gets feedback from her peers and her supervisor immediately after the session and can also reflect upon her practice after watching her performance and feedback from others. While providing feedback, as Maheshwari and Vishnoi (2011) assert, the following caveats should be kept in mind:

Be respectful, do not judge the student teacher, be polite and consider the social ties with in the class.

Start on a positive note, highlight the positive aspects first. If you start off with negative criticism, the person receiving the feedback might not even hear the positive part, which will come later.

Be descriptive and specific, rather than evaluative, clearly point out the problematic aspects. Do not say: “I did not like your overall performance” or “Your pronunciation in

general was really bad.” You can say: “You did not use the blackboard efficiently” or “You mispronounced architecture”.

Don't be repetitive, do not repeat what other people said in a negative or positive tone.

Avoid conclusions about motives or feelings. For example: rather than saying: “You don't seem very enthusiastic about the lesson”, you can say “Varying your rate and volume of speaking would give you a more animated style”.

Activity 4

What other suggestions can be given while giving feedback? Discuss it with your partner(s).

Video Recording in Microteaching

Videorecording the microteaching is an important component of the process. In some places where the technological tools are available, Microteaching Labs are used to facilitate the process. However, it is not a must. A good camcorder can be used to have a similar effect. If it is possible, a technician from the school, if not one or two students can be responsible for the recording process. The presence of the camera in the classroom might make students feel uneasy or look artificial. This is one of the major drawbacks of the microteaching session.

PRACTICAL TIPS

The following tips can be considered during the microteaching process.

- Provide a rubric for assessment if possible
- Present a video-taped microteaching session during the orientation
- Provide a sample reflection paper
- Be careful about time restrictions
- Be positive while giving feedback
- Address both effective and ineffective aspects of the performance while giving feedback
- Video-tape the whole process
- Guide the students about the feedback process

ADVANTAGES OF MICROTEACHING

Sharma (as cited in Rao & Lakshmi, 2009) summarized the advantages of microteaching as follows:

- Modification of teaching behavior
- Knowledge of teaching skills
- Developing teaching skills
- Improving teaching practice
- Individual training
- Regulating teaching practice

- Real teaching
- Reducing complexities
- Focus on teaching
- Analysing one's own teaching behavior
- Continuous reinforcement
- Research tool

CONCLUSION

The use of microteaching is a commonly used training technique worldwide. It is used in many areas such as science education, medicine as well language teaching. If properly planned and administered, it can be a very effective tool to help student teachers' transition from theory into practice. The simplification of the complexities of regular teaching process might be conducted in different components of the teaching process such as class size, time, task and content (He & Yan, 2011). With the multi-channeled feedback module, it is an effective tool of teacher development. Different adaptations of the microteaching process make it feasible in different contexts throughout the world.

APPENDIX A: ASSESSMENT TOOL FOR MICROTEACHING

Presenter's name: _____ Observed by: _____

Source of Evidence: Microteaching Observation

1. The teacher candidate aligns instruction with the plan and communicates accurate content knowledge

Teaching Elements	Criteria	Rating			
		Not present	Developing	Proficient	Accomplished
A. Alignment	Classroom instruction is aligned with the instructional plan.				
B. Meaningful Opportunities to Learn	Students are learning the key skills - concepts needed to reach the learning targets.				
C. Accuracy	The teacher candidate demonstrates accurate knowledge of the content.				
D. Interdisciplinary Instruction	Students are engaged in tasks that provide interdisciplinary connections with other subject areas.				

2. Students participate in a learning community that supports student learning and well-being

A. Respect	Classroom interactions between teacher - students reflect respect for students.				
------------	---	--	--	--	--

3. Students engage in learning activities that are based on research and principles of effective practice

A. Questioning and Discussion Techniques	Teacher answers and poses questions in a way that engages students in cooperative discussions that enhance learning, critical thinking, transformative multicultural thinking, and problem solving.				
B. Delivery and Pacing	Students engage in learning activities that are: paced appropriately for all students, culturally responsive, and				

	allow for reflection & closure.				
C. Active Learning	Students are cognitively engaged in the learning activities.				

4. Students experience effective classroom management and discipline

A. Transitions	Teacher helps students move between learning tasks or lesson segments in an efficient manner.				
----------------	---	--	--	--	--

5. The teacher candidate and students engage in activities that assess student learning

A. Alignment	Students engage in assessment activities aligned with learning targets.				
B. Multiple Modes and Approaches	Students engage in various assessments that measure their performance relative to the learning targets.				

APPENDIX B: REFLECTION PAPER

The type of the activity is role-play called “Ordering Food At The Restaurant”. In this speaking activity, students make a dialogue with his/her friends based on his/her roles, which are the waitress/waiter or the customer. This communicative speaking activity is planned to make the students to use some specific structures, such as ‘I would like to have...’ or ‘Can I...’. The other aim of the activity is to provide the students with specific lexical items, such as ‘steak, waffle, doughnuts’.

The activity is also designed to improve students’ speaking fluency and self-confidence while speaking. In order to achieve this objectives, firstly, I planned to motivate my students. Since their age is fourteen to fifteen, I thought preparing some attractive materials changes the classroom atmosphere in a positive way. These materials, such as knife, spoon, bread, chicken drumsticks, give the student the chance to carry, touch the objects and pretend eating the food, which makes the task a practical and hands-on activity. These materials are the basic motivation factors in the task, which work well in my opinion.

The preparation and the presentation part are devoted to the revision part so that the student will have a clear idea about what to say and how to say. Moreover, by following the steps written on the role cards that I distributed before the task, students know what is expected to do from them, instead of what is expected to say. This gives a choice to students on their own speech.

Of 15 minutes, first 5 minutes are devoted to the revision part and organizing the students for the activity. After that students perform their roles in front of the class. Therefore, when we take the ratio of teacher talk and the students talk into account, we can see that students talk more. In this lesson, teacher is an organizer, a model, a facilitator but not a participant.

As a teacher, I also did my best to give corrective feedback to my students during the performance and while they are preparing their dialogues. Most of the feedback is an immediate one. Some of the pronunciation errors and communication breakdowns are handled in a smooth way. Furthermore, I tried to draw my students’ attention not to use their mother tongue during the task.

Finally, apart from being too fast while revising the previous topics and giving instructions because of the limited time, I think that I did my best to make student motivate to

talk. As a result, most of the students would love to come to the board and show their performance by using the object that I prepared as educational materials. Also, I think that I should be more careful while giving instructions. I should explain the task and the materials before distributing the cards. Consequently, I think I was amply rewarded by my students because what I want to do is to make my students to talk in a positive and enjoyable atmosphere.

Chapter 59

TEACHING SPEAKING IN EFL CLASSES

Çağlayan Erdönmez

Kocaeli University,
School of Foreign Languages, Izmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. list different types of conversational rules and structures
2. list important conversational strategies
3. list important aspects of a good speaking activity
4. list different types of practical activities that can be used in a speaking class.

STUDY QUESTIONS

1. What are the differences between spontaneous and prepared talk?
2. What are some of the factors to consider in determining the effectiveness of speaking activities?
3. What are some teacher roles in speaking classes?

INTRODUCTION

What language skill comes into your mind first when you are asked to define the term fluency in a foreign language? "...people who know a language are referred to as 'speakers' of that language, as if speaking included all other kinds of knowing" (Ur, 1996, p. 120). Speaking seems to be intuitively regarded as the most important skill of all the four language skills. In fact, many language learners consider speaking as equal to the overall language competence, and they measure their language proficiency, their accomplishments and their

progress through learning based on their speaking skills. Fluency is then strongly associated with and measured by the ability to converse with others, much more than the ability to read, comprehend oral language or express oneself on a written document. In many contexts, people judge a language user 'at face value' upon speaking skill. In other words, people form judgments about our language competence from our speaking skills rather than any other skill (McDonough, 1996).

Speaking can be defined as “the process of building and sharing meaning through the use of verbal and non-verbal symbols, in a variety of contexts” (Chaney, 1998, p. 13). Speaking plays a crucial role in foreign language learning and teaching. With the internalization of English as the medium of communication, the need for meaningful and successful interactions has become more imperative than ever. Students should not only form grammatically correct sentences, but also use these sentences in appropriate social contexts taking into account the cultural background and social status of the interlocutor (the person(s) they are talking to).

Characteristics of Spoken Language

It is useful for language teachers in the classroom to consider and analyze how native speakers participate in oral interactions and what they actually do when they are engaged in conversations. Towards this end, language learners and teachers need to recognize that speaking consists of three main areas of knowledge:

1. *Mechanics*

Mechanics of a language involves pronunciation, grammar, and vocabulary. This basically means expressing oneself with the right words in the right order with the correct pronunciation.

- **Lexis and Grammar:** The nature of speech involves the use of common lexical phrases. It is highly like to use certain lexical phrases for a variety of language functions. Therefore, teachers should plan and prepare language activities in such a way that students can have plenty of opportunities to engage in communicative activities which involve certain language functions such as agreeing or disagreeing, expressing surprise, apologizing, inviting, and offering etc. It is really essential that teachers provide students with certain lexical phrases, fixed expressions and conventional routines that learners can use within certain conversational contexts (job interview, buying clothes, etc.) for a variety of purposes and functions (convincing, agreeing, etc.).
- **Expressive devices:** During conversational interactions native speakers of English resort to physical and non-verbal (paralinguistic) means in order express different emotions through the use of varying stress and pitch patterns for certain parts of their utterances. These suprasegmental features and devices are especially important in face-to-face interactions where speakers need express different emotions, change the intensity of their emotions and express extra emotions. Therefore, classroom activities should be designed to provide students with at least some of the major expressive devices to help them become effective communicators.

- **Connected Speech:** Speaking does not necessarily involve bringing together speech sounds and form words and then sentences. Speech involves a continuous stream of sounds and it is not always easy to find clear-cut borderlines between sounds and words. Effective speakers of English do not just produce individual phonemes of English but they are also able to use connected speech. In connected speech, speech sounds go through some modifications and changes such as omission, assimilation, adding or weakening of some sounds. Therefore, activities in the classroom should be designed in such a way that they help students to get acquainted with the features of connected speech, and improve their fluent, connected speech.

2. Functions

This includes transactional and interactional language use. It is basically the knowledge of using language for a variety of purposes. Language users need to know when the message needs to be clear and precise (transaction/information exchange) or when precise and exact understanding is not really essential (interaction/relationship building).

Nunan (1998) points out that listening texts and tasks can be categorized according to functional terms. For instance, news report carries out a different function from transactional encounters, and the type of language used changes accordingly. Our analyses of texts can benefit from similar considerations from the perspective of the producer rather than the receiver. Bygate (1987) describes oral interactions in terms of routines. These routines are conventional ways of presenting information and they can focus either on information or interaction. Information routines can either be expository (e.g., narration, description, instruction, comparison) or evaluative (e.g., explanation, justification, prediction, decision). Information routines frequently involve recurring types of information structures. Interaction routines on the other hand can be either service (e.g., job interview) or social (e.g., dinner party). This distinction between information and interaction routines reflects the distinction between transactional or interactional functions of language. The speaking grid by Nunan (1998) in Table 1 can be used as a planning device to design a syllabus for speaking and oral interaction.

Table 1. A planning grid for speaking and oral interaction by Nunan (1998)

		Information/Transaction		Negotiation of meaning Management of interaction
		Expository	Evaluative	
		narrate describe instruct compare	explain justify predict decide	
Interaction				
SERVICE	Job interview Booking a restaurant Buying stamps Enrolling in school etc.			
SOCIAL	Dinner party Coffee break Theatre queue etc.			

Negotiation of Language: Negotiation of language is mainly used for two purposes; to ask for clarification of meaning and to give information about the structure of language we use.

Teachers should design some activities that can help students master some clarification strategies and some fixed phrases that can help clarify what the other person is saying. The best way to teach clarification is to offer students some expression that can be used to ask the other person clarify any part of his/her speech that sounds obscure. A helpful way to offer such activities is to write some phrases, explanations and topics to be explained on cards. Some phrases and explanations on the cards can be left a bit obscure and incomprehensible so those students feel the need to make clarifications. Some example phrases that can be given to student:

- I'm sorry. I didn't catch that.
- I'm sorry. I don't understand.
- What exactly does X mean?
- Could you explain that again, please?

Second reason why we use the negotiation of language is to give information about the structure of our language. Structuring the discourse of our language is especially helpful when we want to make more written-like speeches. If you are giving a presentation to a group of people, you have to structure your thoughts and use some initiation phrases to highlight important parts of your speech and help your audience follow the sequence of your speech. This is also helpful in signaling the cause and effect relations between your arguments.

Some useful expressions or phrases that can help students to structure their discourse:

- The important thing to grasp is that...
- To begin with/And finally...
- What I am trying to say is that...
- What I mean is...
- The point I am trying to make is that...
- ... or, to to put it another way...

3. Social and Cultural Rules and Norms

This basically involves conversational rules and structure (turn-taking, rate of speech, relative roles of participants, etc.), and conversational strategies (paraphrasing, asking for clarification, use of filler, etc.). It is essential for learners to understand how to take into account who they are speaking to, under what circumstances, about what, and for what purpose and reason.

Spontaneous Communication

One of the biggest challenges language teachers face in speaking classes is to prepare appropriate communicative activities in systematic ways. More often than not, teachers draw on their intuition-based random selection of communicative activities. This often results in

failure to find effective ways to prepare students for spontaneous communication. Although there are detailed guidelines to bring real-life like communicative situations into the classroom thanks to communicative teaching methodology, the type of communicative skills and language input is not really specified. Dörnyei and Thurrell (1994) points out that although many people think informal everyday conversation is unstructured and random, all conversations are governed by certain rules. These rules determine who speaks when, and for how long. They also state that natural conversation involves fixed expressions or conversational routines. They classify these rules and routines into six categories in order to design the content of a conversation course.

Conversational Rules and Structure

Conversational rules and structure are related to the organization of a conversation, causes for possible interruptions and simultaneous talk:

1. *Openings*: There are various ways to initiate a conversation. They might come in the form of greetings and introductions (e.g., How are you? / Fine thanks. And you?), questions (Excuse me, do you know...) comments (That's a nice necklace...), general complaints (Public transportation in this city is really efficient...), and social lines (A great dinner, isn't it?). It is important to note that students can easily turn a very formal or a factual communication exchange (buying clothes in a shop) into an informal conversation using the above mentioned openings.
2. *Turn-taking*: There are underlying rules in the language determining who, talks, when and for how long. The language classroom does not give students enough chance to raise their awareness of turn-taking rules. This is especially disadvantageous for students coming from different cultural backgrounds. By using authentic video recordings and sample native talks, turn-taking ability can be developed through a systematic and conscious planning.
3. *Interrupting*: Interrupting is an important issue in turn-taking. Language user should know when, how, and how much to interrupt. Otherwise they might look rude. Therefore, students should be familiar with phrases like (e.g., *Sorry to interrupt, but... or Sorry, but did I hear you say...?*).
4. *Topic Shift*: Sometimes when we need to end a topic and start to talk about a new one, using certain conversational routines can be very helpful to make a smooth transition (e.g., *Oh, by the way... or That reminds me of...*). Or we might want to return to an earlier topic (e.g., *Going back to..., As I was saying..., or Yes, well, anyway...*).
5. *Adjacency Pairs*: Some utterances (e.g., questions, invitations, requests, apologies, compliments, etc.) ask for a certain immediate response or reaction from the interlocutor (the person on is talking to). The utterance and the immediate reaction or the response is called adjacency pairs.
6. *Closings*: People usually use a specific sequence of pre-closing and closing steps to set the basis to end a conversation (e.g., *It's been nice talking to you..., Well, I don't want to keep you from your work..., We must get together sometimes...*). Closing signals can easily be misleading in a foreign language; therefore it is really beneficial

to explicitly teach students a set of closing routines so that they can be prepared for the kinds of phrases they might encounter in a spontaneous conversation.

As we can see the above mentioned categorization of conversational rules and structure come in handy when we want to prepare language learners for real-life like situations. Taking these into consideration can set the ground for a planned, systematic lesson planning to teaching conversational skills. Activities geared towards awareness raising for fixed structures/responses and formulaic expressions can help learners increase their communicative competence.

Dörnyei and Thurrell (1994) also state that other than conversational rules and structure, conversational strategies also play an important role in spontaneous conversation where learners have to deal with communication troubles such as inability to understand a word, or misunderstanding the other person. Getting familiar with and learning conversational strategies can assist learners gain a sense of security and room for maneuver.

The most important conversational strategies proposed by Dörnyei and Thurrell (1994) are as follows:

1. *Message Adjustment or avoidance*: Depending on your language competence, saying what you are capable of saying rather than what you want to say or not saying it at all.
2. *Paraphrase*: Using a set of words to describe or exemplify an object or an action whose name you don't really know or remember. Some useful expressions are structures like *something you can... with, a kind of ..., etc.*
3. *Approximation*: Expressing what you want to convey in such a way, using different terms, that you mean as close as possible to your original message. Using 'all-purpose words' such as stuff, thing, what-do-you-call-it can be very helpful.
4. Asking for help: What's the word for...? Or What do you call...?
5. Asking for repetition: Pardon? or Sorry, what was the last word?
6. Asking for clarification: What do you mean? What are you saying/trying to say?
7. Interpretive summary: You mean?, If I've understood correctly... or So are you saying that...?
8. Checking: OK?, Is that clear? Or Are with me? Are you listening? Did you hear what I said? Or over the phone, Are you (still) there?
9. Use of fillers/hesitation devices: Well, Now let me see, or The thing is, etc.

What Does Teaching Speaking Involve for Language Teachers?

Language teachers should help their students develop areas of knowledge (Mechanics/Functions/Social and cultural rules and norms) given above. They should provide their students with ample opportunities for authentic practice. It should be kept in mind that ultimate aim of these activities should be to prepare students for real-life situations. Language teachers should also encourage their students to develop the ability to produce:

- grammatically correct (mechanics)
- logically connected sentences that are appropriate to specific contexts (Functions/Social and cultural rules and norms)
- and to use comprehensible pronunciation.

Now many linguistics and ESL teachers agree on that students learn to speak in the second language by "interacting". For interaction, communicative language teaching and collaborative plays a crucial role in that they foster information and interaction exchanges between and among learners. Communicative language teaching is designed based on the characteristics of real-life situations and they require communication. By using this method in speaking classes, students will be provided with enough opportunity to communicate with each other in the target language. Therefore, teachers should create a classroom environment where students have real-life communication, authentic activities, and meaningful tasks that promote oral language. This can happen when students collaborate in groups to achieve a goal or to complete a task. (Kayi, 2006)

Characteristics of a Successful Speaking Activity

Whatever the nature or the goal of the speaking activity is, a good, learner-centered speaking activity should involve the following qualifications:

A speaking activity where:

- learners talk a lot
- participation is equal and even
- motivation is high
- language is of an appropriate level

Problems with Speaking Activities

By its nature, speaking can be problematic and therefore difficult for language teachers. No matter how organized or involving the speaking activity is, some problems just arise on account of students. Some of the common problem that might arise during a speaking activity and some possible strategies to help solve these problems are listed below:

- *Inhibition*: Sometimes students' personalities come into play and they might feel reserved to participate in any activity.
- *Nothing to say*: Sometimes it is hard for students to comment on a topic or find ideas to put forward.
- *Low or uneven participation*: This mostly happens in crowded classes where some certain students dominate the discussions.
- *Mother-tongue use*: Particularly low-level students tend to use their mother tongue especially during group work activities where they need to talk with their peers.

What the Teacher Can Do to Help to Solve Some of the Problems?

Speaking activities should involve each and every student in the classroom through the use of group work. This also helps remove some of the responsibilities of a student gets reserved or inhibited students to talk as well. Teachers should base activities on easy language so that students feel no need to use their mother tongue. Appropriate and interesting task choice is essential for student participation. Unfamiliar topics might leave student with no idea to talk about. As a summary, the following points should be kept in mind during designing a speaking activity:

- use group work
- base the activity on easy language
- make a careful choice of topic and task to stimulate interest
- give some instruction or training in discussion skills
- keep students speaking the target language

PRACTICAL TIPS

What Makes A Good Speaking Activity?

Thanyalak Oradee suggests that speaking is the most important and essential skill (Oradee, 2012). Thus, before preparing any speaking activity, there are important points to consider in detail. The following table provides a good overview of these points.

Table 2. What make a good speaking activity

Repeatable	Can it happen only once, or will it be interesting to do the task multiple times with slight changes (e.g., new groupings, new “topic”, etc.). Repetition allows for rehearsal, refinement, confidence building, and teacher input/repair.
Structured	Is there some procedure that should be followed, some process to go through? Adults can accept speaking as an aim in and of itself, teens and kids feel better “doing something”. A structure helps support the learners by giving them aims, let’s them know what they should try to do/achieve, etc.
Open-Ended	This isn’t just the opposite of the above! Is there enough room in the task for the learners’ personality, creativity, and sense of humor – or are there only limited and “correct/incorrect” choices given them? On the other hand, does it depend on the students having creativity?
Has A Task Goal	(not a “teacher’s goal”) Related to the above item. Some “end point” also lets students know when they are done, gives them a reason to work through the task to completion.
Competitive	Is there some way to evaluate or rank the products of the task? With teens and kids competition can add motivation (and some adult groups like it too).
Reportable	Is there something to tell/show once the task is done? Can we rank individuals/groups? Will the audience have a reason to listen to the “reports” of other groups, or will they all have essentially the same thing to show/tell?
Challenging	Are the learners doing something that “pushes” them, and allows them to work at their level of ability? Is the task structured to allow for different levels of challenge/ability?
Has A Teaching/Learning Goal	Not every free speaking task needs a tight link to “newly learned language”, but can learners see a connection between the speaking task and other recent work in the course – do they feel that they are “practising” something? The goal might also be diagnostic/evaluative.

Source: Thomas Topham (prepared for tefl.net).

Awareness Raising Activities

As they lack certain skills, there are things that learners can't easily do, such as retrieving words at speed or achieving long, pause-free runs. Yet, there are also things that learners don't know such as what to say in order to signal a change of topic or how to respond appropriately to a difficult request. This results in inhibited fluency. Activities that help students uncover gaps are called awareness activities. It is assumed that the instructor will always be available to guide the event and provide support & feedback where and when necessary. Awareness concept is rooted in the cognitivist learning theory arguing that, to some extent, conscious awareness is needed in the sense of a prerequisite to restructure learner's mental representation of the language. Thornbury states that three processes are involved in this concept: attention, noticing and understanding (Thornbury, 2005). A teacher or several learners can support or contribute to these processes. To give an instance, a teacher may secure attention by sharing a humorous or strange story or a tale. Learners together form a story depending on a picture and share and convey their creation to others in the groups. This leads to attention, then to noticing and finally to understanding.

Sample Activity / Picture Dictation

This is a low preparation fun activity that works well with large classes, especially with young learners and teens. All your students' need is a blank piece of paper and what teacher needs is a little bit of imagination.

Procedure

- First of all explain to the students that they are going to do a picture dictation, that you are going to describe a picture to them and that all they have to do is simply listen and draw what they hear you describe.
- You then describe a simple and easy-to-draw picture to them and they draw it. To help you with your first picture dictation you can use the picture on the accompanying worksheet and the description below it as a guide. It is a very simple picture for a low-level beginner's class but this kind of activity can be adapted to any level of student. Simply change the content of the picture accordingly.
- When you are describing the picture it is best to describe one object at a time slowly and to repeat each description two or three times.
- Make sure you give students enough time to finish drawing one object before you move onto the next object and it is a good idea to walk around and look at the students' drawings as they are drawing them so that you can see how well they are understanding your descriptions and then you can adjust them accordingly and give them any support they need.

Tips for Making the Activity Work Well

- Before starting the activity you may want to draw a square or rectangle to represent a piece of paper on the board and elicit vocabulary from the students that they will need to know for the activity, such as in the middle of the piece of paper, in the top/bottom/right-/left-hand corner of the piece of paper, in front of, behind, on top of etc.
- For lower levels, you may even want to draw pictures of the things, the house, the hill, clouds, birds and children skipping etc. that will appear in the picture on the board before starting the activity to review vocabulary. How much pre-teaching of vocabulary and language you do will depend on the level of your students.

Variations

- Get students to colour the pictures in afterwards like a colour dictation, for example, colour the roof of the house green, colour the door of the house red, or get students to label different objects by writing the name of the object underneath it, such as house, bird etc.
- You can also get students to write a description of the picture afterwards.
- Another good variation is to give students a list of objects and get them to draw their own pictures with all those objects in them.
- The students then work in pairs. One student describes their picture to their partner and their partner draws what they hear.
- They then swap roles and afterwards they compare the pictures they drew with their original drawings pointing out the differences and usually having a giggle.
- Source: Fiona Lawtie, Teacher, Freelance materials writer

Using Recordings and Transcripts

Inside the classroom, speaking and listening are the most often used skills (Brown, 1994). Exposure to instances of spoken language is one of several ways to raise awareness of aspects of spoken language in learners and to get them to study such instances works as well. Up to now, it has been in the form of recordings including monologues and multi-person interactions. These tools are pre-scripted. The problem with recordings is that they are superficially reflecting the real spoken language due to the lack in pause fillers, repair, back-tracking, and lack in features such as interaction and turn-taking. Regarding this, R.A. Hall (1968) tells us that language is “the institution whereby humans communicate and interact with each other by means of habitually used oral-auditory arbitrary symbols”. One drawback of recordings is that they are often prepared to contain a pre-selected grammar structure and they are made simple to make sure that they are intelligible. On the other hand, one advantage of them is that instructors can insert examples of particular features that learners need to be aware of. Again, one other problem with recordings is that they are mostly native speakers who speak in them. That may sound unnatural and far from reality. Many non-native learners

may need an easier way of getting hold to English-speaking context. Besides, some contexts such as soap operas and films can be far away from intelligibility. Putting recorded data into effective practical use may require a number of factors such as; activation of background knowledge, checking gist, register, details, listening & reading, resolution of doubts and focusing on language features.

Focusing on Selected Language Features

Focusing on organization is about making learners sensitive to the aspects of spoken genres. These genres such as business presentations or press conferences may be little bit unfamiliar to learners. Language functions (or patterns) that tend to occur in certain discourse situations (e.g., declining an invitation or requesting time off from work), can be identified and charted (Burns & Joyce, 1997). Apart from this, focusing on sociocultural rules, topic shift, performance effects, communication strategies, speech acts, discourse markers, features of spoken grammar, vocabulary, lexical chunks, stress and intonation are what learners may need to touch upon to hold a better grip of a rather more effective speaking skill.

Using Live Listening

Compared to recordings, live listening bears a notable advantage of interactivity with a guest speaker or a teacher. Learners can direct questions to the speakers, can ask them for repetitions and clarifications.

Using Noticing-The-Gap Activities

These kind of activities aim to display the difference between the current level and the target competence of the language learner. A task-based instruction would best work with this activity making learners perform a speaking task, observe what a skilled person can do, and re-perform the initial task to display the difference between the initial stage and the final one.

Appropriation: Practised Control

While controlled practice involves repetition of language items with minimal mistakes, practiced control displays a progressive control of skill and, at the same time, involves mistakes that may be present all over the process, yet with a constant teacher support available all the time. Because, speech has its own skills, structures, and conventions different from written language (Burns & Joyce, 1997; Carter & McCarthy, 1995; Cohen, 1996). That means that especially a low-level learner/speaker of a language would benefit from being monitored by a skilled user of the same target language.

Drilling and Chants

Learners need to practice to get the control of speaking skill in the target language. According to Bashir, Azeem & Dogar (2011), learning to speak demands a lot of practice and attention. We learn to speak our mother tongue just by listening and repeating. Thus, imitating and repeating the structures such as words, phrases and sentences, that's, drilling is what is required to gain the management of speaking, even by trial-error process. Apart from enabling articulatory control for a speaker, drilling also moves fresh items from working memory to long-term memory. All these benefits result in fluency in the long run. Chants involve the practice of repeating and chunking more commonly than drilling does.

Writing Tasks

R.H. Robins (1979) does not give a formal definition of language but points out certain facts related to language, saying that "languages are symbol systems, almost wholly based on pure or arbitrary conventions". However strange it seems, writing has a role in the initial stages of several works aiming at speaking. These writing tasks include dictation, paper conversations, computer-mediated chat and rewriting.

Reading Aloud

Just as strange as writing feels, reading aloud is a useful tool to support any objective directed at spoken language. It is a transition between writing and speaking.

Assisted Performance and Scaffolding

Competent practitioners, according to Socio-cultural theory, make L2 learning easier and more accessible for less skilled ones through scaffolding and several other interventions.

Dialogues

Essentially, any language use is dialogic in its nature. Dialogues provide transition from a teacher-based classroom to an interaction-based/focused setting. To incorporate new language items and to provide an easy access to/for memory, a several number of tips are on hand such as items on board, chunks on cards, memorization script, picture and word cues, flow-diagram conversations, conversational tennis, disappearing dialogue and dialogue building. According to N. Chomsky (1957) a language is "a set of sentences, each finite in length and constructed out of a finite set of elements".

Communicative Tasks

As speaking is a cognitive skill, it is basically automated through practicing successively. Therefore, when tasks are communicative, they help to accomplish two crucial learning needs: preparing learners for authentic context use and automatization of their knowledge. Enhancing communicative competence and performance is realized inside and outside of the classroom setting. Conversational fluency in a new language develops inside and outside the classroom, and students can attain it in one to three years (Collier & Thomas, 1989). Jigsaw activities, info-gap race, surveys, blocking games and guessing games are among the frequently used activity types to prepare a communicative learning-teaching interaction.

Task Repetition

By adjusting elements of planning, interactivity, results, outputs and task repetition, teacher can influence the outcome of tasks. To teachers, task repetition may bear several advantages, yet, to learners, it may feel demotivating without a strong motive and incentive. To handle this shortcoming, here are some suggestive mini-activities: the onion, poster carousel, headlines.

SAMPLE ACTIVITIES

Discussion Activities

Activity 1

Good Manners

This activity is all about manners and etiquette. This can be an interesting topic to discuss with your students, especially if there are cultural differences regarding norms of behavior between the country you're working in and the UK.

Preparation

Write up two columns with headings on the board:

Good Manners	Bad Manners

Procedure

- This is a simple introductory activity to get across the idea of manners, both good and bad.
- Draw the table on the board and give students a few ideas to get them going.
- Then they should fill their table with as many examples of good and bad manners as they can think of.

- Ask students to read the statements about manners. There are three that are FALSE. See if they can find them. (The three false ones are: 3, 4 and 6.)

In the UK...

1. ... do stand in a queue when you wait for a bus or to pay for something in a shop.
2. ... don't spit on the street.
3. ... do burp loudly after a meal.
4. ... don't apologise if you bump into somebody on the street.
5. ... do say 'please' and 'thank you' at every opportunity.
6. ... don't cover your mouth when you yawn or sneeze.
7. ... don't greet people with two kisses.
8. ... don't pick your nose in public.

Once the students have finished, ask them to decide on a list of do's and don'ts for good manners in their country.

Source: Jo Budden, British Council, Spain.

Activity 2

Discussing Languages

This is a discussion activity that you can use to find out about your students' opinions of language learning and how important they think it is. It gets your students talking and sharing opinions but also gives you a chance to listen in and to understand their motivation and attitudes towards languages.

Preparation

Make a copy of the discussion statements and cut them into strips so those students can take one statement at a time and discuss it. Add some statements of your own if your students have specific language issues they may want to discuss.

Procedure

- Put your students into groups of four or five and give each group a statement.-
- Let them discuss the statement for a few minutes while you monitor and feed in any language they need.
- Then rotate the statements around the groups.
- Once all the students have discussed all the statements you might want to have a class vote to see what the consensus of opinion is on these statements and share some of your own opinions and insights.

Discussion Statements

Everybody should speak at least two languages.
In the future there won't be so many different languages in the world.
Tourists in my country should make an effort to speak my language.
Life would be easier if all countries spoke the same language.
I think learning languages is really important these days.
Girls are normally better at learning foreign languages than boys!
If languages disappear, different ways of thinking also disappear.
I would like to know more foreign languages.
Some languages are more important than others.
English is an 'international language'.
Knowing foreign languages helps you to get a good job.

Source: Jo Budden, British Council, Spain.

Problem Solving/Task-Based Activities

Activity 3

Change Place, Change Face

This activity gives students maximum speaking time and helps develop fluency. The slightly 'unusual' classroom set-up seems to encourage students to speak, producing a healthy buzz and fostering a positive learning environment. I've found it can be a good option for classes with shy students, or groups who have become bored with traditional pair-work activities. Requiring only minimum preparation and just a little moving around of furniture, this activity can be used with learners at all levels.

Preparation

You will need a list of 8-10 questions which encourage your students to speak about themselves/give their own opinions, and which could be discussed for a few minutes each. You should also think about how to arrange your classroom so that students are sitting in rows lined up to face another row, with enough room for them to get up and change places.

Procedure

- I arrange the classroom so that chairs are lined up in a row with another row directly facing them. Space permitting, I put all the desks to one side, though this isn't essential. Large classes can be set up with several sets of rows.
- I ask students to find a seat. For an odd number of students, I add an extra chair at the end of one row, making a 'threesome'.
- I explain to students that they will have a chance to speak with different students and to develop their fluency. They will discuss the question on the board for several minutes until I say 'change'. They will then get a new question and also change

partners. To change, students in one row stay in the same place, whilst those in the opposite row move along one space every time.

- I write the first question on the board, reading it aloud if not all students can see it, and ask them to start speaking. Soon everybody is engrossed in conversation, finding ways to communicate with their partner, despite all the surrounding noise.
- After two/three minutes, I tap on the board and ask students to ‘change’. Students on one row each move down a seat, with the person in the last position moving back up to the top of that row.
- Students ‘greet’ their new partner as I board the next question, and then start speaking again.
- In my experience students are happy to keep talking, and it is up to the teacher how much speaking practice s/he feels the students need and how many questions to give. Twenty minutes is usually appropriate.
- Whilst they are speaking I listen to/observe individual learners from the back of the room. I don’t get involved in the conversations; however, if I see that students don’t have much to say for any particular question, I move onto the next one, though this rarely seems necessary.
- At the end, I do a short feedback session, for example asking students which question they most enjoyed discussing. Feedback could also focus on error correction, an opportunity to pick up on problems common to several learners.
- For teachers with access to an OHP, an alternative to boarding each question is to prepare the questions on a transparency to be projected, using a piece of card to ‘unveil’ one question at a time.

Source: Marta Joyce Sabbadini-Essinki, Teacher & Trainer.

Activity 4

Task-Based Speaking

This is a speaking lesson on the theme of planning a night out that uses a listening exercise to provide language input.

Preparation and Materials

You will need to record two people planning a night out on the town.

Pre-Task (15-20min)

Aim: To introduce the topic of nights out and to give the class exposure to language related to it. To highlight words and phrases.

- Show sts pictures of a night out in a restaurant / bar and ask them where they go to have a good night out.
- Brainstorm words/phrases onto the board related to the topic: people / verbs / feelings etc.
- Introduce the listening of two people planning a night out. Write up different alternatives on the board to give them a reason for listening e.g., (a) restaurant / bar (b) meet at the train station / in the square. Play it a few times, first time to select from the alternatives, second time to note down some language.

- Tell them that they are going to plan a class night out and give them a few minutes to think it over.

Task (10min)

Students do the task in twos and plan the night. Match them with another pair to discuss their ideas and any similarities and differences.

Planning (10min)

Each pair rehearses presenting their night out. Teacher walks around, helps them if they need it and notes down any language points to be highlighted later.

Report (15 min)

- Class listen to the plans, their task is to choose one of them. They can ask questions after the presentation.
- Teacher gives feedback on the content and quickly reviews what was suggested. Students vote and choose one of the nights out.

Language Focus (20min)

- Write on the board five good phrases used by the students during the task and five incorrect phrases/sentences from the task without the word that caused the problem. Students discuss the meaning and how to complete the sentences.
- Hand out the tapescript from the listening and ask the students to underline the useful words and phrases.
- Highlight any language you wish to draw attention to e.g., language for making suggestions, collocations etc.
- Students write down any other language they wish to remember.

Note:

You can go on the planned night out with your students. This can make it even more motivating for them.

Source: Richard Frost, British Council, Turkey.

Story Telling Activities**Activity 5****Talking about the Past**

This speaking activity is for a 1-1 class with a learner at an intermediate level and who works, as many of the questions ask for reflection about working life. It could be adapted for use with a group but would need some very close monitoring and support from the teacher. The learning aims of the activity are to review and provide further practice in various ways to talk about the past, including past continuous, two perfect forms, used to and expressing past regret (I wish I hadn't...). This could also be used as a diagnostic for a higher level learner.

Preparation

Before the class, prepare a copy of the questions for yourself and your learner. Remember you can also explain the activity's aims and procedure to the learner at a more detailed level than you would with a group.

Procedure

1. Ask your learner to answer the questions first – this could be done in note form (which will focus on speaking more) or as full written answers.
2. Ask the learner to share their answer for each question. Encourage discussion of their response but don't correct at this stage.
3. Ask the learner to ask you the same question, then record your answers. Encourage discussion of your response also if the learner is interested.
4. If one of your aims is accuracy, give the learner time to correct their answers using yours as a model, then give feedback. If the learner is interested discuss and develop the language points more explicitly.

Or (for a lower level)

1. Ask your learner to ask you the questions first and record your answers. This is slightly less demanding and provides the learner with a model before writing. Encourage discussion of your response if the learner is interested.
2. Ask your learner to answer the questions referring to yours as a model – this could be done in note form (which will focus on speaking more) or as full written answers.
3. Ask the learner to share their answer for each question. Encourage discussion of their response but don't correct at this stage.
4. If one of your aims is accuracy, give the learner time to correct their answers using yours as a model, then give feedback. If the learner is interested discuss and develop the language points more explicitly.

Activity 6

Story in a Bag

This oral story-creating and relating activity works best with intermediate level and above learners. (I don't recall the origins of this activity. I picked it up from some book or workshop at least ten years ago!)

Preparation

Before class, the teacher fills paper bags with 5-6 random objects. You'll need one bag per group of four students. To make this activity interesting, the objects should be diverse and unrelated to each other. Go for a combination of the unusual and the mundane.

An example of a diverse content bag from my class is:

- a postcard from Singapore
- a can-opener
- a candle

- a surgical mask
- a theatre playbill (programme)
- a teddy bear

Procedure

At a signal, each group of students opens its bag, removes its objects and invents an oral story incorporating all the objects found in the bag. The stories become very complex and creative in order to make each object a step in the plot.

Here's an example based on the bag items described above.

"One morning Shelley received a postcard from her old college friend, Louise. The card was from Singapore, and in it, Louise had invited Shelley to come for a visit. Shelley flew to Singapore and met Louise. The first night she was there, they went to a play at a local theatre. It was a murder mystery and the ladies were feeling a bit nervous walking back to Louise's home after the show. When they got home Louise tried to turn on the light, but there was no electricity. She lit a candle andetc."

- It's important that the story be oral and not written and then read. This allows spontaneous changes, and for group members to jump in and correct each other or add details in the final telling.
- When the groups have finished, each group shares its story with the whole class. Each student in the group should tell one part and hold up the related object when it is mentioned in the story.
- Some group members may tell two parts, or tell one part that uses two objects - it doesn't matter. Most of the talking is done in the creation of the story within the group.

Watch out for those clever souls who would say "Shelley packed her suitcase for Singapore. In it she put a candle, a can opener, a teddy bear...etc."

Variation

- The teacher makes up a crime that has been committed, for example; 'Professor Whatsit found dead under a picnic table, Lady Wigglebiggle's diamonds stolen from her bedroom drawer'.
- The groups are then told that the items in their bags are clues to the crime collected by a detective. The story that the groups come up with then are the details of the crime. Here is an example.

"The teddy bear had been ripped open, to reveal a hiding place. It was now empty. The detective realised it was the place where Professor Whatsit kept the key to his secret laboratory. But how had the killer made it past the guard dogs? The can opener left on the kitchen counter was analysed and found to contain traces of dog food. Clearly, the killer fed the dogs, maybe even drugged them to keep them calm etc."

Source: Maria Spelleri, Manatee Community College, Florida, USA.

Communication Activities

Activity 7

Conversational English

Preparation

Take the script of a dialogue and blank out one half of the conversation.

Procedure

1. Hand out a gapped version of dialogue with only Steve's utterances showing and Sharon's blanked out.
2. Get your students to try to write in Sharon's lines using the clues given in Steve's subsequent respective answers.
3. Play the dialogue and get the students to compare what they hear with what they have written.
4. Give them some feedback. They may not have predicted what the speaker said exactly, but they may have given some good possible answers, so be sure to acknowledge that.
5. Write some keywords from each part of the dialogue on the board

Example:

Sharon: "...you?"

Steve: "I.... You?"

Sharon: "I.... What....?"

Steve: "Not....Busy....We....I....go...."

Sharon: "...That....When....?"

Steve: "....week....know."

Ask the students to listen again then work in pairs to rehearse and act out the dialogue.

Source: Elisabeth Boeck.

Role-Play / Acting from a Script Activities

Activity 8

Consequences Role Play

Why not play a game of consequences with a difference, where students must take on the role of another person?

Procedure

Give each student a piece of paper. On this they must first write:

1. The first name of their favourite movie star - male or female but of the opposite gender to themselves

2. Their favourite fruit
3. A number between 1 - 9
4. The names of vegetables - the same number of vegetables as the number given above
5. A job they don't like
6. Their favourite job they would like to do
7. A description of their dream house e.g., by the sea, in the mountains - using adjectives to describe this place
8. Finally, they describe what country they would really like to live in.

Now they are required to change character to the person they have described on the piece of paper. Here are what the points above mean:

- This is their husband's or wife's first name
- This is their family name
- This indicates the number of children they have
- This indicates the children's names
- This is their job
- This is the their husband's or wife's job
- This describes the family house and tells the listener where it is located
- This last point tells us what country they come from.

Students read through the points and now are told they are at a party where they are meeting famous people. Now they must introduce themselves to several people in the room as this person. They need to share the conversation, so they need to be interactive and find out about other people in the room. It may help to put them in small groups or allow them to walk around the classroom. You could follow this up by getting students to say who they felt was the most interesting person they met and why.

Source: Margot McCamley, Oman.

Activity 9

A Shopping Role Play

This activity gives learners at an intermediate level and above the opportunity to use interactional language in a role-play situation

The task of going shopping along a typical British high street. Half the class have shopping lists and the other half own a shop.

There are five shops:

- a computer shop
- a newsagent's
- a fruit shop
- a small supermarket
- a language bookshop.

The cards are structured so that some discussion and negotiation is necessary to find most of the things on the learners' shopping lists. In addition, each list also has a short task typical of normal interaction in the street, for example asking the time or directions to a bank. At higher levels learners can be encouraged to elaborate on the conversations and make them more complex.

Preparation

Before the class, copy and cut up the cards on worksheets A and B, so that there are an equal number of shoppers (worksheet A) and shop owners (B). The ideal number is five of each, you can duplicate the cards if your class is larger than 10. If you have less than 10, your learners won't be able to find everything on their lists, so warn them.

Procedure

- If you are practising language, review useful structures with the class first, e.g., *'I'm looking for a...'*, *'I wonder if you can help me, I...'*, *'How much is that?'*, etc.
- Hand out the cards to the students making sure there is an equal number of shopping lists and shops.
- Give the learners time to read their cards and ask you about any problem language. They also need to think about what they are going to say, and what language they will need. You can group the shoppers together and shop owners together to do this.
- Point out to the shop owners that they may need to decide how much their products cost before starting.
- Set up your classroom to represent a street, with each table being a shop if possible. Ask the learners who own a shop to prepare a card (folded piece of paper) saying what shop they own.
- Start the role-play. The shoppers need to find everything on their lists and complete their short task also.
- Monitor the activity for interesting language or for problems, which you can feedback afterwards. Try not to intervene too much at this stage.
- Keep the role-play going until enough shoppers have completed their tasks.
- Put the class into groups and ask them to explain how the shopping (and selling) went, and what problems they had.
- Feedback open class on any interesting language points.

By Paul Kaye, British Council

SAMPLE LESSON PLANS

Lesson Plan 1

WEIRD MUSEUMS	
Introduction	Practicing word building & word families
Goals	To extend vocabulary by practicing forming new words from stem words
Materials	Written text samples. PowerPoint slides.

Teaching Modes		Group work, lecture, classroom discussion
Time		45 + 45 (90 minutes approximately)
Procedure	Pre	1. Put students into teams of four to six to play a brainstorming game. Play 'for real' with a few other words. Here are some suggestions: photo happy friend organize luck
		2. Divide students into two groups, A and B. Give each student in group A a copy of worksheet. Students take it in turns to read out the other student's complete text from the bottom of their worksheet. Students stay in their pairs and discuss which words were the trickiest in their texts.
	While	3. They work together in small groups with the same worksheet to do the exercises.
		7. Now put students into pairs again, A and B. They exchange worksheets, and using the answer, they correct them.
	Post	8. Students work in small groups. They choose one of the four museum texts and look at the 'answers'. Then they brainstorm all of the possible words in each of the word families. When they finish, they should swap their lists with another group. Then each group checks the words in a dictionary and awards one point for each correct answer. The group with the most points wins!

Lesson Plan 2

ONLINE SAFETY		
Introduction		Talking about the use of internet & online safety
Goals		To develop students' speaking, listening, reading skills To develop students' awareness of online safety issues
Materials		Written text samples. PowerPoint slides, videos
Teaching Modes		Group work, lecture, classroom discussion
Time		45 + 45 (90 minutes approximately)
Procedure	Pre	1. Display some images of online logos, e.g., Facebook, Twitter, Whatsapp, Amazon, YouTube. Can your students identify them?
		2. Tell students about how you (or a family member or friend) use the internet, social media and your mobile phone. For example; sending emails, texts, using facebook, twitter, buying things online
	While	3. Choose one of the videos to show to your class
		4. Students do the pre-viewing vocabulary task before they watch.
		5. Ask the students to watch the video and to decide with a partner what the main message of the video is.
		6. Students check the UK online safety instructions booklet
	Post	7. Students discuss the booklet in small groups, and ask each group to report back to the class, summarising their discussions. In groups, students make posters with their top tips for staying safe online. You could display the posters and have a class vote on the poster with the best advice.

CONCLUSION

One of the best ways for learners to differentiate themselves is by having consistent performance regarding communication skills. Developing these skills requires a crucial amount of attention and effort by learners on speech part which is one of the core elements in any language system. That is why speaking skill composes the biggest burden along the

process to reach a native-like aptitude or a competent user level. The same is true of any of four skills. Yet, the intent here has been to present positive suggestions to help teachers and learners to develop or enhance their speaking skills by means of situation-appropriate activities. This chapter will assist both teachers and learners to improvise the good ones of the activities and to avoid duplicating the mistakes of the bad ones. In students' minds, the ability to speak a language is equal to knowing the language. Regarding this statement, Nunan (1991) wrote, "success is measured in terms of the ability to carry out a conversation in the (target) language." Taking this into consideration, when students cannot speak the language in the classroom setting, they may easily lose their motivation and interest. However, right speaking activities in the right time and in the right way will definitely lead to an enjoyable and beneficial learning environment.

Chapter 60

TEACHING LISTENING

Aylin Köyalan*

İzmir University, Faculty of Arts and Sciences, English
Language Teaching Department, Izmir, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. list the sub-skills of listening,
2. list the stages of a listening lesson,
3. mention the aims of each stage,
4. give sample activities for pre/while/post-listening stages,
5. explain the differences between extensive and intensive listening,
6. list some activities that can be used with songs,
7. list some activities that can be used with films.

STUDY QUESTIONS

1. Why do we teach listening?
2. What are the stages of a listening lesson?
3. What are the aims of the stages of a listening lesson?
4. What activities can be done in each stage?
5. What activities can be done using songs?
6. What activities can be done with films?

* Corresponding Author Email: akoyalan@mail.com.

INTRODUCTION

Listening is one of the basic skills because it is essential for communication. For Doff (1990, 198), if we want to improve speaking skills, or conversational skills, we need to develop listening skills; students need to understand what they hear. This can be achieved through listening to enough English at normal speed. Unless we are teaching English at a country where it is spoken, we need to give students plenty of opportunities to listen to English in the classroom.

Some people believe that listening is neglected in language teaching since it is seen as a normal reflex. “In reality, listening is used far more than any other single language skill in normal daily life. On average, we can expect to listen twice as much as we speak, four times more than we read, and five times more than we write (Rivers, 1981 in Celce-Murcia, 2001, 70). There are other studies which show the importance of listening. One of them was conducted by Wilt and it goes back to 1950s.

In this study it was found that 45% of communication was listening, 30% speaking, 16% reading and 9% writing. In another older one, Rankin (1928) found that 70% of waking time was spent communicating. In short, all these studies highlight the importance of listening and communication in English language learning. It is believed that when learners listen to authentic English video and audio materials for a long time, they can produce better sentences more quickly than learners who do not do so. This is very important for learners who are learning English in non-English-speaking countries. To illustrate, when students listen to dialogues, discussions, debates, interviews, etc., they can practice the content of various topics and vocabulary by hearing the way people speak in real life. Another useful practice can be discussing issues after listening to texts or programs in English (Shelby, no date).

To sum up, through listening, learners can modify the things they hear, and by imitating, they can learn certain structures, vocabulary items, pronunciation, and speaking skills can develop. Psychologically they will feel better and more comfortable when listening than when speaking, because they do not produce anything but just receive input.

IMPORTANT ISSUES AND FREQUENTLY ASKED QUESTIONS ON LISTENING

1. Extensive vs. Intensive Listening

In extensive listening students are asked to choose some listening materials for themselves to listen outside the class hour. The aim is just for pleasure (Harmer, 2007). When the students are engaged in extensive listening outside the classroom, they should be encouraged not to worry if they do not understand everything.

In intensive listening, which is done inside the classroom, the students do not have to understand everything, either. The aim is to complete the given task, graded according to the students' level. Sometimes teachers complain about the difficulty level of the authentic listening texts given in coursebooks. In this case, the teacher should be aware that they can change the task given in the coursebook, to suit the students' level. For example, let's imagine that the students are going to listen to the weather forecast. If the students are A1, their task

could be to note down the numbers or the city names they hear. To sum up, whether you have a difficult listening text or not, it is not important. The level of the task is important.

2. Bottom-Up and Top-Down Approaches to Listening

According to bottom-up approach, “listening is a linear, data-driven process” (Nunan, 2002 in Richards and Renandya, 235).

The listeners will be able to understand the spoken message as long as they know how to decode the text. This is a linear process because phonemic units make words, which make phrases and then sentences are formed. Meaning comes in the last position. In the other, top-down approach, meaning comes first. The listener uses different clues to get the meaning out of what he/she hears. The clues can be listener’s background knowledge of the text, the situation that the listening takes place, the speakers and their relationship with each other and with the situation at hand. For Nunan (2002), when teaching English, both of them should be used because the learner needs to be able to identify both the individual sounds and also get the general message.

3. How Many Times Should Students Hear the Text?

Another issue is the number of times we are going to let the students hear the text in intensive listening. For Ur (1996, 108), in real life we rarely have repetitions; however, in an everyday conversation we can ask for clarification; moreover, we aim to have the students to hear English over and over again. We can say that there is no danger in having students to listen to the text two or more times. If we can give them a different task for each listening, it will be better.

4. What Strategies Do Students Use to Cope with Listening?

Kaplan (2002, 42) mentions the use of three groups of language learning strategies: “metacognitive – planning, regulating, managing, etc., cognitive – those that facilitate comprehension, such as conscious use of context or background knowledge, and social and affective – for example, requests for clarification, and positive self-talk.” Studies have shown that listening strategy training has positive effects on the development of listening skills.

5. Anxiety Makes Concentration Difficult. How Can Teachers Overcome Anxiety?

Students usually find listening difficult. They are generally afraid of missing important details in listening tasks. In this case, the teacher should give importance to the activities done before listening. For example, they can give some information about the text and prepare the

students as much as possible. Some teachers spend plenty of time doing pre-listening activities so that students feel relaxed.

6. Learners Are Unfamiliar with the Topic or Culture. What Can Be Done?

Cultural differences might cause students to get confused. However, if teachers give information about the topic and the culture, they will be familiarised with it and want to listen to the text.

7. Learners Lack Motivation and a Reason for Listening. What Can Be Done?

The aim of the pre-listening activities is to give students reasons to listen. If enough time is allotted on them, it will be a valuable investigation.

8. Learners Get Overloaded by the Quantity of Information. How Can Teachers Help Students about This?

Sometimes listening texts in coursebooks are very long. After some time students lose concentration and have difficulty following the listening. Teachers can divide the text into parts and make them more manageable. In this way teachers will have fewer bored students and less discipline problems.

9. There Are Lots of Distractions and Students Lose Concentration. What Can Be Done?

In real life it is not possible to get rid of noise altogether. Students should be taught to listen without being distracted by the noise. If they can learn to listen in spite of the noise, then they will start developing listening as a skill. We can give airports as an example, neither the crowd, nor the noise can stop us from listening to the details about our flight since as soon as we hear our flight number, we will concentrate on it and try not to miss it.

10. Learners May Not Have Enough Grammar or Vocabulary. How Can Teachers Help Them?

Sometimes listening texts include unknown vocabulary and grammatical structures. In such cases teachers should look at the tasks students need to do. If the students need to know the grammatical items or new vocabulary items to do the task properly, those should be taught before the listening. If they are not necessary, they can just be neglected.

SUB-SKILLS AND AIMS IN LISTENING

Below are the sub-skills and/or aims that are frequently used by language teachers. The most frequently used sub-skill is to listen to the text and get the gist or the main idea(s). This is generally the aim of the first listening. The rest are the aims of the second listening, for example, listening for specific information. In this one, teachers sometimes give sentences to be filled in or questions to be answered. They can be true-false, multiple choice or open-ended questions, etc. The sub-skills to be developed might differ according to the learners' levels. For instance, while making inferences or drawing conclusions are suitable for higher level of students, listening and giving physical response is suitable for lower levels.

Another one is guessing the meaning of unknown vocabulary from the context. For this one, the students can be given a list of words and they can write or match the opposites or synonyms of them or they can be given definitions and write the words while or after listening.

Listening and taking notes is suitable and useful for students at higher education, especially if the medium of education is English. Sub-skills, such as; listening to check if your answers are right or wrong and listening to check for mistakes are used to encourage students to make guesses first and then listen to the text to see if they were right or wrong. These can be used with lower level students.

Similarly, listening for dictation, listening to re-order a jumbled dialogue, listening to complete a picture, listening to other learners and listening to match pictures with descriptions can all be used with students from lower levels to higher levels.

STAGES OF A LISTENING LESSON

There are three stages of a listening lesson: Pre-listening, while / in-listening, and post-listening.

1. Pre-Listening Stage

This is the stage done before the listening takes place. If we just ask the students to listen to the text, they might not listen or they might not be motivated or interested enough to listen or even if they are interested and eager to listen, there might be other distracters; such as, unknown vocabulary or structure, lack of background knowledge on the topic. In short, in order to motivate the learners to listen, to give them a reason, to arouse curiosity in students, to increase their creativity, to get their attention and increase concentration, and to clarify any unknown points, teachers should apply some pre-listening activities.

1.1. Activities for Pre-Listening Stage

1. The teacher chooses some key words, five or six, from the listening text and writes them on the board and asks the students to guess what the topic of the listening is, or the students can create a story by looking at these words, later they can listen to check the similarities and differences between their stories and the original one.

2. The teacher writes the title of the listening passage on the board and asks the students to guess what the passage is about and what the details can be. As in the previous activity the students will listen for similarities and differences.
3. The teacher tells the topic of the listening passage and tries to elicit some information on it. The aim is to see where the students are so that teacher can decide whether students need help or not. When the students do not know anything about the topic, they cannot follow the listening text.
4. Another option is to give photos/pictures related to the topic and asking the students to make up a story by using them. Later they can compare their stories with the original one.
5. The teacher can give a few topic sentences and ask the students to make predictions, etc.
6. Students can be given some questions to answer, and while listening, they can check the answers.

2. While-Listening/In-Listening Stage

In this stage the students do the tasks or activities while they are listening to the passage. Some of the aims might be to help students to get the meaning, to check comprehension and to help them to have fun and enjoy listening, etc.

Some theorists believe that the students might be distracted and lose concentration when they have to do some activities during listening and they cannot understand anything. They suggest that pre and post activities should be given more time than while-listening activities.

2.1. Activities for While / In-Listening Stage

1. Asking comprehension, true-false or multiple-choice questions.
2. Asking the students to listen for more detailed information.
3. Asking the students to complete the missing information in the tables.
4. Listen and match type of activities; for example, matching the definitions with words, the pictures with parts of the story, etc.
5. Listen and draw (the first scene, the last scene, etc.)
6. Listen and write the missing words in the paragraphs.
7. Listen and correct (the sentences, the words, etc.), the teacher gives the transcript of the passage but change some parts of it and asks the students to listen and correct them.
8. Listen and put into order; the teacher can give some sentences from the passage and ask the students to put them into order, instead of sentences, pictures or paragraphs can also be given.
9. Listen and act out the story, this can be a kind of ‘Total Physical Response’ activity, in which students perform some actions; such as, raising hands, waving, shaking hands with the person next to them, etc.

3. Post-Listening Stage

In this stage, the aims are to get feedback, to see if teacher has achieved his/her aims, to relate what they listen to real life, to teach and test vocabulary, etc.

3.1. Activities for Post-Listening Stage

1. Draw the last scene; this works very well especially with young learners since they like drawing pictures.
2. Summarize the listening text; this can be done as a writing or speaking activity.
3. Correct the sentences; this can be done as a while/post activity.
4. Find a suitable title; after listening, the students can discuss what they have understood from the text and in pairs/groups, suggest a suitable title.
5. Change the end of the listening text; the students can alter the passage in any way they like; in pairs/groups, they can either change the end, or chose a part of it to change.
6. Finish the story; when the passage reaches the end, stop the recording and ask the students to guess the end in pairs/groups, and then listen and check the similarities/differences.
7. Act out the story; when the listening is over, and if the teacher makes sure the students have understood the text, the students can be asked to perform role-plays.
8. Write a dialogue about what you have heard; in this activity, the students turn the passage into a dialogue form first and then act it out in pairs/groups.
9. Retell the story to your friend in pairs; this is a useful speaking practice activity. If the teachers can have half of the class outside, the other half can listen to the first part of the listening passage, later, the second part can be listened to by the first half. This will create information gap between the first and the second halves. Students from each half can come together and tell their parts to each other.

A GENERAL PROCEDURE OF A LISTENING COMPREHENSION ACTIVITY

1. Set the scene; for example, tell the students what they are going to hear, give brief information.
2. Relate the topic to the learners' own knowledge/experience; to illustrate, elicit from students whatever they know about the topic.
3. Pre-teach essential vocabulary, select some key words and teach them.
4. Give instructions; these are determined according to the type of activities the students are supposed to perform; such as, listening and drawing, correcting mistakes (refer to the activities listed in 'activities for each stage' part).
5. Tell the learners how many times they are going to hear the text; usually they listen for two times but it depends on the teacher's aim.
6. Set the listening task; give students the activity.
7. Learners listen and do the task.

8. Check that the learners are completing the task; while students are busy completing the activity, walk among the students, help and monitor them.
9. Check that the learners have performed the task satisfactorily; in other words, make sure they have all completed the task.
10. Get the learners to compare their answers (in pairs/groups). This is very important because when we skip this part, we elicit the answer from one or two students only. However, when they check the answers with their peers first, they have a chance to check the answer with a friend before speaking in front of the whole class and the teacher. In this way, not only more students will speak at the same time, but also shy students will gain more confidence.
11. Get the learners to agree / disagree with answer(s) – (open class); get feedback from students, make necessary explanations, etc.

SAMPLE ACTIVITIES

1. Giving students semi-scripted simulated authentic prompts, asking them to do role-play and record their dialogues. In the semi-scripts the students are given ideas to speak about. In this way, they will hesitate less and speak more (Lam, 2002).
Example activity:

Student A

Tell your partner what you do to be successful at school.

Use the following clues:

- a) Ask what he/she does about being successful.
- b) Ask if he/she wants to do other things.
- c) Ask if there are things he/she cannot do.

Student B

Talk to your friend about being successful.

Answer his/her question and keep talking

- a) Ask what he/she does about being successful.
- b) Ask about his/her opinion of the importance of being successful.
- c) Ask if there are things he/she would like to do.

Later, the students can listen to the recordings from other pairs and discuss what they have listened.

2. The teacher asks students to list the topics they would like to talk about. They write the list on the board. Later, students sit in groups.

Each student chooses one topic and speaks about it for 3-5 minutes without mentioning the topic. The other students in the group have to listen carefully and guess which topic he/ she is talking about.

USING FILMS IN THE CLASSROOM

It is a known fact that watching films builds the stamina, learners' ability to understand bigger chunks of language. For Stempleski and Tomalin (2001, 1), "the value of film as a language teaching and learning resource is self-evident. It is motivating, and it provides a source of authentic and varied language.

Many films are well-known, and some are recognized worldwide as a common frame of reference. The medium of film is excellent at communicating cultural values, attitudes, and behaviours. It is very effective at bringing the outside world into the classroom and providing a stimulating framework for classroom communication and discussion."

The following techniques are suggested by these writers:

1. Vision on/sound off: In this technique, the students are encouraged to make predictions on the language spoken and focus on explaining what they see.
2. Sound on/vision off: After the students listen to the soundtrack, they can make predictions on setting, scene, characters, what they are doing, etc.
3. Pause-frame control: Teachers can pause at various times and for various reasons; for example, at the beginning of a dialogue, teacher can pause and ask students to predict what the characters are going to say or teachers can ask students to tell each other what has happened.
4. Sound and video on: Teachers can give various tasks to students; such as, asking students to act the film out before watching and then compare their version and the film, or students can be given the sequence in mixed order and put them into order, this can be done before or after watching.
5. Split viewing: In this technique the students are divided into two groups; one group watches the film sound off, the other only hears it but does not watch it. After that, various information gap activities can be done; for example, members from each group can come together describe each other what they have watched or heard, or students can ask questions to each other to predict the missing part, etc.
6. Jumbled sequence: Teachers can divide the film into parts and show it to students in mixed order. In groups students can discuss to find the right sequence.

USING SONGS IN THE CLASSROOM

Teachers should use songs in the classroom for a couple of reasons because songs:

- are easy to remember,
- encourage listening,
- provide variety and fun,
- motivate students,
- can be used to teach culture,
- can relax a tense atmosphere,
- encourage creativity,
- include real language,

- stimulate discussion,
- present vocabulary in context,
- practice grammar items and
- are up-to-date, etc.

Activities with Songs

1. Giving pictures related to the events in the song and asking students to put them into order,
2. Giving the lyrics with blanks and asking students to listen and find the missing words,
3. Giving the lyrics with some incorrect words, and asking students to listen and correct the mistakes,
4. Giving the lyrics with some additional words, and asking the students to listen and cross out the extra words,
5. Asking students to discuss the events in the song,
6. Asking the students to act out the story in the song,
7. Using the song to practice grammar items, asking students to explain their meanings, etc.,
8. Giving some definitions / synonyms / antonyms of the words, and asking students to listen and find the related words,
9. Asking the students to compare their feelings with the singer's and discuss in groups, etc.

CONCLUSION

In this chapter we have stressed the importance of listening comprehension, the sub-skills of listening that teachers need to develop, theoretical and practical sides of listening comprehension, various activities to be used at different stages of a listening lesson and also a ready-made lesson plan which can be used in the classroom without any preparation.

We have also stressed the importance of using songs and films to practice listening and provided the readers with tried and tested fun activities. One last word from the author could be to stress the importance of integrating skills. As the reader can easily realise that in the activities mentioned in this chapter, we have used other skills; namely, reading, writing and speaking, just as we do in real life. We always use them in an integrated way.

A SAMPLE LESSON PLAN

Pre-Listening

Activity 1. Pre-teach some vocabulary items.

Ask one student to draw a picture of a rose and a spirit on the board.

Explain the meaning of thorn (show it on the picture of the rose)

Explain the difference between spirit and ghost. (Spirit is more abstract, ghosts can be good or bad, seen or heard, like father's ghost)

Write the two words on the board: 'trod – tread – trodden: stand on (you can act it out as well) and dismal: an unhappy, dark, miserable place'.

Activity 2. Ask the students: "Have you ever read / heard a story of a spirit / a ghost? Seen a film?, etc. Can you tell your friend near you?" (Students talk to each other in pairs, for 10 minutes). Later, get feedback.

While / In-Listening

Activity 3. Tell the students: "You are going to listen to an African folk tale. While you are listening, fill in the table":

Where?	From whom?	Took what?

Tell the students how many times they are going to hear the story.

Read the story, students do the task.

The Text to Be Read

African Folk Tale

A spirit went to his father and said:

'Father, I want to be alive.'

'That is complicated,' his father told him.

'To be alive you must first think, next you must remember, then you must feel, then smell, after that you must see, next hear and finally when you can do all these things you'll be alive.'

'How can I do this?' the spirit asked.

'Go and walk in the world,' said the father, 'and get what you can where you can.'

The spirit followed a path through the forest of the world and met a young man. The man sat under a tree and frowned.

'Man,' said the spirit, 'please help me, I want to think.'

'To think you need a mind,' said the man.

'Can I have your mind?', asked the spirit.

'Certainly,' said the man and after he gave away his mind he looked happy and young.

'Oh Father, help me,' the spirit suddenly cried in fear.

'Walk on through the world,' his father said, 'he who thinks also fears.'

The spirit came to a village and found an old man.

'Man,' said the spirit, 'please help me, I want to remember.'

'To remember you need a memory,' said the man.

'Can I have yours?' asked the spirit.

'Certainly,' said the man and after he gave away his memory he looked happy.

The spirit looked at the path ahead but could not remember which way to go.

‘Oh father, help me,’ he cried. ‘Walk on through the world,’ his father said, ‘he who remembers also forgets.’

The spirit came to a thorn tree and found a boy crying there.

‘Man,’ said the spirit, ‘please help me, I want to feel.’

‘To feel you need feelings,’ said the boy.

‘Can I have yours?’ asked the spirit.

‘Certainly,’ said the young man and after he gave away his feelings he looked happy.

Then the spirit trod on a thorn.

‘Ah,’ he cried, ‘Father help me.’

‘Walk on through the world,’ his father said, ‘he who feels also feels pain.’

The spirit came to a dead animal and found a child sitting there holding his nose.

‘Boy,’ said the spirit, ‘please help me, I want to smell things.’

‘To smell you need a nose,’ said the boy.

‘Can I have yours?’ asked the spirit.

‘Certainly,’ said the boy and took his hand away from his face.

The spirit smelt the dead animal and felt ill.

‘Oh father, help me,’ he cried.

‘Walk on through the world,’ his father said, ‘he who smells also smells bad things.’

The spirit came to a dismal place without trees or flowers. He found a man there covering his eyes.

Man,’ said the spirit, ‘please help me, I want to see.’

‘To see you need eyes,’ said the man.

‘Can I have yours?’ asked the spirit.

‘Certainly,’ said the man and smiled.

‘Oh father, help me,’ cried the spirit. ‘this is a terrible world.’

‘Walk on through it,’ his father said, ‘he who sees also sees bad things.’

The spirit came to a house where someone cried. He saw a man there blocking his ears.

Man,’ said the spirit, ‘please help me, I want to hear.’

‘To hear you need ears,’ said the man.

‘Can I have yours?’ asked the spirit.

‘Certainly,’ said the man and smiled.

‘Oh father, help me,’ cried the spirit when he heard a cry ‘what is this sad sound?’

‘Walk on through it,’ his father said, ‘he who hears also hears bad things.’

(Students compare answers. Later, check the answers with the whole class)

Post-Listening

Activity 4: Ask the students to complete the story. Write a paragraph to end it.

After the students finish writing their paragraphs, read the last part of the story.

‘Then the spirit saw the most beautiful woman and loved her instantly.

‘Beautiful woman, help me,’ he said, ‘I can think, I can remember, I can feel and I can smell, I can hear, and even see you but still I’m not alive.’

‘To live you need life,’ said the beautiful woman.

‘Can I have yours?’ asked the spirit.

‘Certainly, because I love you,’ said the woman and instantly died.
 ‘Oh father, help me,’ cried the man in terrible sorrow when he saw his love was dead.
 ‘Walk on through the world,’ his father said, ‘they that live also die.’

Homework: Give students a list of activities to choose from:

- draw pictures about the story, or
- write lyrics / a poem telling the story, or
- make a list of things the spirit takes from whom, or
- be ready to tell the summary of the story in the next lesson.

Chapter 61

INTELLIGIBILITY IN PRONUNCIATION TEACHING: A STUDY OF ACCENTED SPEECH OF TURKISH SPEAKERS OF ENGLISH

İrfan Kuran

Kocaeli University, Faculty of Education,
English Language Teaching Department, İzmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. list prevalent segmental problems in Turkish learners' L2 English speech.
2. have a repertoire of activities to help their future learners cope with certain segmental problems in their oral production of English.
3. become aware of the significance of intelligibility in L2 speech instead of insistence on the pursuit of a native-like attainment.
4. provide their learners with examples of L2 English speech similar to that of their own to increase their motivation in speech.

STUDY QUESTIONS

1. What is your attitude to accented speech? Have you ever considered the common pronunciation mistakes your learners make?
2. Do you think that native-like speech is indispensable from foreign language learning/teaching?
3. Have you ever considered intelligibility as an important aspect of oral communication?
4. What were (might be) some problems that you may encounter while teaching pronunciation?
5. What sort of phonological problems do you think are most difficult to handle?
6. What do you do about the recursive mistakes in your learners' pronunciation?
7. How do you feel when/if your own pronunciation mistakes are noticed by your interlocutors?

INTRODUCTION

This chapter examines the segmental and supra-segmental problems in a short excerpt from video recordings of accented speech and argues that it does not necessarily cause intelligibility problems and can be used as a model for ESL learners with the same L1.

The informants used in this study are, Galip Abacı and Aylin Dolu, pseudonyms for two senior students at the English Language Teaching Program at Kocaeli University, Faculty of Education. The two informants were videotaped during thirty minute interviews at the faculty of Education while answering questions about their opinions about Turkey's foreign policy.

My reason for studying accented but intelligible speech samples is that I find it interesting not only because it is a reality but also a very viable option for the majority of EFL/ESL speakers worldwide who are not likely to attain native-like L2 speech no matter how hard they try.

As Murphy (2013:5) suggests “accented speakers may serve as more realistic models of L2 pronunciation achievement and, in many cases, of societal accomplishment as well.”

Furthermore, “the speaking proficiency of an AIC (accented, intelligible, and comprehensible) speaker of English represents a sufficient and attainable level to which pronunciation teachers can feel confident in encouraging learners to aspire” (ibid.).

The idea of intelligibility has become central to the teaching of pronunciation... the idea was slow to feed through to practice, but in the 1970s many English teachers worldwide came to realize that it was unrealistic, time-consuming and potentially inhibitory to aim for a native like accent (Field, 2005:400). This led to the abandonment of traditional checklist approaches to pronunciation instruction and intelligibility was adopted as a criterion. (ibid.).

As a Turkish L1 speaker myself, I think that there is great potential in focusing on speakers like the two senior ELT majors at a Turkish university in that they are very likely to be perceived as intelligible hence successful EFL speakers by a possible target audience of this work, my first year undergraduate students at the EFL Education program of Kocaeli University in Turkey.

DESCRIPTION AND ANALYSIS

The instructional component of my project is designed for the first year students at the undergraduate program of the Foreign Language Education Department of The School of Education at Kocaeli University in Turkey. The students attend a two semester advanced Listening and pronunciation course including instruction and practice on both learning and teaching listening comprehension and the sound system of English. The majority of the students have Turkish as their native language with up to 5 foreign exchange students from mainly the Turkic republics in central Asia and other regions such as Japan, Poland, Nigeria, Kosovo and Former Yugoslav Republic of Macedonia. They aim to become English teachers at K12 level. EFL instruction in Turkey begins at grade 4 in primary level of an 8 year compulsory education system. Most of them want to be employed at government schools where the focus is on the communicative aspects of language learning according to the official syllabus designed by the ministry of education. But due to lack of quality supervision and quite a safe job security environment most teachers ignore the communicative aspects of

language teaching and adopt a grammar based approach in their instruction. Other graduates of the program get jobs with private language schools and university foundation courses, which are one year preparatory programs organized by the foreign Language schools of each university with a small minority moving onto higher academic programs for research purposes.

The four year program itself is essentially a teacher training one with strong emphasis on educational science courses instructed in L1 while every other course has English as the medium of instruction. The final year has a strong focus on the teaching practicum during which senior students do an observation based course in the fall semester and a practicum course in the spring term which is supervised by one of the faculty member and a coordinating teacher at the school where the practicum takes place.

Students enrolled in the program have to take a proficiency exam testing listening, speaking, reading, writing and grammar, which is devised and administered by the Foreign Language Education department and those who fail the test have to do the one year preparatory foundation course instructed by the same department staff.

Due to the lack of communicative focus on language teaching at primary, middle and secondary schools most students lack speaking skills and do not have a satisfactory conduct of the sound system of English. They are generally good at other aspects of language.

Students do not have much of a chance of practicing their English with native speakers, for which reason the faculty usually recruits native speaking English teachers to teach courses at preparatory and undergraduate levels. The program has one full time and one visiting American instructor at the moment. There are official restrictions limiting the number of foreign employees to a certain percentage.

THE PRONUNCIATION ISSUES TO BE ADDRESSED

For this chapter I have analyzed the interviews with Galip Abacı and Aylin Dolu. My reason for focusing on the two speakers is that their English is heavily accented and the phonological problems they display are highly representative of that of the English speech of a typical Turkish L1 speaker.

In spite of the phonological problems their speech contains, both speakers are fairly fluent and intelligible. Neither interviewer seem to be having difficulty understanding them and it would not be wrong to say that they do not create comprehensibility-related problems for their interlocutors.

I believe that the accented but intelligible quality of these speakers' English is likely to appeal to my undergraduate students, the target audience of the instructional extension of this study, in that they will find a lot of commonality between them and their own L2 speech. This aspect is worthy of consideration as it can be quite hard at times to encourage L2 learners with accentual problems to keep trying to perform speech in the target language when they when they find it hard to this without risking loss of a certain degree of self confidence. Exposure to the accented intelligible speech samples of these prominent speakers will hopefully provide them with the encouragement they need for L2 production.

Both speakers display good communicative skills. They are quite fluent and maintain smooth conversation. They are both good at thought grouping, perhaps their biggest strength that compensates for the weaknesses in articulating certain sounds.

Their speech contains occasional inaccuracy in word stress patterns but it does not prevent the general quality of their performance.

THE ANALYSIS OF THE DATA AND THE PRIORITIZATION OF THE PRONUNCIATION ISSUES

It is possible to analyze the data at hand from a segmental and supra-segmental perspective but for the sake of clarity and practicality I am going to address the segmental elements in the speakers' spoken conduct.

Figure 1.1. features the problem areas in both speakers' performance based on my analysis of the complete interviews. The words appearing on the chart are not the only problematic ones in the speech samples of my two informants and I have chosen them as they represent frequent articulation difficulties in relation to certain vowels and consonants. There are other occasional examples of outstanding pronunciation problems such as the pronunciation of the word "change" as /...../ and "urban" as /...../ by and but due to their low frequency I thought I would exclude them from this chapter.

What follows is the list of prevalent segmental problems in both speech samples and the justification of my selection.

1. Devoicing of the alveolar sibilant.
2. Devoicing of stops in word final position.
3. Tendency toward changing the quality of tense and lax vowels.
4. Articulation of the voiced, bilabial, semi-vowel.
5. Articulation of the voiced and voiceless dental fricatives.
6. Absence of the mid-central, lax vowel in certain words.
7. Articulation of the voiced, labio-dental, fricative.

1. *Devoicing of the alveolar sibilant*: Turkish normally has this sound in word final position still it is one of the most common articulation problem for most students. The problem is there is a great tendency toward devoicing the same sound in the same position in Turkish, hence the transfer into L2 use.

2. *Devoicing of stops in word final position*: This is another common problem for Turkish speakers of English as Turkish does not allow voiced stops in word final positions apart from the borrowed words, which are also devoiced when they become a part of the Turkish lexicon. e.g., "kart" for "card", "bar kot" for "bar code" and "Arap" for "Arab".

3. *Tendency toward changing the quality of tense and lax vowels*: This prevalent deficiency in Turkish L1 English speech results from the fact that Turkish does not have tense vowels and the same sound is produced with the presence of post vocalic (g) which is silent and lengthens the vowel it follows.

The reverse case, where a lax vowel gains a tense quality can only be explained with the overgeneralization of the rule that multisyllabic words in English have a prominent syllable and its prominence is usually highlighted by Turkish speakers through increasing its length rather than making it stronger or louder.

	Galip Abacı	Aylin Dolu
Devoicing of the alveolar sibilant	means- standards-others countries-ties-something friends-neighbors-wills	atrocities-shelling(s)- cities civilians-massacres-towns institutions-processes involves-colleagues-affairs Syrians-rebels-generals cities- news-areas-meetings declares
Devoicing of stops in word final position.	and-of- negotiating-doing making-solve-good-negative	Changed-world-arrived bloodshed-reforms-Arab league-road(map)-supported need-concerned-road-huge collective-stage
Tendency toward changing the quality of tense and lax vowels	meaningful-criteria- unique position-pillar(s)-region interesting-agenda-position policies	regime- Armenian-three decision-Syrian-transition regional
Articulation of the voiced, bilabial, semi-vowel	ownership –will-well powerful	Own-law
Articulation of the voiced and voiceless dental fricatives	This-that-there-then-this	truth-other
Absence of mid-central, lax vowel in certain words	capacity-agenda-adopting standards-problem-America domestic-them-referendum majority-amendments-super determined-focus-Balkans terror-energy-cooperation atomic-diplomacy-embassy professors-attacked-modern	Successful-international approaching-aggression agreed-moment-accept terrorist-collective commitment-actors-observe potential-cooperation
Articulation of the voiced, labio-dental, fricative	Very-level-have – positive values-value	collective-of-five-have-level violating-heavy-prevent observer-intervene-every

Figure 1.1. Problem areas to both speakers' performance.

4. *Articulation of the voiced, bilabial, semi-vowel*: Most Turkish speakers exaggerate the articulation of this sound thinking that they must do this as the orthographic representation of this sound as a letter does not exist in the Turkish alphabet while the sound does exist in the language represented by the letter (v).

5. *Articulation of the voiced and voiceless dental fricatives*: These sounds simply do not exist in Turkish, hence the difficulty.

6. *Absence of mid, central, lax vowel in certain words*: This sound exists in Turkish but it is represented by the Turkish character (ı) and it is not necessarily used in weak syllables only. Therefore Turkish speakers have difficulty articulating this sound in weak syllables with various orthographic representations.

7. *Articulation of the voiced, labio-dental, fricative*: The main reason for the difficulty caused by this sound is that it does not exist in Turkish and the orthographic symbol (v) has the sound of the voiced, bilabial, semi-vowel, which confuses students and hence the problem.

AN INSTRUCTIONAL PLAN FOR ENHANCING THE SPEECH INTELLIGIBILITY OF THE TARGET POPULATION

The teaching context is a two semester advanced listening and pronunciation class at the undergraduate TEFL program of a Turkish university where the majority of the students speak Turkish as their native language with a small minority of multi-language background. The learners are prospective English teachers who need to improve their written and spoken conduct of English along with pedagogic make-up. The class of 50 students meets once a week for three 50 minute slots. The course also has a listening comprehension focus and provides learners with opportunities to improve their oral communication skills. The medium of instruction is English and the instructor communicates with the students in English outside of classes, too.

Lesson I

Activity 1

Proverbs are short sayings that teach lessons. As general truths, proverbs are often expressed in the present tense. Underline the nouns and verbs ending in - s. Say the proverbs with the teacher or speaker on audio. Or take turns saying the proverbs with a partner.

Proverbs	Meaning
1. Absence makes the heart grow fonder.	a) It is better to show than to tell.
2. When life gives you lemons, make lemonade.	b) Time passes quickly when you are enjoying yourself.
3. The early bird catches the worm	c) Many projects require a community
4. No news is good news.	d) A lack of something increases your desire for it.
5. Haste makes waste.	e) make the best of what you are given in life.
6. It takes a village.	f) Success comes to those who put in effort.
7. Time flies when you are having fun.	g) Bad news travels faster than good news
8. Actions speak louder than words	h) If we do things quickly, we make mistakes.

Grant, L., 2010.

This activity is ideal in that it allows for comparing and contrasting proverbs with likely equivalents in many languages. The recording helps learners hear the correct pronunciation of the – s ending, which is consolidated with the strength of the content of the proverbs. Every time the learners think of the proverb they will remember and reproduce it with accuracy in wording and pronunciation.

Activity 2

With a partner, take turns saying the sentences. Link the – ed endings to the next word.

This activity has great potential for Turkish students, who find it hard to voice the stops in word final positions. Here their awareness is raised by the help of the linking job they have to perform. While they are connecting the two sounds they have to recognize the difference between the voiced and voiceless alternatives, which is likely to increase their accuracy. A

bonus of this activity is its potential to help them develop the skill of putting the utterances into thought groups subconsciously.

- 1 That was already pointed out.
- 2 Carlos majored in economics.
- 3 I need something called a USB drive for my computer.
- 4 You'd better get that checked out.
- 5 The teacher doesn't expect that to be handed in.
- 6 They used to be apartments. Now they're condos.
- 7 He already filled out the form and turned it in.
- 8 I went back and looked at my notes.
- 9 *Harry Potter* turned out to be a great movie.
- 10 Which countries refused to sign the treaty?

Grant, L., 2010.

Note: two sentences have – *ed* endings that get lost.

Activity 3

Scrambled mini dialogues for practice with /θ/ and /ð/

With your partner produce mini dialogues choosing one suitable response from column B to the utterances of your partner A from column B. pay close attention to the sound of the combination of letters (th).

This activity, although basically designed for developing accuracy in the articulation of the /θ/ and /ð/ sounds, has a strong communicative value. Students not only have to be aware of the existence of the sounds in question but also listen to each other carefully to respond to the prompts in a meaningful way.

Partner A	Partner B
1. Let's ask Thelma to join us on me! Thursday for your birthday.	a. This heat spell will be the death of me! I can barely breathe!
2. Thad and I are through! I've thoroughly lost my faith in our	b. I agree. It's a health hazard. Let's both go throw a fit and demand another room!
3. Is your new boyfriend wealthy?	c. Yes, I always use it when I bathe. It has such a nice lather.
4. I think Beth is too thin, don't you?	d. Have you thought about couples therapy? Maybe you can both work through your differences with a good therapist.
5. This hotel room is filthy! Everything is covered with dust.	e. Let's ask Ruth instead. I loathe Thelma!
6. They say the weather forecast is for continued temperatures in the high 30s!	f. Yes, he has a house worth about three hundred thousand dollars!
7. This bath gel is very soothing.	g. She is a lot thinner than she was before. But she looks healthy to me!

Celce-Murcia, 2011.

Lesson II

Activity 1

This next activity is an enjoyable one devised by Bowen (1972) to practice final consonant distinctions. It is based on pairs of index cards with drawings representing minimal –pair contrasts. On the front of the card is a minimal-pair sentence; on the back is a visual that cues the minimal pair.

Front	Back
1.a. He looked at her eyes	(image of eyes)
1.b. He looked at her ice.	(image of a glass full of ice)
2.a. They 're beginning to leave.	(image of people walking to the exit)
2.b. They 're beginning to leaf.	(image of two trees losing their leaves)
3.a. He's gone to get a cab.	(image of a man hailing a cab)
3.b. He's gone to get a cap.	(image of a man hailing a cab)

Adapted from Bowen, J. D., 1972, in Celce-Murcia, 2010.

This activity is best implemented with one student making the utterance and his/her partner producing the gesture of holding an imaginary glass of ice or one student producing the gesture and the other one making the utterance for the gesture performed.

Consequently this activity will likely encourage body movement, which is good for kinesthetic learners and may help overcome the challenge of focusing on the vowel length by involving them in the heat of a game-like activity.

Activity 2

A listening activity for sound discrimination:

Listen to the paragraph. Fill in the blanks with words that have the /v/ sound. Check the answer key.

VALENTINE'S DAY

All _____ the world, it is popular to _____ cards, flowers, gifts, and other tokens of _____ on February 14, St. Valentine's day. There are _____ explanations for the origin of this holiday, the most believable is that St. Valentine's Day is a _____ of February 15th Roman _____.

During this festival, bachelors picked names of women to _____ who their "valentines" would be for the coming year. The couples then exchanged gifts and sometimes even became engaged.

Adapted from Grant, L., 2010:181.

This guided activity focuses students' attention to a particular problem sound that does not exist in Turkish. It also provides them with some cultural input about the target language, which students can compare and contrast to those of their own. It is contextualized and not mechanical and this is another strength of the activity.

Activity 3

A listening activity for sound discrimination:

Which word in each pair has the /v/ sound, the first or the second? Close your book and write one or on a piece of chapter.

a. very	wary	h. vow	wow
b. very	where he	i. vie	why
c. west	vets	j. boats	votes
d. veil	whale	k. ban	van
e. wheel	veal	l. vary	berry
f. verse	verse	m. have it	habit
g. evoke	awoke		

Adapted from Grant, L., 2010:180.

Lesson III**Activity 1**

A listening activity for sound discrimination:

Listen to the teacher or the speaker on audio say each word twice. Each time you hear /ə/, put a line through the vowel.

Examples: MET- Ød	
DI – Ø - logue	
1. spe - CI - fic	7. OR - e - gon
2. de - VE - lop	8. EX - cel - lent
3. an - NOUNCE - ment	9. DE - mon - strate
4. con - CLU - sion	10. PRE - si - dent
5. pro - FES - sion - al	11. CA - len - dar
6. OR - gan	12. SPE - ci - fy

Adapted from Grant, 2010:71.

This activity is supposed to help students gain the ability to spot the use of the /ə/ sound in weak syllables of multisyllabic words. As it is a very common problem for them to articulate this sound this controlled activity would be beneficial for the Turkish learners to spot the sound as they will hardly miss it and hopefully develop awareness toward articulating it accurately in weak syllables. The clarity of this task is the strength of this activity and it will likely increase their sound recognition and production skills. As Levis and Grant (2003) argue, incorporating work on word clarity includes two major elements; students' choices and the teacher's feedback, both being quite functional in this activity.

Activity 2

A Communicative activity:

Pair Work

Use the following sentences to create a dialogue with your partner. You should listen carefully to the word the salesman chooses of the minimal pairs provided.

When you hear a devoiced /f/, respond by choosing the word that starts with a devoiced /f/. When you hear the voiced /v/, respond by choosing the voiced /v/. You can check your work by listening for context.

Example:

Salesman: Welcome. I have a **FEW** / view things I would like to show you!

Buyer: That's vine / **FINE**. I would like to get started.

Salesman: What kind of _____ would you like to buy? There are a vast/ fast number of options to choose from.

Buyer: I am not very / ferry good at making decisions.

Salesman: If you choose today, I'll take one thousand dollars of / off the price.

Buyer: How fast / vast does it go on the highway? Can we take it for a test drive?

Salesman: If you don't belief / believe me, we can take it on the highway.

Buyer: I will be relieved / relief.

Salesman: You have / half my word.

Buyer: Great! Then I choose the red fan / van.

(Or match to this pair, according to voicing.) Great! Then / thin it's a deal!

What is the customer trying to buy? Circle the correct answer. **FAN** / **VAN**

Adapted from Gilbert, 2012.

This activity is quite strong in terms of its communicative, meaningful and challenging nature. The challenge does not lie in the difficulty of the task but the requirement that the students focus on the voicing of the consonants, which is usually a big problem for Turkish students. Therefore, this activity promises focus on the voicing issue while the students enjoy the conversation between the salesman and the buyer.

CONCLUSION

The activities listed above are all designed for Turkish speakers' general segmental problems of spoken production in English. They are based on the analysis of the data gathered from two videotaped interviews with senior ELT majors in a Turkish University hoping that they will provide good models for students having similar accented speech production.

As the data mostly presented segmental elements as problematic, this chapter had its focus on the design of activities to deal with those specific problems, which does not mean that supra-segmental aspects of the English sound system do not cause Turkish speakers any problems.

It has just not been made a focus of this chapter but I strongly believe that the analysis of similar data highlighting those problems must be studied in the confinement of other studies preferably integrating both segmental and supra-segmental aspects of speech, which are inseparable from one another for the sake of intelligible and comprehensible speech.

Chapter 62

VOCABULARY INSTRUCTION IN EFL CLASSES

Ihsan Unaldi

Gaziantep University, Faculty of Education, English
Language Teaching Department, Gaziantep, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. define related terms like the followings: word, vocabulary, corpus, contextualized and decontextualized learning
2. discuss about vocabulary sizes that EFL learners need at various levels of proficiency
3. elaborate on three different approaches to vocabulary instruction

STUDY QUESTIONS

1. How do you think people learn the vocabulary of their native languages?
2. How do you think people learn the vocabulary of a foreign language?
3. Could there be only one most effective way of learning foreign language vocabulary?
4. Is every word in a foreign language worth learning?

INTRODUCTION

The shift from form-focused foreign language instruction paradigm to a lexically oriented one has been voiced for more than a couple of decades.

Although lexical competence was already defined as one of the most crucial indicators of general language ability decades ago (Carter and McCarthy, 1988), some other researchers, after a couple of decades, stated that L2 lexicon is in a rediscovery period (Meara, 2002). This means that the importance of lexicon in a foreign language has always been accepted but has only been gaining attention recently.

As is always the case, when a topic is considered to be worth learning, the well-known questions what to teach about the topic and how to teach it arise.

What Is Vocabulary?

When talking about *words*, most of the time, we take the topic so much for granted that when confronted with the question ‘*What really is a word?*’ there seems to be no straight comeback. From a phonetic aspect, in the natural stream of speech, there is a linguistic process called segmentation which refers to physically or auditorily identifying discrete units (Crystal, 2008: 426).

In one’s mother tongue, it is actually quite easy to draw the lines between sounds and meaningful units in an utterance, but when we stop and think about it, the concept of *word* should start to look like a delusion.

Especially while listening to people with foreign languages, the fact that we cannot put *spaces* between their words might make us think that those people are speaking too fast.

The spaces that we assume in-between words mostly come from the orthographic approach (the written forms of words) to language; that is, after frequent encounters with the written forms of words, we start imagining spaces that separate one word from another.

When a word is considered from a semantic point of view, it is not that easy to establish a straightforward connection between a single word and a particular meaning. The semantic conventions in any language could be deemed to be arbitrary.

The word *elephant* for example doesn’t look like a big animal, nor does it sound or smell like one. What you call an *elephant* in English, is actually called *tembo* in Swahili, *xiàng* in Chinese and something else in another language.

A word can also be analyzed from a grammatical standpoint. Its affixes (prefixes and/or suffixes) or its place in a sentence or an utterance might affect its meaning and function. In this respect, words are considered as *mobile*. In order to convert a statement into a question, we can simply change the position of an auxiliary verb.

Not uncommonly, some words are mobile without that much changing the meaning or function. The positions of adverbs in English are more flexible when compared to other units in a sentence. For example, the following three sentences have the same meaning although the adverb *sometimes* has different positions in each of them.

- Sometimes, when they were bored, they would go out to a park.
- When they were bored, they would sometimes go out to a park.
- When they were bored, sometimes they would go out to a park.

To go even further, pragmatics could be used as a benchmark to examine lexical items. Pragmatics is often contrasted with semantics in that while semantics deals with words and meanings, pragmatics tries to deal with meanings in context. For example, the word ‘great’ could mean wonderful in one context while in another it could be used in a quite sarcastic manner.

As can be deduced from the above discussions, defining what a word or the concept of vocabulary is takes a multiple approach.

Therefore, vocabulary can be defined as the body of words and phrases in any language which have phonologic, orthographic, semantic, syntactic and pragmatic dimensions.

The English Lexicon

The concept *lexicon*, synonymous to vocabulary, refers to all the words and idioms in any language (Richards and Schmidt, 2002). The number of lexical items in the English language has always been a topic of discussion (see Crystal, 2004 for an overview). There are claims that even the most conservative estimate of English vocabulary could not go below a million lexemes (Crystal 2004: 119). In this respect, the term lexeme actually refers to the basic form of a single word without any inflections. For example, the lexeme *eat* can be modified to fit into different syntactic environments and might appear as *eating*, *ate* and *eats*. This lexical capacity of the English language shouldn't come as a surprise as it is like an amalgam of Anglo-Saxon, Latin, French and several other languages. The point that should be considered carefully at this point is that it is virtually impossible to teach or learn even what could sound like a small proportion of the English lexicon in a limited time. This is an important issue to be resolved if, as language teaching practitioners, we want our learners to construct an expedient and functional foreign language lexicon in an appropriate amount of time.

Target Vocabulary Size in a Foreign Language

With the framework that has been discussed thus far, it should be clear that the target vocabulary size of a foreign language learner should be one of the most important issues to be discussed and agreed on before beginning a language teaching program. When we consider that about more than 80% of the words in any given text in English actually comes from the top 2000 most frequent words in English (O'Keeffe, McCarthy, and Carter, 2007), we could suppose that 2000 words would be enough to comprehend a text written in English. However, the situation is not that straightforward. Nation (1992) suggests that in order to be able to read an unsimplified text in English for pleasure, the reader needs a vocabulary size of around 5000. As digital databases regarding the English language become greater in size, it also becomes relatively easy to deal with issues related to its vocabulary. In this respect, if an instructor wants to determine how much of a reading material at hand corresponds with the most frequent words in English, all s/he has to do is to input the material into a database like Vocabprofile and determine its lexical nature. In a very short time, the instructor will reach a statistical analysis of the material, which will equip him/her with a certain level of prediction about what might happen during the actual vocabulary teaching activities.

Receptive vs. Productive Vocabulary

Receptive vocabulary refers to the amount of words that an individual can recognize and understand while listening or reading. Productive vocabulary, on the other hand, refers to the amount of words that an individual can use actively in language production, that is, while speaking or writing. One could suppose that receptive vocabulary of an individual is more

than his/her productive vocabulary. When we consider how it is crucial to have explicit knowledge about the vocabulary size of an individual or a specific language learner group, its determination becomes a very serious problem to be tackled. Compared to productive vocabulary size, receptive vocabulary size is relatively easier to determine.

With an orientation to determine English vocabulary sizes of individuals, Nation and Beglar (2007) developed a variety of vocabulary size tests. The main aim of their study was to create multiple choice tests by which language learners' vocabulary capacities could be determined in a relatively less complicated procedure but with more representative lexical items. Representativeness of such vocabulary size tests is potentially problematic in that the number of the words that can be tested is limited while the actual vocabulary size of the target language is extremely large. In the abovementioned study, through some statistical procedures, items with high levels of representativeness were chosen. Figure 1 displays a sample screenshot from one of these tests which was digitalized and freely available online at <http://my.vocabularysize.com>.

In this test, individuals who are taking the test have to make choices depending on the clues given about the target word. In Figure 1, the target word is *standard*, and it is presented in a meaningful sentence. Test-takers are required to select from five options including *I don't know*. At the end of the test, they get a score, and this score is used to make inferences about their vocabulary size by measuring their knowledge of the most basic form of a word and assuming that other forms can also be recognized. Related estimates about vocabulary size for reading and listening are also mentioned at the end of the same test as following.

It is quite clear from Table 1 that an EFL learner needs between 8,000 and 9,000 word families to read or 6,000-7,000 to listen effectively. At this point it should be borne in mind that these figures do not refer to individual lexemes in English lexicon, but rather word families, which means that this total amount actually represents individual variations of the word 'help' like helpful, helpless, unhelpful, helpfully and etc.

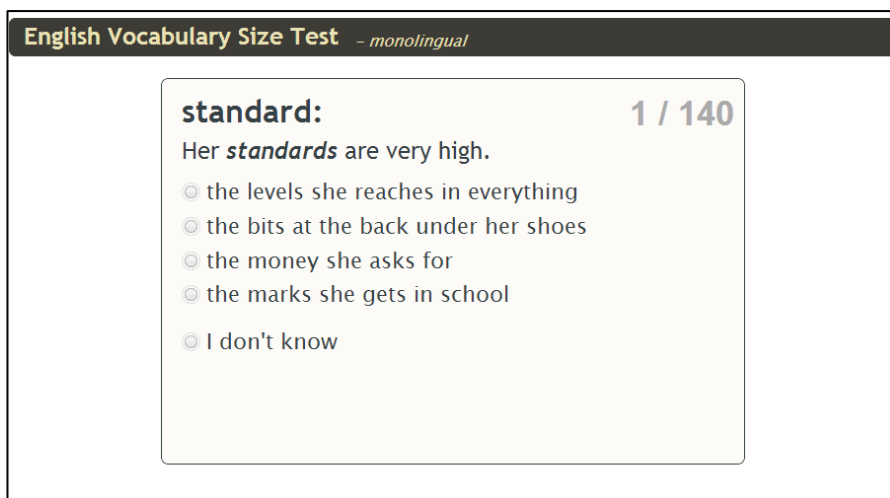

Figure 1. A screenshot from one of the vocabulary level tests developed by Nation and Beglar (2007).

Table 1. Vocabulary size needed for reading and listening

Skill	Size estimate (word families)	Notes
Reading	8,000 - 9,000	Nation (2006)
Listening	6,000 – 7,000	Nation (2006)
Native speaker	20,000	Goulden, Nation, and Read (1990) Zechmeister et al., (1995)

Breadth and Depth of Vocabulary Knowledge

Vocabulary learning might erroneously be regarded as a kind of piling up process. According to this point of view, which is not that rare, a foreign language learner will learn a new word at some point, and then at another occasion s/he will learn another one, and put the newly learned one into his/her mental vocabulary list like putting coins into a piggy bank. This seemingly piling-up process is often referred to as the *breadth of vocabulary*. Nation (2001) divides learners' lexicon into two aspects as breadth and depth. Breadth is actually the number of words a learner knows.

On the other hand, depth of vocabulary knowledge refers not only to word meanings, but also other parameters such as semantic relationships, collocations and syntactic patterning which is related to parts of speech of lexical items. For example, an EFL learner might be familiar with the word 'wise' /waɪz/ at a very superficial level. S/he could be aware that this word refers to experience and knowledge.

However, when the word becomes wisdom /'wɪzdəm/, its word class and pronunciation change significantly and a stress pattern also emerges because of the syllable added.

Furthermore, the word 'wise' might be used in a sarcastic manner as in 'wise guy' which refers to a person who is trying to be overly and disturbingly smart. The same expression might also be used to refer to people involved in the mafia. At this point, it should be noted that the process of building even a barely passable vocabulary will take deeper understanding of connections among the words that are being learned by the individual.

One last important theoretical point worth mentioning is the authenticity issue. Using authentic materials in language teaching has been a common sense among theoreticians and practitioners as well (see details in Gilmore, 2007). Authentic materials are produced in order to fulfil some social purpose in the language community. The producer of the material doesn't have a specific learner group in mind during the process of creation. Through the use of authentic materials, learner motivation can be improved by exposing them to real language and cultural aspects of the target language; moreover, such materials relate more closely to learners' needs in addition to providing the instructor with a more creative approach to teaching (Peacock, 1997). Sometimes it is discussed that it is actually not the material itself that should be authentic but what is done with it. However, one thing is sure that made-up language with no communicative purpose doesn't help the language learner in anyway.

What Does It Mean to Know a Word?

When we take into consideration the definition of word mentioned before, the concept of ‘knowing a word’ should have a clearer meaning. If one is claiming that s/he knows a certain lexical item, s/he has to be familiar with its phonological, semantic, syntactic and pragmatic dimensions. At this point, a knowledge of orthography (how the word is represented with letters) is not a must when we consider illiterate people who can communicate with others by using the sound system of their native language. For such people, in order to understand a word, there is no need to see it in written form.

In relation to this point, receptive knowledge of a word’s sound patterns, and productive knowledge as to its intelligible pronunciation is the first and maybe the foremost aspect of vocabulary knowledge. Then, of course, a dictionary-like semantic knowledge is needed for successful communication. However, as is the case with dictionaries, there will be many alternatives for a corresponding reference about the target word.

This will enforce a pragmatic approach to the word at hand because the context where the word is being used will help the individual to appoint an appropriate meaning to it. This kind of approach will also help the individual produce socially acceptable utterances because although knowing when to use a word is important, sometimes knowing when not to use it becomes more important. Meanwhile, the syntactic structure of the word is also a part of the process because syntactic knowledge will promote interpretations concerning the part-of-speech of the word.

PRACTICAL TIPS

Contextualized Vocabulary Learning/Teaching

The assumption underpinning contextualized vocabulary instruction is the common sense that when learners put enough effort in order to make some sense out of a new word in its own context, this effort will somehow pay off and after several other encounters with the new word, it will be learned and retained. This point of view about vocabulary acquisition/learning is maybe one of the most well-established issues after decades of discussions (see Craik and Tulving, 1975; Jacoby, Craik and Begg, 1979 for the early discussions; and Nation, 2011 for a more recent one). Theoretically speaking, there seems to be nothing wrong with this insight; however, it is a common idea among EFL learners that sometimes the instructors spend too much time trying to contextualize just one word for minutes.

Many studies suggest that EFL learners learn and retain vocabulary better when the target words are presented in a meaningful context and the learners actively try to deduce the meanings of these target words from this context (Nation, 1982; Nation and Coady, 1988). According to McCarthy (1990), a lexical item which is learned in a meaningful context is best assimilated and remembered. The effectiveness of learning vocabulary items in a foreign language can be discussed when these items are stored in the learner’s long-term memory. Oxford and Scarcella (1994) mentions that while decontextualized vocabulary learning may help language learners memorize vocabulary for tests, students are likely to rapidly forget words memorized from lists. Moreover, learning in a context provides the learner with both the linguistic features of a word, such as phonetic, syntactic and semantic rules and the

knowledge of how to use the word properly in a context (Lu-Fang Lin, 2010, p. 63). Even if most vocabulary is learned from context, which would involve the presentation of the word within a sentence, it cannot be concluded that it “is the fastest or most efficient way of learning specific vocabulary” (Sternberg 1987: 94). These ideas seem to be widely accepted by language teaching practitioners. Indeed, very few language teachers would find the idea of writing down the target words on the board and teaching them without contexts attractive.

The results of some related studies about the issue have suggested that in order to be able to guess a word from its context at least 95% coverage is needed (Laufer, 1989; Liu and Nation, 1985). This means that if we want to make guesses about an unknown word by making use of its context, we need to be familiar with the majority of the words surrounding it. Say we have a paragraph made up of 100 words. We can make effective guesses up to five or six unknown words; our efficiency in comprehension of the paragraph will go down as the amount of unknown words goes up.

Supposing that the learners are trying to deal with a reading passage where they are familiar with more than 90% of its vocabulary the following five steps suggested by Coady and Nation (1988: 104) could be taken to guess the meanings of the unfamiliar words in the text.

1. Finding the part of speech of the unknown word.
2. Looking at the immediate context of the unknown word and simplifying this context if necessary.
3. Looking at the wider context of the unknown word. This means looking at the relationship between the clause containing the unknown word and surrounding clauses and sentences.
4. Guessing the meaning of the unknown word.
5. Checking that the guess is correct.

These steps are, of course, flexible to some extent, but one point is worth mentioning. As one might guess, these steps will take some time to accomplish. Time, for language teachers in particular, is more than important.

This is why, in the determination process of the target vocabulary to teach, only the ones which will worth spending time on should be foregrounded.

Decontextualized Vocabulary Learning/Teaching

According to Oxford and Crookall (1990) we can talk about decontextualized learning when the word is removed from any communicative context that might be a clue for the learner to remember and that might make any sense about the actual use of the word as a part of the language. Similarly, Nation (2001: 100) explains decontextualization as the removal of a word from its message context to be focused on as a language item.

Among language teachers, there has been an ongoing myth about the fallacy of trying to teach new words isolated from their contexts. This must-learn-in-context motto might be one of the most common views among practitioners. However, like many conventions this one is also widely accepted and is rarely questioned. There are studies whose results claim that decontextualization of target vocabulary could be more beneficial especially at beginning

levels. (see a recent study Unaldi et al., 2013). Mnemonics, wordlists, flashcards and dictionaries etc. are some examples of decontextualized vocabulary learning/teaching techniques. In addition, words grouping, word or concept association, visual imagery, aural imagery, keyword, physical response, physical sensation, and semantic mapping could be regarded as semi-decontextualized vocabulary instruction techniques (Hague, 1987 and Carrell, 1984). When the topic of discussion is decontextualized vocabulary learning, using context-free mnemonics to teach vocabulary in a foreign language is one of the first techniques to come to minds. The reason why it is called context-free is not because mnemonics are totally free of context but because the stories or images created using mnemonics actually lack the traditional sense of context. The term mnemonic comes from Greek and means related to memory. This memory technique is useful when some rote learning is needed. The term rote learning refers to the learning process in which no connection can be created between the new input and the already available mental inventory.

For example, when we are supposed to memorize a phone number, since connecting arbitrary numbers to what we already know will be very difficult, most of the time we will fail to remember it after sometime. This type of learning is often referred to as rote learning. In terms of foreign language vocabulary instruction, the first attempt was the mnemonic key word method developed by Atkinson (1975). In this method, sound associations lie at the core of learning foreign vocabulary. The sounds of the target word is associated with any possible word in the native language. For example, the word for young girl in Spanish is *chica* which sounds like the word *cheek* in English. Once this word association is made, mental images about the words are created. By using the English word *cheek*, a mental image is created for the Spanish target word *chica*. The image could be someone kissing a *Spanish girl* on the *cheek*. The effectiveness of this technique has been a research topic for some time now (see Cohen and Aphek, 1980 and Campos and Gonzalez, 2003).

Semantic word mapping is a vocabulary teaching technique which is also common among language instructors. In order to make sense out of a target word, the teacher encourages language learners to create a network-like image for it without referring to a context (see Figure 2). In semantic mapping, contrary to word grouping, words are both put into categories and the conceptual links or paths among the words are presented (Hague, 1987 and Carrell, 1984). Semantic mapping might be suggested to improve comprehension and retention of vocabulary for language learners. Oxford and Crookall (1990) summarize Hague's (1987) six steps for using semantic mapping as follows:

1. Write the target word on the chalkboard or transparency.
2. Have the class members brainstorm words related to the topic.
3. Write/list the words by categories in the form of a map.
4. Have the students provide labels for each category (optional).
5. Discuss the words on the semantic map. Students should be encouraged to discover how the concepts are related to each other.
6. Revise the map after discussion, if necessary. Add new concepts to the map as the lesson progresses.

Figure 2. A sample semantic mapping for the word storm.

Using semantic mapping vocabulary activities is claimed to have greater effects on vocabulary acquisition compared to the context clue approach or the traditional dictionary-definition-plus-example approach (Margosein et al., 1982). In this study, it was stated that semantic mapping technique motivates the language learners to connect their prior knowledge to target words and this technique also allowed them to see the lexical relationships among words.

Another way of learning/teaching vocabulary through decontextualized means is the paired-associate technique. In this technique, the learners are exposed to the target words in pairs and challenged to recall the target word depending on its pair. This technique is reported to be more useful than trying to remember target words in sample sentences (Prince, 1996). Context-based vocabulary learning is thought to be suitable at later stages of language development (Coady, 1997; Nation and Newton, 1997).

It has also been stated that “especially at the beginning levels the teaching of words lists through words association techniques has proven to be successful way to learn a large number of words in a short period and retain them over time” (DeCarrico, 2001: 288).

Since there seems to be no exact answer to the question whether trying to deal with foreign language vocabulary in context is the most appropriate way one or not, the language instructor has to be flexible about the techniques being used in the language classes. Decontextualized vocabulary instruction will probably cause a one-dimensional learning. In other words, through these activities, the learners might fall into the trap of thinking that each word in the target language has only one equivalent in their own mother tongue. Therefore, their vocabulary learning experience will fall short of depth.

Using Corpora to Learn/Teach Vocabulary

This is a separate heading because teaching vocabulary by using corpus-informed activities could be placed both under the heading of contextualized and decontextualized vocabulary learning/teaching because in corpus-informed vocabulary activities there are contexts but sometimes too many of them. At this point, it should be remembered that a

corpus is a systematically collected and digitally stored database of naturally occurring spoken or written language samples. By using such databases, researchers try to turn intuitions about the nature of languages into well-supported arguments. If the related dataset is available, by going through very simple steps, one can see a list of the most/least frequent words in a language within seconds.

Apart from such basic usage, deeper insights might also be gained by means of corpus queries. The internet and other digital media sources have helped researchers to store tremendous amounts of texts on computers. British National Corpus (BNC), for example, includes about 100 million words, and Contemporary Corpus of American English (COCA) operates on nearly 500 million words. Through the use of such enormous databases, new perspectives on lexical items, especially for the English language, have been gained. Accordingly, there has been a well-established and growing emphasis on the concept of *collocation* throughout years. Collocation basically refers to the fact that words in a given context do not act in isolation but rather in pairs or groups. For example, the verb *agree* seems to have close relationships with the words *strongly* and *experts*. In other words, it is very possible to see one or even two of these words together in a context where the verb *agree* is present.

Therefore, we can say that the adverb *strongly* and the noun *experts* are collocations of this verb. To go even further, some researchers have come up with a way of defining the negative or positive atmospheres or the aura of meaning created by certain words. For example, in the English language, the word *cause* mostly collocates with negative events such as accidents, problems, deaths or damages. In the natural course of speaking or writing, a native speaker of English would not use the word *cause* with positive connotations. The vast amount of repetitions of such occurrences yielded the common idea that these are patterns rather than idiosyncrasies.

One of the most common concepts that surface when the topic is corpus linguistics is concordancing. Briefly, concordancing is a collection of the occurrences of a word-form, each in its own textual environment, and in its simplest form it is an index (Sinclair, 1991: p. 32).

Through concordancing lines, it becomes possible to see a target word in its natural environment. In terms of language pedagogy, Thurstun and Candlin (1998) suggest some simple steps when using concordancing lines in vocabulary instruction.

- Look – Screening for the key words to learn and the other words surrounding it
- Familiarize – Referring to the concordances to familiarization with the target word
- Practice – Trying to remember the target word without referring to the concordances
- Create – Trying to create a piece of writing

Through these steps, a new word might become more and more familiar to the learner. First of all, the part of speech of a word and its variations are very likely to become clear. That is, in one line the word may appear as a noun while in another the same word might function as a verb. This also provides the learner with a flexibility with lexical items, an insight which will help them to better understand the fact that a word might have several meanings and several functions in different context.

The transfer of such insights about the English language into EFL classes seems to have the potential of transforming the whole concept of foreign language pedagogy.

Recently, there are hardly any dictionaries or language teaching materials which don't somehow refer to a professional or academic corpora.

However, the practical potentials of such corpora in vocabulary learning/teaching process remain yet to be seen.

SAMPLE ACTIVITIES

Thematic Teaching Scenarios

With an aim to make more sense out of the theories about vocabulary that have been mentioned up to this point, the following reading passage, an adaptation of a story from Mawlana Jalal ad-Din Rumi, will be used in all of the sample vocabulary teaching activities.

As was mentioned previously, the vocabulary profile of this story will provide us with insights as to the vocabulary level to which it can be taught.

In order to do this, this passage should be rendered in the Vocabprofile database. After this simple process, the following screen shows up ready for further analysis.

Xenduu and the old man Once there was a man. His name was Xenduu. He was not wise, but wanted other people to think that he was wise. He used to walk around in his town and try to show off his wisdom. One day he got on a ship to travel to another country. He wanted to show his wisdom to other people too. On the ship, he saw an old man and asked him: - Tell me old man, do you know any mathematics? The old man said: - No, I know no mathematics. Xenduu went on to ask: - How about philosophy old man? Do you know anything about philosophy? - No, I know nothing about philosophy, said the old man. Xenduu answered back: - Then old man, half of your life is in vain. As time went by, when everything was fine on the ship, suddenly a storm broke out. The ship started to shake very badly. Things weren't that good. The ship was in the middle of the sea, and it was very dark and raining heavily. There was no hope for help either. Everybody was praying. Xenduu came across the old man. The old man asked this time: - Son, do you know how to swim? - No, not a bit, answered Xenduu in fear. This time, the old man answered back: - Oh, I'm so sorry, but your whole life is in vain.
--

In the outcome screen in Figure 3, it is obvious that about 96% of the reading passage actually involves lexical items from the first 2000 most frequent words in English. The interesting point here is the distribution of the first (K1) and the second (K2) 1000 words.

Among these, eight of them (3.91%) fall into 1000-2000 range, which means that this reading passage is appropriate for learners who are slightly above or below the first 1000 most frequent words in terms of recognition.

	Families	Types	Tokens	Percent
K1 Words (1-1000):	86	100	211	91.74%
Function:	...	...	(111)	(48.26%)
Content:	...	...	(100)	(43.48%)
> Anglo-Sax	...	...	(86)	(37.39%)
=Not Greco-Lat/Fr Cog:	...	...		
K2 Words (1001-2000):	8	8	9	3.91%
> Anglo-Sax:	...	...	(6)	(2.61%)
1k+2k			...	(95.65%)
AWL Words (academic):	1	1	3	1.30%
> Anglo-Sax:	...	...	()	(0.00%)
Off-List Words:	2	2	7	3.04%
	95+?	111	230	100%

Figure 3. Vocabulary profile of the story Xenduu and the old man.

The database also provides us with valuable information as to which words fall into which vocabulary range through colors. According to the results, the following eight words *vain*, *storm*, *raining*, *suddenly*, *swim*, *bit*, *sorry* and *pray* fall into the second 1000 range. Therefore, it is supposed that these must be new for the learners.

Of course, because of individual differences, some learners might already be familiar with these words, which implies that the initial vocabulary size tests are really important.

Now that the material is analyzed and the vocabulary items to focus on is made clear, the instruction process will be demonstrated through three main scenarios: contextualized, decontextualized and corpus-informed.

The Contextualized Scenario

Activity 1. Guessing the Meaning Out of Context

It makes sense to consider lexical items in a text or a natural conversation as components of a bigger dynamic system. In other words, rather than at sentential level, words actually bind at higher levels. This is why, it is important to make use of reading activities such as skimming, scanning and mapping before dealing with the target vocabulary.

As was mentioned previously, the reader has to be familiar with at least 95% of the vocabulary items in a text to be able to make deductions about a word. The first step to take while trying to guess an unknown word in a context is to determine its *part of speech*. Is the target word a verb, noun, an adjective or an adverb? For example, in the sample story the new word *break out* appears to be a phrasal verb as it comes after a subject, a storm, and used with a preposition *out*.

Since it is a verb, the subject has to be taken into account at this point. When the learners are encouraged to think about what a storm can do, the options will be quite limited, but at this point, the instructor should not spoon feed the learners quickly with the meaning and should make them struggle a bit in the process. Photos or pictures involving a storm and people panicking could be shown to the learners and they could be asked to make sense out of the following sentence: *A storm broke out, and the people are in panic.*

At the end of such contextualized meaning guessing activities, it is crucial that the meaning, senses and the potential contexts of the target word are provided by the instructor.

Activity 2. Negotiation Activities

In negotiation activities, the learners discuss about the meanings and associations of the target words in small groups. No dictionaries are allowed, only the context of the word is used to make a common sense out of it.

The discussion can be carried out in the learners' native languages at low levels, and in the target language in the higher proficiency levels. For example, in the story there is a man who thinks he is wise and he is trying to show off his wisdom to others. He is talking about mathematics and philosophy. The learners are encouraged to talk about his behaviors focusing on the word 'wise'.

In the teacher-monitored discussions, the learners are supposed to come up with an agreement about the meaning of the word 'wise'. It could be claimed that telling the students its meaning would be a quicker way of teaching. This claim might make some sense in the short term, but if the vocabulary item which is chosen to be taught is really important, the focus should be on the long term effects of teaching.

Any word with very low frequency can be made clear by the instructor without any extra activity in order to make time for words with high frequency.

Activity 3. A Box of Words

This could be counted as a continuum wrap-up activity in which the learners try to remember and internalize the target words that they have covered recently and get ready for the new words. This activity could be very useful after the target words have been introduced in a meaningful and interesting context. Most of the time, a small box with some paper will be enough. The paper is cut into small pieces, and one target word will be presented with three of them: one piece for the target word, one for the context in which it was learned and another for the translation, the synonym or the antonym of the target word. Let's say, ten new words were introduced to the class the day before, 30 small pieces of paper will be needed. The target word will be written on one piece, its context will be written on another and its translation into the learners' native language will be noted on the last one. The same procedure will be carried out for all of the ten target words. At the end, the teacher will have a box full of words with their meanings and contexts as in Figure 4.

The next thing to do will be to hand around the box in the classroom and let every student get one or two pieces according to the number of the students in the group. When the box is empty, the first random learner holds up her hand and reads what is written on her paper. The aim here is to encourage the learners to remember either the learning context from which the word is taken or its meaning or any related information about it. The teacher instructs the students to check their papers. The learners who have the context or the meaning written on their papers also hold up their hands and try to bring back the word, its context and meaning together. When this matching is done, the teacher can comment on the word or highlight important things to remember about it, then collects the three pieces from the students and puts them back into the box. Since vocabulary learning is a cumulative process, new words are added with each lesson. However, the teacher should take out the target words that have been covered and learned well to avoid a pile-up.

Target word	Translation and/or synonym or antonym	Its context
vain	without success, useless	Xenduu and the old man

Figure 4. The target word ‘vain’ along with its meaning and context.

The Decontextualized Scenario

Activity 4. Semantic Mapping

In this decontextualized vocabulary teaching activity, as was explained earlier, the target word is written on the board and the learners are encouraged to relate other words to it and thus create a network-like map for the target word.

This map could be extended as much as possible as new concepts are added. The learners might be allowed to use bilingual dictionaries. However, some caution is needed not to lose focus of the target word by involving words which are relatively distant to it. For example, although the word *problem* is related to the target word *pray*, other words related to *problem* might lead the process off the track.

Figure 5. A sample semantic mapping for the target word PRAY.

The front side	The back side
pray	to talk to God

Figure 6. Two sides of a sample flashcard for the target word ‘PRAY’.

Suppose that one of the learners tries to relate the word *school* with the word *problem*, which is not that far-fetched actually, the instructor might end up discussing school problems with the whole class.

This network-like connection (Figure 5) scheme created as a sample for the target word ‘pray’ will raise awareness among learners as to the operating principles of words. It should be made clear to the learners that it is quite unlikely for an isolated word to convey meaning or create a meaningful context.

In the long run, this will encourage language learners to focus on the potential connections of a new word rather than trying to deal with it through isolation. An example of such isolation is flashcard studies.

Actually, it is a quite traditional way of learning new words. On one side of the card, the target word is written, and on the other side related information such as meaning in the target or the native language, synonyms, antonyms or any kind of descriptions are put down. Sets of decks are created, and as the learners become more familiar with them after frequent and systematic expositions, the words that have been learned (or memorized) are removed from the deck. A sample flashcard is given in Figure 6.

In the figure above, both the front and the backside of a single flashcard is given. This activity actually isolates the word from its context, which might look like a sort of rote learning. However, this does not mean that language instructors should avoid this activity. This kind of learning or reinforcement could prove helpful especially when used as a complementary to the main learning/teaching process.

After some meaningful learning which is full of contexts and connections, flashcards might be a practical way of not letting go what have already been covered. If they so choose, the instructors should encourage learners to use decks, carry them around and try to study the new words and carry on this activity with new decks as new words are introduced during the lessons. Mobile flashcard applications could be a substitute for the classical paper ones as the language learners of this age are closer with digital technologies than then they are with paper.

Activity 5. Mnemonics

The next sample decontextualized teaching activity is related to mnemonics. Although its effectiveness is still being discussed, some language teachers try to make use of the mnemonics while trying to teach vocabulary. In our context, one of the target words, *vain*, seems to be appropriate for such a use because this word sounds like Wayne, the last name of a renowned actor John Wayne (1907-1979). After instructing about the most frequent use of the word as pointless or meaningless, the learners could be provided with some background knowledge about the famous actor. With a couple of sentences or pictures, an image about the famous dead actor is created in their minds. It could be mentioned that he was a great actor and he influenced people all around the world. After this step, the following sentence is written on the board.

It's a *vain* to wait for a new movie from John *Wayne* because he is dead.

The sentence itself is may not be natural, but it sure creates a phonetic association which can be manipulated to make sense out of the word *vain*. Since the sentence also has emotive associations because of the word *dead*, it is expected to affect the retention of the target word in the long run. However, considering that lexical items have several aspect to be taken into account, this learning/teaching technique might not be as effective as it seems to be. To begin with, the seemingly phonetic association between the two words is only an assumption, as is usually the case, because the phonetic transcription of *Wayne* /weɪn/ begins with a rounded semi-vowel w whereas the word *vain* /veɪn/ begins with the consonant v.

Furthermore, the collocations, connotations and the semantic prosody of the word *vain* might be very different from those of the surname *Wayne*. To top it all, it is virtually impossible to create stories or images about every word in a language. The trick with his kind of vocabulary instruction is that only the words which have potentials to create stories with are chosen to demonstrate the effectiveness of the technique.

Even if a story could be created for every important lexical item, after sometime the associations between the target words and the created stories or images might be forgotten

which will make the learners end up with bunch of stories and images with no corresponding words. All in all, the mnemonics technique might be effective in developing the breadth of vocabulary knowledge in a foreign language, but it sure will not help learners to improve its depth.

The Corpus-Informed Scenario

Activity 6. Concordancing Activity

In this scenario, the learners are instructed through corpus data. After the reading activities which will help the learners to familiarize with the context and the new words in it, the learners are provided with a variety of contexts for each item through concordancers. The following is a screenshot from one of these concordancers showing the results for the target word 'wise'.

The concordancing lines provided above make it possible to see the natural contexts of the target word 'wise'. Its neighboring words or phrases like *wise decision*, *wise economic advice*, *wise response*, or *wise public policy* all have the potential to create some sense about the target word.

1. _____	2. _____	3. _____	4. _____
~ money	~ history	~ progress	~ policy
~ resources	~ mention	~ performance	~ recommendations
~ funds	~ sojourn	~ compliance	~ strategy
~ energy	~ introduction	~ standards	~ reforms

Figure 8. A sample concordancing activity to teach vocabulary.

A quick collocation query about the same word will yield its first 10 collocations in COCA as follows: man, men, decision, guy, choice, decisions, movement, wise, choices and investment.

In order to visualize what kinds of concordancing activities could be used in vocabulary teaching, the following activity can be checked as an example (Schmitt and Schmitt, 2005: 196).

In the activity which is illustrated in Figure 8, the target vocabulary items to be taught are presented at the top, then the learners are asked to guess which of the collocations given below the target words are most likely to occur with them. This activity is a good demonstration of the collocational tendencies of the words, which might help language learners to improve a more sophisticated understanding of English lexicon rather than a simplistic one. In addition to this, if carried out in pairs or groups, this activity social learning might as well be promoted by way of negotiations over collocations.

CONCLUSION

In a science fiction movie, *Phenomenon* (1996), George Malley (John Travolta) suddenly becomes superhumanly clever after some complications in his brain. Before long, he becomes a nationwide concern.

As usual, the government is involved, and his intelligence is to be tested. During this testing period, the following dialogue takes place between one of the government officials, Bob, and George Malley.

Bob: All right, I'll start the questions, and I'll be timing your responses. And we'll be recording. Any questions?

George: What's your first name?

Bob: Uh, my first name is Bob.

George: Shoot, Bob.

Bob: Answer as quickly as you can. How old is a person born in 1928?

George: Man or woman?

Bob: Why?

George: Specifics, Bob.

Bob: Okay, one more time. How old is a man born in 1928?

George: Still alive?

Bob: If a man is born in 1928, and he's still alive, how old is he?

George: What month?

Bob: If a man was born October 3, 1928, and he's still alive, how old is he?

George: What time?

Bob: 10:00. P.M.

George: Where?

Bob: Anywhere!

George: Well, let's get specific, Bob. I mean, if the guy's still alive, born in California, October 3, 1928, 10:00 p.m., he's 67 years, 9 months, 22 days, if he's born in New York, he's three hours older now, isn't he?

The relevant point to the dialogue above is that foreign language instructors generally have to deal with the following question: *How should we teach or learn vocabulary?* The reply should not be a statement but questions including specifics like the followings:

- Who are we teaching to?
- What is the purpose of learning? (to pass an exam, find more job opportunities or have fun)
- What is the learners' proficiency level?
- Is it a foreign or second language that we are trying to teach?

No one approach or technique will suffice in the process of teaching and learning vocabulary of a foreign language. The language practitioner will have to make use of a variety of techniques whose rationales might lie in contrasting approaches.

For example, translation of a lexical item from one language to another might be deemed a teaching fallacy, or making the learners use word lists or flashcards could be dubbed old-fashioned and uncommunicative. However, as language teachers, our main purpose should be to do whatever is necessary to help learners survive even if sometimes the practice seems to be incompatible with the well accepted theories.

As they say, sometimes *old tricks are the best tricks*. That's why, some conventions about learning and teaching in general should be taken into account.

First of all, trying to make use of the learners' vocabulary which is already available could be a start. Determining their vocabulary size, and then extending it with new inputs through meaningful connections between the two will be an effective way. Trying to push the learners to extremes will not work most of the time. Being aware of their proficiency levels and individual capacities, the instructor should aim at teaching new vocabulary a bit beyond their reach. In addition to this, no matter how intelligent a learner is, it will still take some time for the new vocabulary items to settle in. Therefore, the instructor should always remind the learners that learning doesn't happen overnight. Another simple but effective way is to encourage the learners to take one step at a time; rather than trying to rush learners into uncharted waters, the instructor should create an atmosphere where the learners can see both where they have been and where they are heading to at the same time.

Another convention worth mentioning is that learning vocabulary is a cyclical, ongoing and cumulative process. Exposing learners to the target vocabulary items to teach for the first time is the first step in this procedure. After a short time from the first exposition, let's say next day if possible, the learners should recycle these target vocabulary items.

Meanwhile, they should meet some other new words. By the next session, the new words that they have been trying to learn will have formed some sort of accumulation onto which other new items are to be added through meaningful connection. Of course, in the process, authentic materials should be used as much as possible while trying to deal with new words. Last but, of course, not least, vocabulary learning should also start from 'now and here', and then move on to more abstract items especially with younger learners.

A SAMPLE LESSON PLAN

In order to visualize vocabulary teaching process better, the following lesson plan for pre-intermediate EFL learners can be used. As usual, the teaching plan is static and based on common assumptions about the supposed learners. The teaching process is based on one of the teaching scenarios which was mentioned before.

Level: Pre-Intermediate

Skills objectives: Contextualized vocabulary instruction through reading

Target words: wise, show off, vain, suddenly, break out, pray, come across, swim, and whole

Materials: Reading passage - Xenduu and the old man

Stage 1 (about 10 minutes):

- Build background knowledge about the story.
- Discuss about the difference between theoretical and practical knowledge.
- Show some photos or pictures about sea voyages and share related ideas.

Stage 2 (about 5 minutes):

- Introduce the target words by writing them on the board.
- Ask the learners to pay more attention to these words during the activities.
- No pre-teaching of the target words is needed.

Stage 3 (about 20-25 minutes):

- The learners skim the reading passage.
- A class discussion about the story is carried out.
- The target words are highlighted.
- The learners are encouraged to think about the parts of speech of the target words.
- Syntactic relations of the target words are discussed. If the target word is a verb 'who does it?', if it is an adjective 'what does it modify?' etc.
- The learners, in pairs or small groups, try to guess the meanings of the target words one by one. No dictionaries allowed at this point.
- Confirm or correct the guesses of the learners, encourage them to refer to a monolingual dictionary for more information about the target words.
- Students read the passage for deeper comprehension.
- The main idea of the reading passage and comprehension questions are discussed.

Stage 4 (about 5 minutes):

- Review the target words with references to the story.

Chapter 63

TEACHING WRITING

Tülin Yildirim*

English Language Instructor, Kocaeli University, School of Foreign Languages,
Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to

1. evaluate and select appropriate writing activities according to learners' characteristics.
2. provide feedback on students' written work in different ways.
3. select valid transparent assessment criteria for different writing activities.
4. design effective lesson plans on writing.

STUDY QUESTIONS

1. Why should we teach writing?
2. What writing activities should students do in and outside class?
3. Should teachers correct every mistake?
4. How should teachers assess students' writing?

INTRODUCTION

One day an English teacher goes into the English class, and hears some students talking about writing in English. "Do you like writing?" asks one of them to the others silently. Most reply anxiously and simultaneously "Nooo!!" The answer is unfortunately but not surprisingly a big "No" and the teacher feels a bit desperate. "It is difficult," one says. The

* Corresponding Author Email: tulin.yildirim@yahoo.com.

other adds “I simply can’t write.” “It takes time,” another says. One murmurs “It’s boring. I hope this new teacher knows what to do.” Hopefully, the new teacher knows how to overcome these problems in an EFL/ESL class.

What makes writing in English somewhat difficult for learners is a matter question for teachers of English for ages. Writing is productive skill and requires thinking many aspects of language such as sentence structure, grammar, spelling, vocabulary, punctuation, layout besides the content, organization, feedback and the grade they will get. Furthermore, if time is limited while writing, then the murmurs start in the EFL/ESL class. How did you feel as learners when you were assigned to hand in a written work in your English class as a young learner?

On the other hand, do teachers like teaching writing? Most teachers will probably answer this question hesitantly as they think about the workload after students have written any kind of text, then start asking “Why should we teach writing? What writing activities should we do in class? Will we correct every mistake? How will we correct and assess them? How will we give feedback to each student?” The answers of all these questions have to be clear for both English teachers and EFL/ESL students. Therefore, when the right decisions are given, the right steps are followed in teaching writing to students in an EFL/ESL class, students become more motivated and encouraged to write in English and teachers are more willing to do writing tasks.

WHY SHOULD WE TEACH WRITING?

Writing is one of the four main skills in language learning and one of the productive or active skills besides speaking. None of the skills can be excluded in language teaching and they can only be thought in an integrated way. In daily life or in careers every person has the need to write something. Therefore, the learners of English need to be able to communicate in writing. As teachers of English, we teach writing to students in an EFL/ESL class mainly for three reasons which include language development, literacy and writing skills. (Harmer, 2007)

First of all, all writing activities directly contribute the development of language use in English for students. While writing, students practice the language itself to be able to convey the meaning they want. To decide what structure and what words to use is a hard process for learners, which creates the actual need for language use. When students really have felt the need to use the language, then learning occurs.

Literacy or being literate is another requirement for EFL/ESL students and defined as the ability to read and write in a language. One aspect of literacy is handwriting which can be problematic if not eligible enough especially for learners from China, Russia, Japan where the orthography is different. The other aspect of literacy is spelling as the sounds and the letters of the words are not the same in English. Teachers should let students discover spelling rules through different activities in class. Poor handwriting and spelling can distract the reader which can lead to undesirable effects particularly if the text is formal or going to be assessed in an exam. Punctuation and capitalization are other issues in English teaching. Some languages have differences such as in giving quotations, use of commas or the capitalization of ‘I.’ Moreover, EFL/ESL students need to know functional literacy, which is more than

simply doing reading and writing in class. (Thornbury, 2010) Knowing what layout the writing requires is important for functional literacy. For example, emails, newspaper articles, essays have different layouts. Students should be aware of all these aspects of literacy to be able to function effectively in English context.

In addition to the development of language and literacy, students need to learn writing skills such as writing formal and informal e-mails or letters, constructing well organized paragraphs. Moreover, if they are learning it for academic or business English, they want to know how to write essays or reports, integrating information from different sources and citing them.

In order to improve literacy, dictation activities can help students a lot. Teachers can dictate new words, sentences or paragraphs to students and they write what is dictated. It does not take much time as long as the dictated part is short. You will see how difficult it is for lower level learners and make them realize the importance of spelling. However, you should keep in mind that full accuracy in spelling cannot be expected at all levels. Sample dictation activities are below:

Sample Activity: Dialogue Dictation

The teacher dictates a dialogue from course books or relevant to their context twice. Students work with their pairs and each pair write one person's line. So that it is easier to catch up with the dialogue. At the end, to check the correct version, the teacher can project it on the board or give the print version if needed. Next, students can read aloud the dialogue and then they may be required to write a similar dialogue. Alternatively, the teacher can dictate it with missing words calling them "elephant" like "Can you come elephant Monday elephant 3 o'clock?" and ask them to find the missing prepositions. Running dictation is another version (Harmer, 2006). The texts are on the walls in or outside the class. One pair runs to the text, read and come back to his/her pair to dictate. They should dictate in meaningful chunks. The teacher can also dictate emails requiring a different layout to improve functional literacy more.

The secretary: Hello. It's Mr. Clerk's clinic.

The patient : Hello. It's Mike. Can I make an appointment with the doctor, please?

The secretary: Of course. Can you come on Monday at 3 o'clock?

The patient : I'm sorry. I have a class at 3.

The secretary: Can you come on Tuesday at 4 o'clock?

The patient : Sure. That's OK.

The secretary: That's on Tuesday on 24 April, at 4.

The patient : OK. Thanks a lot. Bye

The secretary: Bye.

Sample Activity: Punctuating and Completing a Joke

Teacher gives a partly punctuated text and the students complete the punctuation and correct capitalization. Then, they can compare theirs with the other pairs. Next, the teacher

puts the correctly punctuated version on the board, OHT or projected computer screen. Alternatively, the teacher can stick the text on the walls so that kinesthetic learners have the opportunity to move in the class. They come, read and go back to check them. Moreover, the last sentence of the joke is not given. Students are required to come up with an ending in groups. At the end, each group reads aloud the ending and then compared with the original one. Students can come up with more creative endings. This activity can be adapted to any kind of text, any joke or a paragraph in students' course books.

The teacher is giving one of her pupils, Patty, a maths lesson. "Patty, if I give you two rabbits and two rabbits and another two rabbits, how many rabbits have you got?" the teacher asks. Patty replies seven the teacher says no listen carefully if I give you two rabbits and two rabbits and another two rabbits how many rabbits have you got seven replies Patty. lets try this another way says the teacher. If I give you two apples and two apples and another two apples how many apples have you got six says Patty good says teacher now I give you two rabbits and two rabbits and another two rabbits, how many rabbits have you got Patty replies seven the teacher is getting cross and asks how. Patty replies ... (Arnott & Haskins, 2004)

(Patty replies "Because that's six rabbits plus the one I've already got at home!")

Activity: In your groups, find more activities to improve spelling and punctuation.

WHAT WRITING ACTIVITIES SHOULD LEARNERS DO?

While deciding what writing activities students do, teachers should consider the aims, level and age of students. At first, the aims of learning writing should be set clearly in the ESL/EFL classroom so that the writing tasks can be chosen appropriately and authentically. In this process, teachers should discuss the aims with the students, check the national curriculum requirements, and if relevant future career requirements. Then, they should list the aims and determine what they need to write in the English context. For example, if they are learning English for their career or academic purposes, they might be required to write reports, well organized essays or explain graphs and tables. If they are learning English for general purposes, they will need to write emails, letters, text messages, notes, etc. If they are studying for an international exam which requires essay writing such as opinion, comparison, process or argumentative ones, they should be thought how to organize their ideas effectively in different essay types. If they are preparing for graduate studies which require summarizing many articles, they should be reading and summarizing articles in class.

Another criterion to choose activity is the appropriateness of the activity to the levels of the students. The activities should fit to the students' level of proficiency. For instance, teachers should not ask students to write essays or expect them write on abstract topics at lower levels. Common European Framework (CEF) provides a good reference for determining tasks and the expectations of teachers according to the levels of the students. To illustrate, B2 learners "Can write a review of a film, book or play." (CEF, 2001) Therefore, teachers should not expect lower level students write detailed reviews.

The students' age is another factor that determines the type of task or the content of task. For example, if they are young children, teachers cannot ask them write longer or on abstract topics. For younger learners, the task should be short and simple as their concentration duration is limited.

Moreover, before students start writing, teachers should provide them with enough exposure to real life samples and analyze them together in class. When the activities are "authentic, real-life like providing readership (having a specific reader in mind)" (Thornbury & Watkins, 2007), they directly contribute to the aims and students can link the activity to the aims better. Therefore, the aims should be clear and transparent to the students so they become more motivated.

Activity: What type of writing activities have you done in your English classes so far? Complete the table below in pairs. Then discuss how you can make the activities more effective.

Activity Type	Aim: Why do you write it?	Authenticity: Is it a real-life activity?	Readership: Does the writer have a specific reader/s in mind?	What level could it be used for?
1.				
2.				
3.				
4.				
5.				

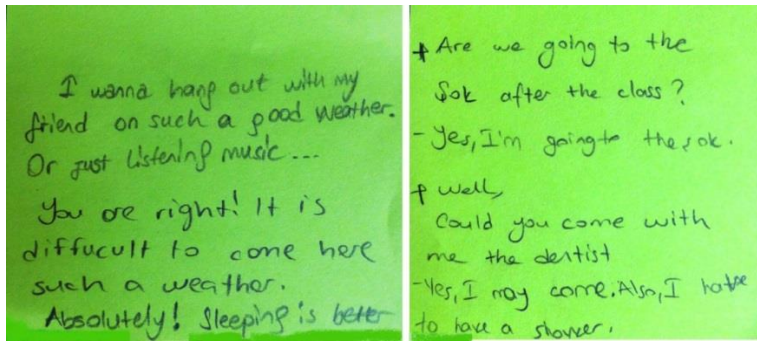

Some sample activities can be seen below:

Sample Activity: Response to a Newspaper Article

If one of the aims is "to be able to respond to an essay/an opinion," the teacher first brings enough samples of newspaper articles and responses. Then, the teacher gives a current newspaper article which is controversial, and asks students to write a reply to the article. Then, in a reading circle students can read each other's or send it to the newspaper.

Sample Activity: Writing Notes to Each Other

If one of the aims is "to be able to write notes," the teacher expresses one rule: 'NO TALKING.' The students are free and they can communicate by writing notes to each other in English. The teacher can provide the note cards or they can write on any piece of a paper. The teacher assures students that s/he will not read them but check if they are written in English or not from a distance. In this activity if the students know each other well, they write faster with more enthusiasm than they show in other activities. Some samples are below. Furthermore, more formal notes should be provided later.

PROCESS AND PRODUCT WRITING

While teaching writing to students, teachers can focus on the product and process of writing. The aim and the task type determine the proper approach of writing.

In the product approach to writing, teachers are interested in the product only, not the process. Students write a text and teachers assess it. Teachers are not involved in the actual writing process and the feedback is given after the task, not during the process. For example, in an exam, students write essays and teachers assess only the product. Another example is students write one-sentence answers for a reading text or one-word answer for a gap-filling exercise. If there is limited time for the activity, teachers can prefer it. Moreover, students need to be trained to perform in time limits, making use of the time better as we do not always have a lot of time for writing in real life.

However, in the process approach to writing, the teacher and peers are more involved during the writing process and constant feedback is given. Constructive feedback given during the actual process of writing contributes more to the language leaning than product based writing although it takes time. In the process approach to writing, the teacher is involved in the writing process and guide students during the stages of writing: pre-writing (choosing a topic, narrowing down the topic, brainstorming, writing freely, discussion), planning (outlining), writing the first draft, getting feedback (from the teacher or peers), editing and revising, rewriting which is writing the final product. This is a circular process. The process may also include research, discussion, and data gathering. It takes time and requires effort by both the teachers and the students, but the final product is something to be proud of. One example to the process writing activity is that students write essays in class and should be provided with enough guidance. It is usually not possible to write a text properly at one-time-sitting in class. Students first choose a topic or given the topic and they are allowed to think, discuss and research. Then they write the outline and first draft of the essay. Next, students can give feedback on each other's essays that is peer feedback about content, ambiguous parts. After the students have revised it again, they write the second draft and hand it to the teacher. The teachers comments on the essays and identifies mistakes and points to be improved. So after the students get them, the teacher can provide oral feedback, too. Finally, the students write the final draft of the essay which becomes a very effective one. Moreover, students can be asked to type them, so they become 'computer literate', too, which means "comfort and fluency in using hardware and software." (Warschuer, 2002) Most can

type well but do not know how to use word processing effectively. So asking to type helps them become computer literate.

Some teachers argue that product approach is better as it is easy and time saving for the teacher, but the issue is how much it helps learners improve writing. Teachers should focus on student learning. When teachers prefer product approach for a task that actually requires process approach, students write, teachers correct and if necessary grade them. After students get the corrected versions, what happens? They usually have a quick look at them and put them in a book or even make balls or planes with them to throw and therefore forget about them, which is quite upsetting for the teachers to see the result after they have spent a lot of time correcting them. As Brown (2006) stated that to come up with a perfect final product without the above process may cause “writer’s cramp” and feel anxious as they feel the pressure “to write an in class essay that would be judged by the teacher, graded and returned with no chance for future revision.” However, when they are given another chance to improve their writing, they will come with better ones. Moreover, they will get higher marks for the improved versions of their writing tasks- final drafts- leading to more motivation to write more.

CREATIVE WRITING

Creative writing includes imaginative writing activities such as writing stories, poems, plays and cartoons. Such activities give a sense of achievement to the students and “most people feel pride in their work and want it to be read.” (Ur, 1996) Students are more engaged and try to produce more appropriate language than any other activities. They put their abilities and experiences into the work; therefore have more motivation to find the best language to express themselves (Harmer, 2007).

Moreover, in order to provide readership, the written works can be read by other peers, included in class magazine or posted on walls. If the class or the school has a website, they can be published there to reach more audience.

One problem during creative tasks can be student negative reaction stating “difficult” or “having nothing to say.” One solution may be starting bit by bit rather than expecting a long task. The more important one is providing enough courage to do the activity. Students should not feel their abilities are tested or the fear of assessment and failure.

Activity: Analyze the activities below according to the Table 1. Think of different versions of the activities. Then, find more creative activities in your groups for different ages and levels of learners.

1. Story writing: The teacher gives the first sentence of the story and each student in the class write the same sentence as the beginning of the story. Then, the students respectively add one more sentence to each other's story. So students need to read the previous sentences and add one more. After the circle is completed, students read aloud the stories. This activity can also be done as a group work activity depending on the number of students in the class. The first sentence can be as followed:

One day, the old man heard a loud noise in the garden.... OR

Suddenly the little boy fell down the tree and the man saw him.... OR

Yesterday at school an 13-year-old boy fell down the stairs. Fortunately...

2. Writing a dialogue between an animal and a human being: Students in pairs are asked to write a short dialogue between an animal and a human being. The dialogue can be between an ant, a chicken, a cow, a bull and a man. Places can be given to help them if needed such as the dialogue between a bull and a man during the carnival in Brazil or between an ant and a man in the park. Students can decide which animal to write about. A sample is below:

The ant: Hey!! You are stepping on my food.

The man: Oh, sorry! But you are everywhere.

The ant: YOU are everywhere.

The man: This is my way to home.

The ant: Next to my home! Can you give me some food?

The man: Sure. Take some bread. Your friend is climbing my shoe.

The ant: Hey body. Jump down. Quick!

The man: Thank you. I could have killed him.

3. Completing a cartoon: There are many websites available for making cartoons. The teacher has created a cartoon and asks students to write the dialogue in pairs. Students can also create their own cartoons, deciding on their scene and characters. Creativity makes them enthusiastic learners.

<http://www.toondoo.com/Home.do?param=log&msg=1>.

Activity: As a group write an acrostic poem about writing skill.

Sample poems can be seen below written by a university student aged 18.

Writing once
Requires thinking twice.
It is also hard
To make a good organization
In that context,
Neglect things making no sense
Good job, finally, it becomes.

Writing, spelling and punctuation,
Reading and of course researching...
In that university,
Things like these made us mad!
Incredible lessons, unbelievable profs
No comment and no complaint,
God see and help us graduate!

WRITING AND GENRE

In a genre approach, students analyze the text genre before they start writing in that genre. After exposure to enough samples and analyzing them, they write similar ones for the similar given tasks. To illustrate, if students are going to write formal e-mails, first the teacher provides them enough models of the e-mails so that the students really knows the format and the specific languages such as how to start or end. Then, their task relevant to their context is given and they are asked to write a formal e-mail. For example, they can e-mail to a teacher, to a chairman of a language school.

Sample Activity: Writing a Formal Email to the Teacher

If one of the aims is “to be able to write/reply to a formal e-mail,” the teacher can show some sample formal and informal e-mails, and make them analyze both types of e-mails. After the students have revised to write a formal e-mail, they can be asked to send a real e-mail to the teacher requesting information about the course or the assessment. Therefore, the teacher can really see whether they can write and send a proper e-mail. Some students may not have even an e-mail address. So they become computer and Internet literate, too via this activity.

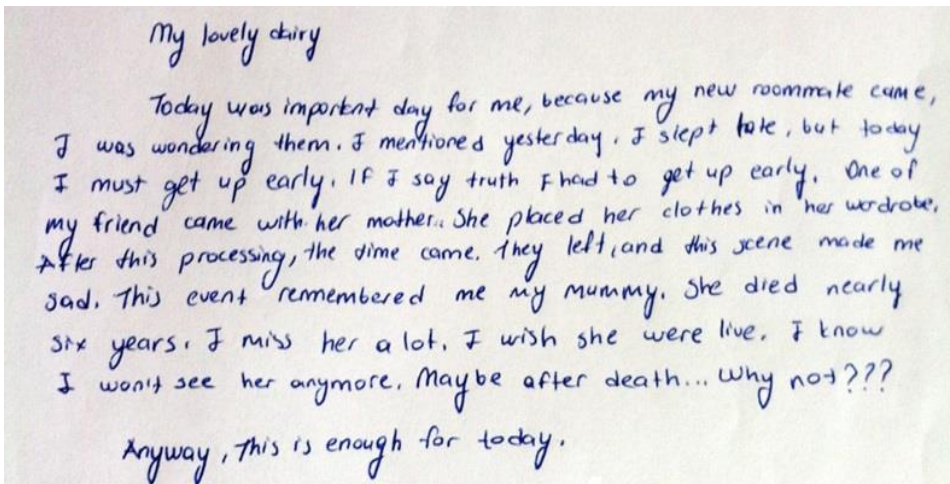

Sample Activity: Newspaper

Preparing a school or local newspaper has usually been a challenging activity for students. First of all, the students can analyze different newspapers and discuss what sections there should be in their newspapers such as articles, advertisements. The news can be local or global. Each section can be prepared in pairs or groups depending on the number of students and sections. Moreover, they can decide on a name and an editor/s can edit the sections. Later, they can be displayed in class or at school so other students can read, too.

HOW SHOULD TEACHERS GIVE FEEDBACK?

Activity: In English class, the teacher assigned learners to write journals for a week. Read the following journal written by a university student aged 18 living in a dormitory and answer the questions below with your friends.

1. What is the aim of the activity?
2. How would you give feedback on it?
3. What comment would you write on it?
4. Would you correct the mistakes? If yes, which ones and how?

Teachers leave the English class with a lot of writing assignments, thinking “How will I give feedback about them?” How you give feedback depends on the aim of the activity. For example, the aim for the activity above is to write about daily experiences on a journal so to be able to communicate or convey the message is important. Therefore, the teacher should not correct the language mistakes in this journal. The feelings are clear. The teacher can only respond it by adding a comment regarding her feelings. Moreover, if the aim is only to write about past experiences in A2 level, only past tense usage can be corrected. One problem with journal writing can be the writer’s block, which means “nothing to say.” In order to prevent it, learners may be given a specific topic such as writing about a memory when they felt embarrassed for B1 learners or describing an important person in their life for A2 learners.

Constructive feedback should absolutely be given rather than just correcting and saying “Rewrite please.” Teachers should write not only negative but also positive comments on students’ written work. Otherwise, one can easily imagine what students feel when they see a paper full of red markings and negative comment. They would never want to write again. Students wonder the comments the teacher have made on the paper rather than the corrections and compare the comments on each other’s papers. Another way to give feedback is mini student conferences. Teachers can get together in class if they have time or out of class and talk about the feedback. So students have a chance to ask questions to teachers. Furthermore, teachers can also talk about common mistakes and comments in class together. Common

mistakes can be shown on the board or one student writing can be corrected and commented together without revealing the student's name.

While correcting students' writing, the teachers can ask themselves "Should I correct every mistake?" The answer depends on the aim of the task and the level of the students. For example, if the aim of the activity is to be able to write about one's daily activities in the past, the teachers should correct mistakes about the use of past tense, verb forms. A correction about the use of articles which is not the focus of the activity or use of relative clauses which has not been taught in class but students only have dared to use can be demotivating. So as Harmer (2007) states teachers should be selective when correcting, which he defines as 'selective marking.' Teachers should avoid 'overcorrection' which leads to the discouragement of the students, especially students at lower levels. Ur (1996) states if teachers correct mainly the language, they convey "the implicit message that these are what matters." However, some students can ask for detailed correction, then their writing can be corrected a bit more. Teachers can decide it only by observing the students well. To sum up, as Ur (1996) states teachers have the "potential conflict between language instruction versus encouragement of learning," but correction should not hinder learning.

Another question is "How should I correct mistakes?" Teachers can identify and write the corrected version of mistakes, can just underline mistakes or use correction symbols to show mistakes.

When teachers usually hand back the written works with the corrections, low level learners can make use of it much. But what do the students usually do? Do they read it again carefully and learn the correct forms? Unfortunately, the answer is usually no. They have a quick look at it, see the number of corrections and put it away, sometimes between pages of a book to be lost or use later as drawing paper. Alternatively, when teachers just identify the mistakes by just underlining or marking with correction symbols and ask students to correct the mistakes themselves or with their peers, students care about them more. This is also a process of awareness raising of the mistakes for the students. They may not be aware that they have made a mistake. Students put great effort while trying to correct them. They look up dictionaries, search grammar books or ask for help from their peers. Moreover, if the teachers grade them after student corrections, that is final drafts, then their effort worth seeing.

Teachers can correct the mistakes in different ways as seen below. In the first one, teachers correct the mistakes themselves and can be used with students at very low levels of English. In the second one, teachers show the mistakes by using correction symbols and ask students to correct them. In the third one, teachers just underline the mistakes without identifying the kind of mistake and students correct. It can be used with upper levels learners of English.

Use of correction symbols provides an opportunity to reconstruct the language. A short list can be seen below. Teachers can come up with more symbols as long as it is studied in class with the students. The teacher can bring a poor text and students can correct it using the symbols.

Correction Symbol	Meaning	Student sentence	Corrected version
sp	Spelling	I love wrting.	I love writing.
cap	Capitalization	On monday we went home late.	On Monday we went home late.
Wf	Wrong form	He answered it careful.	He answered it carefully.
wo	Word order	He bought cheap a book.	He bought a cheap book.
ww	Wrong word	The bell stole.	The bell rang.
^	Missing word	I going home now.	I am going home now.
frag	Fragment	When I came here.	When I came here, I saw him.
?	Not understood	When sports I?	Student correction
p	Punctuation	He said Hello.	He said, "Hello."

Peer feedback is also invaluable for the teachers for feedback giving. Learners learn from each other a lot and opportunities should be provided. Teacher shouldn't be the only reader and guide. Even one single sentence can be checked by their peers. After they have written a piece of work, they read each other's and give feedback on them such as effective points, parts that is not understood or need clarification. Students should be well informed of peer feedback. Guidelines which are prepared by the teacher according to the activity can be provided in class as photocopies or written on board. The expectations of the teacher should be clear for the students. An example of peer feedback can be done by the teacher as a demonstration by projecting a sample on the board. After they have analyzed a work together, they will be clearer about the expectations. While giving feedback, students can focus on content or both content and form, depending on the activity. However, it is usually more effective for students to focus on content because if it is not appropriate with their levels, students can correct a language mistake in a wrong way or try to correct the already correct one resulting in an another mistake. Therefore, the other students complain to the teacher about wrong corrections of grammatical forms. The social atmosphere of the class may also affect the appropriateness of peer checking. Some students can be content to find others mistakes which lead to humiliation.

Sample Activity: Peer Editing on an Academic Paragraph on Topics of Interest

In an academic writing class, after the teacher have presented how to write an academic paragraph, how to give feedback, the use of correction symbols, students are given a sample student paragraph and asked to edit it. Peer editing checklist is also provided. It can be done as an individual or a pair activity. Afterwards, students can be asked to rewrite it. They may

also write their own paragraphs, peer edit them in class, rewrite and submit them to the teacher. The teacher can provide different checklists for different activities or write some guiding questions on the board.

There are three reasons why I love learning English. The first one is that you are free to choose the place you want to study. You don't have to sit at a table and carry heavy books with you. You can revise your vocabulary cards in a bus or listen to music repeating the lyrics lying on bed. The second reason is that it requires real communication if we want to improve our English. Finally, I love reading a lot and my leisure time activity improves my English. I read a lot of short stories. My brother really loves reading, too. To sum up, I love learning English.

Peer Feedback Checklist

1. Is the format appropriate? Write a comment about it.
It looks good, yet you should remember to write a title and indent the first line.
2. Underline the words or sentences you would like to comment on. "real communication" Can you explain it more, please. I couldn't understand what you mean exactly.
3. Does it have a proper topic sentence?
Yes. Your topic sentence. It is clear
4. How many supporting details are there? Have they been explained enough?
There are 3. All start with a transition. You can explain the second reason better. Can you give examples of situations where real communication takes place?
5. Is the paragraph coherent?
Your paragraph is about you, but you have written a sentence about your brother. It seems irrelevant. In addition, you used two subjects 'I and You.' You can prefer one.
6. Is there a good conclusion sentence?
You have remembered to write a conclusion sentence but I think you can make it stronger. It is very similar to your topic sentence.
7. Check the paragraph for punctuation, capitalization and spelling.
I could not see any mistake about them. You are very good.
8. What do you like about this paragraph?
This is a good paragraph. I could understand the content well and it is not confusing for the reader.

HOMEWORK OR IN-CLASS WRITING?

Teachers of English have a lot of time limit in class and following a curriculum, and have difficulty in deciding whether writing should take place in class or outside.

When there is time limit and a curriculum to catch up with, it is difficult so writing can be given as homework or as Thornbury (2012) defines "out-of-class work or 'between-class' work." He (2012) also adds

"What happens between lessons is as important – or more important – than what happens in them. Think of the classroom as a kind of 'pit stop' where learners come in to be re-fuelled and change their tyres. The real action is happening outside."

However, when teachers let them write at home, other problems occur. They get help from different sources. How much help from whom is acceptable? Students can get help from other peers, internet and people with higher levels of English and may not call it plagiarism. Students should be informed of plagiarism beforehand. Citation rules should be taught briefly at least. Internet can facilitate plagiarism as it provides millions of texts for copying and pasting but also offers teachers chances to check for plagiarism via search engines or special plagiarism checking software (Warschauer, 2007). On the other hand, all writing shouldn't be left home. During the process of writing, teachers themselves should also be ready for students who seek help. Writing in groups, peer feedback on writing texts are examples of valuable activities. (Wharton & Race, 1999)

WHAT ARE THE ASSESSMENT CRITERIA?

Assessment criteria should be decided before students write their texts and should be discussed and studied together in class so that students are aware of teachers' expectations from their writing. According to the criteria they can assess their own writing before submission, so the final work and the grade will not be a surprise. The teacher can focus on the content or the form, however there should be a 'fair balance between content and the form' in the criteria. (Ur, 1996) The criteria depend on the aim of the task and the level of students.

The aim of the task can be to practice a grammatical structure use or write an opinion essay, etc. If the writing task is one sentence answer to a comprehension question in a reading exam, the focus should be on meaning that doesn't require any loss of points for grammatical or spelling mistakes as long as it conveys the intended message. If the aim of the task is to test the use of a grammatical structure, the type of mistake determines the loss of points. For example, if the student wrote "I went to the library yesterday," the student should not lose any point for misspelling 'library.' Unfortunately when students get no points for a similar spelling mistake, it leads to the demotivation of the students for getting low marks very often. Similarly, if students are required to write dairies to improve writing for a long period of time, as long as the message is conveyed, no correction should be made and should not cause loss points.

The level of students is the most important factor to determine teachers' expectations. When the teachers' expectations exceed the level of the students, it is inevitable for the students to get lower marks. According to the level of the students, the top bands should be decided reasonably and Common European Framework (CEF) provides descriptors for writing competences at each of its six levels and provides criteria for assessing the learners' abilities. The CEF distinguishes between written production and written interaction. The descriptors for overall written production at all levels are given below in the form of "can do" statements. Written production also includes descriptors about creative writing; reports and essays. Written interaction includes correspondence, and notes, messages and forms.

	Overall Written Production
C2	Can write clear, smoothly flowing, complex texts in an appropriate and effective style and a logical structure which helps the reader to find significant points.
C1	Can write clear, well-structured texts of complex subjects, underlining the relevant salient issues, expanding and supporting points of view at some length with subsidiary points, reasons and relevant examples, and rounding off with an appropriate conclusion.
B2	Can write clear, detailed texts on a variety of subjects related to his/her field of interest, synthesizing and evaluating information and arguments from a number of sources.
B1	Can write straightforward connected texts on a range of familiar subjects within his field of interest, by linking a series of shorter discrete elements into a linear sequence.
A2	Can write a series of simple phrases and sentences linked with simple connectors like 'and', 'but' and 'because'.
A1	Can write simple isolated phrases and sentences.

(CEF, 2001 p.61)

To give more examples, according to CEF (2001, p.62) independent user threshold that is B1 students “Can write short, simple essays on topics of interest,” and B2 students “Can write an essay or report which develops an argument systematically with appropriate highlighting of significant points and relevant supporting detail.” Therefore, one cannot expect B1 level students to write a detailed argumentative essay. Moreover, when CEF is checked for grammatical accuracy reference tables, top band for B1 level students is “Communicates with reasonable accuracy in familiar contexts; generally good control though with noticeable mother tongue influence. Errors occur, but it is clear what he/she is trying to express.” (CEF, 2001 p.114) So students at B1 level should not lose points for every grammar mistake. Another example is that A2 level learner “Uses some simple structures correctly, but still systematically makes basic mistakes – for example tends to mix up tenses and forget to mark agreement; nevertheless, it is usually clear what he/she is trying to say,” (CEF, 2001 p.114) which means teacher cannot expect total accuracy in writing texts.

Teachers can use holistic or analytic rubrics while assessing and grading a piece of writing. Holistic rubrics give a broad band of grading and overall impression of the written work. It is usually easier for experienced teachers to use as there is a single score. However, if there are a lot of texts from different classes to be assessed by multiple assessors, to sustain a reasonable objectivity, analytic rubrics are preferred. Separate scores are given for different aspects of the written work such as content or task achievement, language (range and accuracy of language structures and vocabulary), coherence and mechanics which include format, spelling, punctuation and capitalization. Points for each band can be decided by teachers unanimously. Rubrics should be shared and discussed with students beforehand.

Another option for teachers to assess writing texts is ‘automated writing evaluation software’ and their use has increased since the digital age begun. They provide holistic or analytical scoring. They are used in standardized tests and classroom instruction (Warschauer, 2007)

Students can keep their writings in a file called “portfolio” where they keep all kinds of tasks they have done in the English class including first and final drafts. Therefore, at the end of the term they see how much they have studied and progressed. It is a proof of the work

they have done. Teachers should set the aims of portfolio, plan and supervise it, and assess it in relation to valid and transparent criteria. Moreover, students can use it as “European Language Portfolio” when they need to prove their language level internationally.

MORE SAMPLE ACTIVITIES

Sample Activity: Preparing, Conducting and Reporting a Survey

The students can prepare their own questions in a survey on a given topic or a topic they can decide. Topics can be how much students are content with their school, what activities they have every day or opinions asking about their school life. The topic can be chosen according to the level and age of the students. Alternatively three question be given as guidance to students and they add three more questions. After they have decided the questions in the survey, they conduct it either in the class or at school. They should ask at least 15 to 20 people. Later, with the teachers’ guidance they should analyze the answers and write a short report about them. Moreover, they can make graphs related to the results so that they become computer literate.

How often	always	often	sometimes	rarely	never
do you go to the school library?					
do you eat in the cafeteria?					
do you go the cinema?					

Do you agree that students at university	I strongly agree	I agree	I disagree	I strongly disagree
should pay tuition?				
should attend all classes?				
work?				

Sample Activity: Extensive Reading Project

After the teacher have explained the importance of extensive reading to improve English, the teacher asks student to choose any book that they would like to enjoy reading. It is important that students choose their own books for pleasure in the given time, probably two weeks. Then the teacher may provide a time table for reading them. The students are asked to bring it to the class and read in the class time to time, complete the given writing tasks and display them on poster in the class. The content can be changed according to the level and age of the students.

- Week 1&2: Find the books. Give a short presentation about the book (the name of the book, the writer, why s/he has chosen that book, etc.)
- Week 3&4: Read and write a short description about the characters.
- Week 5&6: Read. Write a dialogue which is not directly in the book between two characters.
- Week 7&8: Read. Write a letter to one of the characters in the book.
- Week 9&10: Read. Write your own end of the book.
- Week 11&12: Finish reading. Write a summary. / Write a letter to the author.

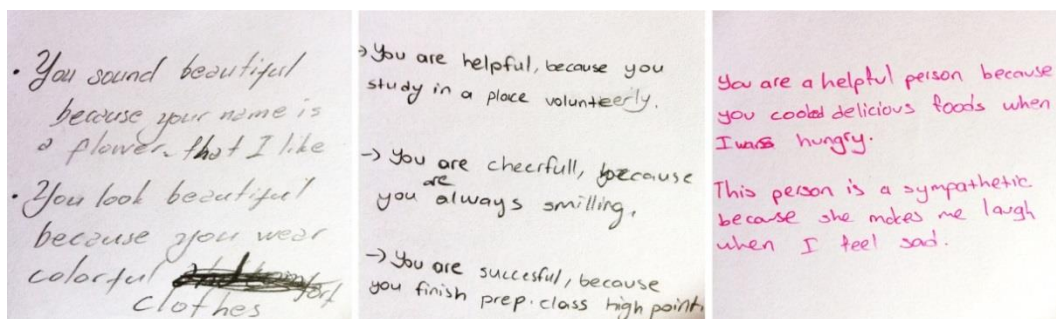

Sample Activity: Sentence Completion

The teacher gives half sentences and the students complete them. After they have completed, they may compare their answers and the best answers can be read aloud in class.

- If I had ten brothers, ...
- If I had four arms, ...
- If I had 30 hours in a day, ...
- I wish I could ...
- I wish I was ...

Sample Activity: Complementing Each Other

After the students have learnt or revised personality adjectives, they are asked to write two or three complements to someone they choose in the class without stating the name of that person. They can be asked to write reasons, too. This activity also contributes to building positive atmosphere in the class. After they have written, the cards are read aloud and students try to find out for who they have been written. Samples can be seen below.

Sample Lesson Plan

Students' age: 17

Students' level of English: A2

Aims of the lesson: At the end of the lesson, students will be able to write an informal e-mail, to describe cities briefly, to plan activities.

Target language: E-mail opening and closing, the modal 'can,' 'There is/are'

ESA Stage	Approx Time	Aim	Teacher Activity	Student Activity	Interaction	Materials
Engage	1-2 min	To arouse interest	T shows students(ss) some photos of a country and asks which country it is. Then asks ss match the photos to the cities written on the board. (Hollywood, Washington, Florida)	Guess match	Lockstep	Photos Board (B)
Engage	4	To awaken background knowledge	T asks what they remember about them and can do there. T writes on B: "In Hollywood you can see film studios." Target language: Revision of 'can, there is/are'	Write sentences	Pairs	
Study	3	To elicit the content	T explains that a student from the USA has sent an email to a friend and they are making plans for the summer holiday. T writes questions on the B. Then, T elicits answers. 1. Which cities does John want to go? 2. Why does John want to visit those cities? 3. How long is he planning to stay in each city? 4. "I8r, C u"?	Read the e-mail and answer the questions. Then, check answers with their pairs.	Individual Pairs	Copy of the e-mail
Study	3	To elicit the content	T tells the other friend has sent a reply. T asks 1. Does Tom want to go to these cities? 2. When does Tom want to go? 3. How long does he want to stay in each city?	Read the e-mail and answer the questions.	pairs	Copy of the e-mail
Study	3-5	To analyze informal e-mail	T asks some concept check questions about informal e-mail format. 1. How does he start the e-mail? 2. What is each paragraph about? 3. What transitions are used in the plan? 4. What grammar structure is used to talk about plans? 5. How does he end the e-mail?	Answer voluntarily.	Pair	

ESA Stage	Approx Time	Aim	Teacher Activity	Student Activity	Interaction	Materials
Activate	10-15	To write an informal e-mail.	T tells students “You are planning to go on holiday in August with one of your friends in Turkey. You want to visit different cities. Write an e-mail about which cities you would like to visit and explain the reasons.” While ss are writing, T is available for help around the class.	Write individually.	Individual	Some paper
Study	7-10	To give peer feedback on informal e-mails To raise awareness of the informal mail.	T asks ss to read each other’s mail and give peer-feedback on them. T writes guiding questions on the board. A demonstration can be done by the T. next, T monitors ss. -Did s/he start with an opening and a closing remark? -Can you find the reasons to visit each city easily? -Underline the words/sentences that you do not understand.	Read each other’s e-mails and writes feedback on them.	Pairs	
Activate	3-5	To revise and edit the e-mail.	T instructs ss to revise and edit their own e-mails.	Revise & edit e-mails. Rewrite if required.	Ind.	
Activate	10	To reply to an informal e-mail.	T instructs ss to write a reply to the other friend’s e-mail.	Write a reply to the e-mail.	Ind.	
Study	5	To give peer feedback on informal e-mails.	T asks ss to read each other’s reply and give peer-feedback on them. (Peer feedback and reply should be written by different ss.)	Read each other’s replies and writes feedback on them.	Ind Pair	
Study	3-5	To revise and edit a reply to an e-mail.	T instructs ss to revise and edit their own e-mails.	Revise & edit e-mails. Rewrite if required.	Ind.	
Study	3	To reflect on achievements	T collects all e-mails for further feedback. Then, T asks ss to report back about what they have learnt today, what they can do.(I can write a good informal e-mail.) T can ask some ss about their holiday plan mentioned in the e-mails.	Ss answer and talk about their plans.	Lockstep	

E-mails for the Sample Lesson Plan

From: John
To: Tom
Subject: Holiday

Hello Tom,

How are you? I hope you are fine. I am writing to you about our holiday in July.

I have done some research and chosen three cities to visit in the USA. I think we should visit Hollywood, Washington and Florida. First, we can go to Hollywood. There are a lot of film studios there. I hope we can visit Universal Studios there. We can stay for two days. Then, we can go to Washington for two days. We should see the White House. Finally, we can go to Florida. There are a lot of nice beaches there. We can swim there. We can stay for three days in a cheap hotel.

I hope you want to visit these cities, too. I am looking forward to your opinion about the holiday plan

See you.
John

From: Tom
To: John
Subject: Re; Holiday

Hi John,

I am happy to hear about your holiday plan. I want to visit these cities, too. But I think we should spend three days in Hollywood and two days in Florida. In Hollywood there are a lot of activities to do. Two days will not be enough.

We can go on holiday on 3rd of June after the school has closed. Is it OK for you? If so, we can buy the plane tickets.

I am looking forward to your answer.

Call you l8r. C u.
Tom

CONCLUSION

Writing is an indispensable part of language teaching. Enough time and effort should be allocated to improve learners writing skills, therefore, overall language skills. The writing activities should be meaningful, authentic, having readership and appropriate for students' levels. Process and product writing approaches should be applied according to the aim of the lesson. During the process of writing teacher and peer feedback is invaluable for learners and peer feedback should be encouraged. For teachers, giving feedback may seem difficult but we should always remember the benefit for the learners. We should avoid overcorrection and

focus on selective marking. Moreover, creative writing activities bring humor to class and lead the sense of achievement and pride for the learner. About assessment, we do not have to assess every single piece of writing, however when there is need to assess, we should have valid transparent criteria that is discussed with the students.

For students undergoing teacher education The European Portfolio for Student Teachers of Languages (EPOSTL) is a helpful document. It aims to encourage student teachers to reflect on the didactic knowledge and skills necessary to teach languages, help them to assess their competences, monitor their progress and to record their experiences of teaching during the course. (Newby, Allan, Fenner, Jones, Komorowska & Soghikyan, 2007)

Below you can see the self-assessment, which contains lists of ‘can-do’ descriptors about writing and written interaction. Read them and write your reflections in the space provided.

Writing/Written Interaction	Your reflection
1. I can evaluate and select meaningful activities to encourage learners to develop their creative potential.	
2. I can evaluate and select a range of meaningful writing activities to help learners become aware of and use appropriate language for different text types (letters, stories, reports etc).	
3. I can evaluate and select texts in a variety of text types to function as good examples for the learners’ writing.	
4. I can evaluate and select a variety of materials to stimulate writing (authentic materials, visual aids etc.).	
5. I can evaluate and select activities which help learners to participate in written exchanges (emails, job applications etc.) and to initiate or respond to texts appropriately.	
6. I can help learners to gather and share information for their writing tasks.	
7. I can help learners to plan and structure written texts (e.g., by using mind maps, outlines etc.).	
8. I can help learners to monitor, reflect on, edit and improve their own writing.	
9. I can use peer-assessment and feedback to assist the writing process.	
10. I can use a variety of techniques to help learners to develop awareness of the structure, coherence and cohesion of a text and produce texts accordingly.	
11. I can evaluate and select a variety of techniques to make learners aware of and use spelling patterns and irregular spelling.	
12. I can evaluate and select writing activities to consolidate learning (grammar, vocabulary, spelling etc.).

Chapter 64

TEACHING READING IN EFL CLASSES

Mehmet Bardakçı¹ and Kadriye Dilek Akpınar²

¹Gaziantep University, Faculty of Education,
English Language Teaching Department, Gaziantep, Turkey

²Gazi University, Faculty of Education,
English Language Teaching Department, Ankara, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. list the basic skills in reading.
2. list the difficulties in reading in EFL context.
3. list reading sub-skills.
4. define intensive and extensive reading.
5. differentiate between facts and opinions.
6. recognise an argument in a written text and name its parts.
7. evaluate an argument and analyse a text critically.

STUDY QUESTIONS

1. What are the four strands of reading?
2. What part of the passage do you pay most attention to while reading?
3. What do you think are the differences between reading in native language and reading in foreign language?
4. What do you think an argument means in reading?

INTRODUCTION

Language is an important means of communication. People learn how to convey and share the meanings of things through language (Halliday, 1993). The relationship between second/foreign language acquisition and communication can be best explained by Halliday's language-based theory of learning principal. According to Halliday all learning is a linguistic process and consists of three interwoven language functions: learning language, learning content through language, and learning about language.

As a complicated system language includes "small elements that can be combined in an infinite number of ways in order to make larger structures" (Lems, Miller & Soro, 2010, p.3). The four dynamics of language are phonology, morphology, syntax, and semantics. The phonology is the sound system of a language and a set of rules that control how they can be combined. In other words, it is the audible quality of language. Morphology is the forms of words, and the ways these forms of words are related to other words. Syntax is the rules for the formation of sentences and phrases in which words can be combined. Finally, the semantics is the study of meaning in language. It includes the meanings that emerge from all of the previous three elements: the sounds, word meanings, and word-order patterns. Phonology, morphology, syntax, and semantics exist in all languages. However, a writing system, or orthography may not exist in every language. The other four universals of language (phonology, morphology, syntax and semantics) are naturally acquired by native speakers of a language. On the other hand, orthography is not naturally acquired and needs to be taught since it is related to literacy (Peregoy & Boyle, 2005, p. 164). Pinker (2007) supports this claim by stating that, "Language is an instinct, but reading is not" (p. 14).

In language learning there are four skills that learners need for complete communication: listening, speaking, reading, and writing (Canale & Swain, 1980). In the first or native language, people have all these skills and background knowledge that is needed to communicate. So, they are probably not aware of the complexity of the process. However, in second/foreign language acquisition the four skills represent a particular pattern. Though they are stated in the same order with first language, generally listening and reading are characterized as "receptive," and speaking and writing as "productive". However, we should be cautious in drawing precise lines between them "because they fail to capture the active meaning making that takes place during both listening and reading" (Lems et.al, 2010, p.5). The four skills need to be included in the Foreign Language (FL)/ Second Language (SL) curricula both for instructional planning and assessment. Thus, this chapter particularly focuses on reading skill in foreign language learning.

HOW READING IN NATIVE LANGUAGE DIFFERS FROM READING IN FL

Reading is an interactive and complex process (Birch, 2007; Rumelhart, 1980). The major goal of reading is to make sense of the text rather than just to decode the words in the text (Adams, 1990; Blachowicz & Ogle, 2001; Goodman, 1970 and Wagoner, 1983). Koda (2007) supports this by stating that the aim of reading is "to construct text meaning based on

visually encoded information” (p.1) which takes place between the text and the reader’s processing strategies and background knowledge.

First or native and FL reading have different processes for the readers for Carrell and Grabe (2002), since:

- FL readers is limited in their linguistic knowledge;
- they do not have adequate cultural and social knowledge that takes place in the target language context;
- they do not have background knowledge, which makes sense of the reading material.
- they learn a FL for various purposes such as visiting, staying or working in the countries where the target language is spoken.
- they have to use both their native language and FL. (Carrell & Grabe, 2002).

Therefore, it is more challenging to read in FL than reading in first or native language (Koda, 2007), which requires a special instruction of strategies.

READING COMPREHENSION

Reading comprehension refers to forming the meaning of the oral or written messages. Readers construct these messages by using “bottom-up” and “top-down” approaches (Stanovich, 1980). Bottom-up approach is a mastery of a set of word-level skills such as letters, sounds, syllables, words, phrases, sentences, and paragraphs. Meaning construction process begins with smaller parts of the texts, which results not getting the whole meaning yet it allows the reader to be able to decode connected text.

Different than bottom-up approach, top-down approach refers to the analytical and cognitive skills that are needed for comprehension. Readers focus on the whole text passage (global meaning) by making connection with prior knowledge, rather than just relying on words to comprehend the text.

Lems, Miller & Soro (2010, p.230) summarizes the two approaches by stating that “bottom-up skills refer to the word-level skills that are required for decoding and top-down skills refer to the analytical and cognitive skills that are needed for comprehension”. They add that both skills interact and overlap for “making many rapid judgments about words and keeping the words in working memory as we form reasonable interpretations about possible meanings” (Lems et.al, 2010, p.33).

DIFFICULTIES ENCOUNTERED BY EFL READERS WHEN THEY ARE READING

Schema Related Difficulties

Koda (2007) defines schemata, background knowledge, as “generalized information abstracted from a variety of instances” (p. 1). Depending on the studies of several researchers (Hudson, 2007), there is a direct relationship between schemata and reading comprehension.

For example, readers who have background knowledge about the topic of a text can understand the reading material better than the readers who do not have prior information of the topic. Generally, topics related to the target culture require a familiarity for the EFL readers to comprehend and decode the reading text as well as English-speaking readers (Jiménez, García, & Pearson, 1996).

In her study, comparing the cultural differences between L1 and L2 reading, Singhal (1998) focused on the variables such as content/background schema, formal/textual schema, and linguistic/language schema. Her findings revealed that L2 readers, without cultural background knowledge about an English text, have difficulty in comprehending the text message. She also claims that text structures differ depending on the language. As for the formal/textual schema, she emphasizes the importance of the familiarity of the language structure on understanding the reading material in terms of finding the clues of “cause and effect”, “question and answer”, and “compare and contrast”. Finally, she asserts that linguistic/language schema is also effective on the readers’ interpretation of the text. According to Singhal (1998), linguistic features of L1 may have an affect on the comprehension of an English text.

Vocabulary Related Difficulties

English language learners’ limited vocabulary is one of the most important problems they encounter particularly while they are reading (García, 2003). Readers need to develop their English vocabulary capacity in depth and width since vocabulary capacity is intertwined with reading comprehension (Hudson, 2007).

Most of the difficulties are due to the certain words in the English language that can have more than one meaning. They can be confusing for the learners if they do not take into account the contextual meaning of the word. One example is the word of “fall”. “Fall” in the following sentence, “I can fall with all this water!” means to descend to the ground. The same word in another sentence, “I had a fall at school” indicates failure in an exam. On the other hand, in the sentence, “Fall (Am. Eng.) is nice in the US,” “fall” means season of autumn.

Moreover, many English words were derived from other languages, such as Greek and Latin and have irregular rules in affixes. Affixes include prefixes (e.g., pre-, fore-) and suffixes (e.g., -ship, -ing, or -ese). They generally help English language learners to infer the meaning of unknown words. However, there are some exceptions that may confuse them. For example, “in- (or il-, im-, or ir-)” refers to “not” or “the opposite of something.” “Impolite” is the opposite of polite whereas “indifferent” is not the opposite of different. Therefore, English language learners, need to pay attention on each word since they may not always fit the rules of affixes.

First Language Related Difficulties

Reading in the first and second/foreign language has different processes (Carrell & Grabe, 2002). Especially low proficiency English learners translate the English text into their first language. Upton (1997), for instance, studied on two groups of (advanced and less advanced) adult Japanese students studying in an American University. They were asked to

think-aloud while reading an English expository text and allowed to use both Japanese and English during the comprehension process. Tape recorded think-alouds indicate that less advanced students used more Japanese language than the advanced students while reading. Though the less advanced group depended on the translation to confirm the meaning of the English passage and to decode the unfamiliar vocabulary, most of the advanced students focused on the content of the passage instead of translation. In other words, the advanced learners used the top-down skills, such as focusing on the whole text depending on the background information, whereas less advanced learners tended to focus on the bottom-up approaches, including smaller units such as vocabulary and grammatical structure.

The findings of Upton's (1997) study were in line with the findings found out by Anderson (1991) and Carrell (1989). They claim that, overuse of the bottom-up approach which readers try to translate all unfamiliar words into their first language, may cause the danger of misunderstanding the text.

PRINCIPLES FOR TEACHING READING

Nation (2009) offers some principles to design a reading instruction and practice programme.

Meaning-Focused Input

Reading instruction should cover various sorts of components since there are several purposes of reading. The objectives of reading can be listed as: to search for information (including skimming and scanning), to learn, for fun, to integrate information, to critique texts, and to write. In order to fulfill these aims teachers should be aware of the learner variables such as language proficiency level, personal, social and motivational differences. Reading materials should be selected and appropriately used regarding these learner variables.

Finally, the critical role of word recognition in reading should also be taken into consideration. For a full comprehension of a text "learners should read with 98 percent coverage of the vocabulary in the text so that they can learn the remaining 2 percent by inferencing from context". Nation (2009, p.6)

Meaning-Focused Output

Output hypothesis was emerged as a reaction to Krashen's input hypothesis and conveyed the "inadequacy of the input hypothesis" in terms of "explaining the effects of immersion education" (Nation, 2007, p.5). "The opportunities that output provides for learning however are not exactly the same as those provided by input" (Nation, 2007). According to Nation, output compensates the inadequacy of input by deliberately focusing on language features. According to meaning-focused output, language development means the development of the four skills. Reading should include other language skills. Therefore, a reading course should involve listening, speaking and writing activities related to the reading (Simcock, 1993; Nation, 2009).

Language-Focused Learning

Effective reading covers developing language skills and sub-skills and the language features including phonemic awareness, activities, phonics, spelling practice, vocabulary learning, using word cards, and grammar study (Nation, 2009). Some of this can be done through intensive reading and for improving these skills and sub-skills diverse reading strategies should be emphasized in FL classroom. These strategies were described by several researchers (Janzen & Stoller, 1998 and García, 2003) such as previewing, setting a purpose, self-questioning, making inferences, associating prior information, concerning text structure, criticizing and reflecting on the text.

Selection of the reading material is also important to achieve English language learners' reading outcomes. A range of text types, such as narrative text, expository text, descriptive text and literary text should be used for different purposes based upon students' needs and lesson objectives. Learners should also be assisted to analyze, synthesize, and critically evaluate the text.

Fluency Development

Developing fluency in reading depends on the familiarity of the reading material that does not include any unknown language features. Thus, speed reading practice is necessary both for word recognition and for reading for comprehension. Skimming and scanning, speed reading, repeated reading and paired reading activities are suggested by Nation (2007) for the fluency development. All these procedures are necessary for developing fluency in reading.

Table 1. Techniques and activities for teaching reading by Nation (2009)

The four strands	Activities and techniques
Meaning focused input	Reading graded readers, Listening to stories, Communication activities
Language focused learning	Direct teaching of vocabulary, Direct learning, Intensive reading, Training in vocabulary strategies
Meaning focused output	Communication activities with written input, Prepared writing, Linked skills
Fluency development	Reading easy graded readers, Repeated reading, Speed reading, Listening to easy input, 4/3/2, Rehearsed tasks, 10 minute writing, Linked skills

Another factor influencing fluency is the motivation of the readers. Learners' interests regarding their age, sex and other characteristic features should be taken into consideration to motivate them. Instead of boring and demotivating texts, interesting texts should be selected. They can be supported with various activities like storytelling, independent reading, and shared reading. Finally, habit of reading should be developed by monitoring and encouraging EFL readers through the use of extensive reading and issue logs.

READING SUB-SKILLS

As a systematic process, reading has various skills necessary for different reading purposes such as the kind of information and amount of information needed. Skimming, scanning and lexical inference skills will be discussed below since they have been identified as the most important ones by several researchers (Eisenberg, 2002 and Scrivener, 1994).

Skimming

Skimming refers to “reading fast or glancing rapidly through the text to get a main idea of what the text is about” (Simensen, 2007, p. 149). Identifying key topics or the overall theme of the text are the main concerns of skimming (Eisenberg, 2002; Scrivener, 1994; Davies, 1995 and Grellet, 1981). Additionally, scholars such as Harmer (1991), Grellet (1981) and Williams (1984) support that for having the general picture of the text; readers simply glance through the text quickly by discarding irrelevant or inessential parts. Through skimming, readers have the advantage of being able to focus on the main topic or idea of the passage besides some of the developing or supporting ideas. In other words, skimming involves reading of the titles, sub-titles, the subjects, verbs, topic sentences, conclusion parts of the paragraphs to get the gist of the text.

In skimming, readers should be asked to detect facts which are expressed in sentences rather than single words (Grellet, 1981). Some skimming questions could be suggested to the teachers to ask the learners by glancing quickly through the text such as:

- What is the text generally about? (the teacher may ask them to read the title, sub-headings and the introduction or lead-in paragraph)
- What is the probable topic of the text? (the teacher may give a list of topics)
- Which of these pictures (diagram), etc. illustrate the text? (the teacher may provide several visuals)
- What is the main idea of the text? (the teacher may remind them that the main idea of the text generally appears in the first paragraph of a text or in the first sentence of a paragraph)

Scanning

Scanning refers to rapid glancing of a text for finding out a particular piece of information (e.g., name, date) (Nattall, 1982). In scanning, the main aim is to speed up your reading just focusing on the specific fact or piece of information without reading everything. When scanning, readers only try to identify specific information by just letting their eyes wander over the text until they find what they are looking for (Grellet, 1981; Harmer, 1991 and Williams, 1984). For example, if a reader aims at doing the research for an oral presentation, he/she could scan the index of books, web sites, and reference materials whether they contain any information he/she seeks for.

There are several ways of teaching scanning as Nattall (1982) notes for teachers. For example teachers may ask the students:

1. to find the time a plane leaves from London for Turkey (using a page from an airport timetable). Do not forget to tell them to keep in mind the key words: “from London” and “to Turkey”.
2. to look at page X and find out when the World War I started (using a page from a text book).
3. to find out how many times the phrase “burst into tears” occurs on this page.
4. to identify in which paragraph the topic of “advantages of technology” is discussed.

Skimming and scanning are two techniques of rapid reading which are similar in process but different in purpose. Scanning is not a complete activity since it rapidly covers a great deal of material in order to locate specific isolated and scattered information. On the other hand, skimming is relatively a complete activity that requires readers to get the gist of the reading text with the purpose of getting a general overview of the content.

Lexical Inference

As it was mentioned in the previous section unfamiliar or difficult vocabulary is the main problem of foreign/second language readers which usually resulted with the inadequate comprehension of the text material. Several researchers of the field (Harley & Hart, 2000; Paribakht, 2004 and Qian, 2004) maintain that readers use a variety of strategies when they encounter new words in a FL text. Ignoring them, consulting a dictionary for the meanings, writing them down for further consultation with a teacher, or trying to infer their meanings from context are some of these strategies (Harley & Hart, 2000). According to Paribakht (2004) and Qian (2004), inferring the meaning of unknown word is the most common strategy among the others. Oxford (1990, p. 47) defines lexical inference as “using a variety of linguistic and non-linguistic clues to guess the meanings of all the words when the learner does not know them”. Lexical inference can be regarded as an important strategy for coping with unfamiliar vocabulary since it requires a deeper processing of information available in the text itself which helps the reader to comprehend the text as a whole (Read, 2000).

Using this strategy requires an awareness of some knowledge sources ranging from knowledge of grammar, morphology, phonology, and knowledge of the world, to knowledge of punctuation, word association, and cognates (De Bot, Paribakht & Wesche, 1997). Successful inference depends upon using various knowledge sources (Nassaji, 2003). Knowledge sources are the clues the students make use of during the inference process. For a successful inference, FL teachers should make the students aware of these clues namely taxonomy of knowledge sources and strategies. They should train them how to use various sources effectively for developing their lexical inference skills (Shen, 2009).

The positive effect of lexical inference strategies on reading comprehension have been supported by several researchers (Mondria & Wit-de Boer, 1991; Paribakht, 2004; Qian, 2004). Depending on these researchers’ studies it could be claimed that lexical inference is an advantageous reading strategy since it not only speeds up the reading such as skimming and scanning but it also improves the reading comprehension. Moreover, it could be claimed that

lexical inference enhances the vocabulary acquisition depending on the assumptions of some scholars (Mondria & Wit-de Boer, 1991; Gao, 2012) about the positive effect of the mental effort in processing a word.

Intensive and Extensive Reading

Exposure to print is efficacious regardless of the level of child's cognitive and comprehension abilities. Even children with limited comprehension skills will build vocabulary and cognitive structures through immersion in literacy activities (Stanovich et al. in Grabe, 2009, p. 313).

Intensive and extensive reading are two common approaches used both in native and foreign language teaching and learning. Brown (2001, p3. 12) defines intensive reading as “a classroom- oriented activity in which students focus on the linguistic or semantic details of a passage. Intensive reading calls attention to grammatical forms, discourse markers and other surface structure details for the purpose of understanding literal meaning, implications, rhetorical relationships, and the like.” In parallel with the Brown's definition Nation (2009) also points out that intensive study of a text helps students increase their knowledge of language features and control over reading strategies. According to Long and Richards (1987) since it is a kind of detailed analysis of a text, it is generally a classroom based and teacher-led activity.

Nation (2009) mentions another goal of intensive reading as the core point in determination of the syllabus of the course because the language features focused in the reading material will be the subject of the course. He goes on to claim that it has several positive aspects as the subject will be given in the communicative context of the text. On the other hand, he warns that the text may have a mixture of various vocabulary and structure, so teachers should be aware of this fact while choosing the text and he advises teachers to ask “How does today's teaching make tomorrow's text easier?” (p. 26) and recommends four strategies to put this principle into effect:

1. Focus on items that occur with high frequency in the language as a whole. Such items will occur often in many different texts.
2. Focus on strategies that can be used with most texts.
3. Quickly deal with or ignore infrequent items.
4. Make sure that the same items and strategies get attention in several different texts (pp. 26-27).

Hedgcock, et al. (in González and Paola, 2011 p.38) lists the significant features of intensive reading as in the following:

- The teacher selects the texts to be studied, introduces, and reinforces certain reading strategies by means of whole-class instruction and student activities.
- Students read the same text at the same pace and complete several exercises that facilitate understanding.
- Teacher and students have clarity about what to do before, during, and after reading.

- Pre-reading activities are decisive to facilitate comprehension. These activities include surveying the text, making predictions, asking questions, and introducing key vocabulary.
- While-reading activities include first reading, a “quick read-through the entire text to develop a sense of its main point(s) and to confirm initial predictions made during pre-reading” re-reading the text: “read the text intensively through a careful and focused second reading”, looking closely at language, and considering the structure of the text.
- Post-reading activities entail summarizing and responding, thinking critically, and reading-writing connections. “Post-reading activities offer the best opportunities for teacher assessment of student progress, as they make the internal reading process and its outcomes more transparent”.

Nation (2009, p. 28) lists the features of a good intensive reading exercise and gives the first feature by quoting Davies and Widdowson as “A good reading exercise directs the learners’ attention to features of the text that can be found in almost any text, or to strategies for dealing with any text, with the aim to develop in the language learner the ability to comprehend texts, not to guide him to comprehension of a text”. Second feature of a good reading exercise is to direct the learners’ attention to the reading text, which means students read the given text or part of the text to do the exercises. Third feature is to provide the teacher and the learners with useful information about the learners’ performance on the exercise. Finally “A good reading exercise is easy to make. Teachers have to choose texts suited to the particular needs of their learners, and if these texts do not have satisfactory exercises, the teachers must make their own” (p. 29).

According to the Nation’s list we can conclude that a good intensive reading exercise can be applied to any text, makes the learners read the text and gives teachers and learners an opportunity to check their performances and it is easy to prepare and apply in the classroom.

Day (2003) explains that “extensive reading is based on the well-established premise that we learn to read by reading.... In teaching foreign language reading, an extensive reading approach allows students to read, read, and read some more” (p. 1). Nation (2009) accentuates that reading is a source of learning and it can help students learn and be familiar with new words and structures. Similarly, Willis (2008) mentions that extensive reading provides students with opportunities to see the new words in rich contexts.

Nation (2009, p. 50) summarizes extensive reading practice as “It is a form of learning from meaning-focused input. During extensive reading learners should be interested in what they are reading and should be reading with their attention on the meaning of the text rather than on learning the language features of the text”. By quoting Elley and Mangubhai, Nation (2009) states that the extensive reading practice can take place inside the class or outside class. In their article Day and Bamford (2002, pp. 137-139) offer ten principles for teaching extensive reading:

1. The reading material is easy. That is, in order to have the desired effect reading texts should be within learners’ competence level.
2. A variety of reading material on a wide range of topics must be available.
3. Learners choose what they want to read.

4. Learners read as much as possible.
5. The purpose of reading is usually related to pleasure, information and general understanding.
6. Reading is its own reward.
7. Reading speed is usually faster rather than slower.
8. Reading is individual and silent.
9. Teachers orient and guide their students.
10. The teacher is a role model of a reader.

As can be seen from above principles, extensive reading provides teachers and learners with a great variety of materials; moreover, these materials can be selected by the learners, which make reading fun, and also the amount of input can be increased.

After stating that extensive reading not only increases the vocabulary, but also helps proficiency development, Nation (2009, p. 55) gives some suggestions for vocabulary development as follows:

- a) Before reading a text, the learner quickly skims it and selects five or six words to focus on while reading. This has the effect of raising consciousness about some words and thus making them more noticeable when they are met again in the text.
- b) While reading the learner can collect new words that are repeated in the text to put on word cards for later deliberate study.
- c) A more formal follow up to this is for learners to report to the class on a word that they met while reading—explaining what it means, how it was used in the text, its word parts, its etymology, and any unusual features about it.
- d) The use of a dictionary while reading should also have positive effects (Knight, as cited in Nation, 2009), although this tends to increase the time it takes to read a text (Hulstijn as cited in Nation, 2009).

In their studies Nation and Wang (as cited in Nation, 2009, p. 56) conclude that in an extensive reading programme:

1. Learners should read at least one graded reader every week, no matter what level they are reading at. This rate of reading allows unknown vocabulary to be repeated before the immediately previous occurrence is forgotten.
2. Learners should read at least five books at a level (say Level 2) before moving to books at the next level (Level 3). This number of books provides a chance for most of the vocabulary introduced at that level to occur.
3. Learners should read more books at the later levels than the earlier. This is because the vocabulary of the earlier levels occurs very frequently in the books at the later levels. Books at the later levels thus provide good conditions for learning all the vocabulary of the graded reader series.
4. Learners should read at least 15–20 and preferably 30 readers in a year. This number of graded readers provides plenty of repetition for the vocabulary and provides the opportunity to meet most of the vocabulary several times. A programme where learners read only three or four graded readers per year is not an extensive reading programme.

5. Learners should work their way through the levels of graded readers as the later levels provide excellent conditions for establishing the vocabulary of the earlier levels.
6. Learners may need to study directly the new vocabulary at the earlier levels or at least make use of a dictionary when starting to read books at a particular level. This is because the density of unknown vocabulary tends to be a little higher at the earlier levels.

In conclusion, reading should be enjoyable for both students and teachers so that they can share and discuss about what they read. Day and Bamford (2002) also state that if this happens, the classroom “can be a place where students and teachers experience together the value and pleasure to be found in the written word” (p. 140).

A SAMPLE ACTIVITY FOR INTENSIVE READING

This activity cycle is taken from Macalister (2011).

The title of the reading text is ‘Seeing the ocean’, adapted from Vukčević’1997. The intended learners for this cycle are intermediate adult learners, and the language-focused learning goal is to recognize the ways in which reference words (pronouns) operate within the text.

Pre-Reading

These suggestions are intended for the teacher. The teacher asks questions about the learners’ experiences of visiting a foreign country/city for the first time.

1. Begin by drawing on the learners’ own experiences. Did they go to the foreign country/city by plane? Did they stop anywhere on the way? Where? What was the first thing they saw or thought or felt when they arrived?
2. Tell the students they are going to be reading one man’s account of his first impressions when he arrived in New Zealand. Everyone has different experiences. Ask them what sort of questions they might have before reading. Write the learners’ questions on one side of the board.
3. Tell them the title of the text. Write it on the top of the other side of the board. Ask them what words and ideas they associate with the word ‘ocean’. Record their answers.
4. Ask the students to work in small groups to put the words associated with ‘ocean’ into categories.
5. Hand out the reading text. Tell the students to read it with their questions from (2) in mind. Tell them they will be talking about these questions after they have read the text

Reading

The learners receive the text

Seeing the ocean

by Vuk Vukčević

1. I want to write about my first impressions of New Zealand—maybe **you**
2. can't even dream about my feelings at my very first step in your country.
3. I awoke in the aeroplane just a few seconds before I could see the top of
4. the North Island. I saw a lovely blue-green surface of ocean, shining in the
5. afternoon sun. **It** was stunning.
6. Auckland was the first city that I saw in New Zealand—just for a few
7. seconds. We had to go to Wellington. The airport seemed small to me
8. compared with airports in Belgrade, Singapore, Bangkok
9. But air! Air was the first thing I saw and felt in your beautiful country. **It** is
10. so clear and fresh and I remember my first breath here—I felt like a new
11. born child
12. My arrival here is a new birth for me. Learning the language is a step
13. forward. I am like a nine-month-old baby. When I reach eighteen months,
14. I will be a good English speaker.
15. Seeing the ocean close up was a second step. I like the ocean a lot, and
16. one day I chose to meet it; saying hello, touching the little waves on the
17. beach, and trying to see if **it** is very salty. Happiness for me is being able to
18. see the ocean, hear seagulls calling in the early mornings, spend summer
19. nights with my family looking at the calm, dark ocean surface from the
20. lawn and feeling the stillness of the world.
21. Sometimes, the starry sky seems so close to the earth that I can touch the
22. shining of a star's light. **We** are just sitting, without words, listening to the
23. silence of the night.

After Reading

1. Ask the learners about their reaction to the text. Did they enjoy it? Did they find answers to any of their questions?
2. Tell the learners you are now going to give them five true/false questions to answer. Ask them to read the text again to answer the questions.

He is writing this story for his family.

T () F ()

He thought the afternoon sun was stunning.

T () F ()

He thinks the air in New Zealand is fresh and clear.

T () F ()

He wanted to find out if the ocean is salty.

T () F ()

He likes to sit and look at the ocean by himself.

T () F ()

3. Before checking the answers with the learners, write the following line numbers and pronouns on the board. Ask them to identify what each pronoun refers to.

Line 1	you	_____
Line 5	it	_____
Line 9	it	_____
Line 17	it	_____
Line 22	we	_____

4. Once the students have done this, ask them to check their answers to the true/false questions. Then discuss the answers and how the learners have arrived at them.

CRITICAL READING FOR EFL TEACHERS AND LEARNERS

In our world today, by the advance in the technology and internet, specifically via smart phones, we can reach any kind of information easier than ever before. Not only can we reach the information but others can also reach us. They can share their thoughts, claims, and arguments via e-mails and social media. In other words, we are all surrounded by a very great amount of information claiming they are true. They may try to persuade and make us accept their thoughts or claims by playing on our feelings, likes, dislikes, fears and so on. Thus, as teachers we should make our students be aware of this fact and teach them how to read critically.

The word *critical* is often misperceived as having negative sense. As Nosich (2011) mentions *critical person* is not the person who always finds faults or to *criticize* does not always mean saying negative things. But actually, it is related to the word *criteria* and it is clearly explained by Goatly (2000) as “resisting the assumptions on which rational arguments are based, by explaining and questioning how common-sense logic establishes its categories” (p.1). In order to handle and analyse a text critically Fairclough (as cited in Goatly, 2000) offers three levels of text analysis: (1) decoding the surface structure and the meaning of a text, (2) interpreting and inferencing what is written (or said), (3) explaining the ideology behind the text or discourse. In order to read a text critically and explain the ideology, it is important to learn how to ask probing questions. To be able to ask hard-hitting questions we need to acquire and develop some necessary knowledge.

DISTINGUISHING BETWEEN FACT AND OPINION

To be able to recognize the facts and opinions in a discourse is a crucial skill for reading and analysing a text critically. As a receiver we cannot criticize the facts but we should be alert that some personal thoughts might be served us as facts. At this point distinguishing between fact and opinion carries out an important role. To start with the definitions of facts and opinions will help us discriminate them. Rasool, Banks, and McCarthy (1993) mention three definitions of ‘fact’ as:

1. A fact is something most of us agree is true.
2. A fact is something that is true.
3. A fact is something that can be proven beyond a reasonable doubt (pp. 68-69).

Similarly, Fahnestock and Secor (1990), Swinburne and Warner (1992), Pirozzi (2003) and Starkey (2004) define fact as something that can be verified, or confirmed in an unbiased manner and when it is verified, we must accept it.

On the other hand, an opinion is subjective and they depend on the people's individual beliefs and thoughts. An opinion represents personal point of views. Pirozzi (2003, p. 371) explains this notion as "Someone's personal judgment about something that has not been proved, verified, or confirmed in an unbiased manner."

Opinions may be based on facts, but they are still what we think, not what we know. Opinions are debatable; facts usually are not. A good test for whether something is a fact or opinion is to ask yourself, "Can this statement be debated? Is this known for certain to be true?" If you can answer yes to the first question, you have an opinion; if you answer yes to the second, you have a fact. If you're not sure, then it's best to assume that it's an opinion until you can verify that it is indeed a fact (Chesla, 2005, p. 28).

To see the difference clearly, consider the following examples:

1. World War I broke out in 1914.
2. Sydney is the capital city of Australia.
3. Many experienced mechanics tell us that Audi is the best car today.
4. This is the scariest movie of this year.
5. The summers in Gaziantep are horrible because they are always very hot.
6. İnönü, who was the second president of Turkish Republic, was a great leader.

When we consider the above examples in the light of the definitions, we can easily say that the first two sentences are facts (although the second sentence is false) because they can be verified by a little research. On the contrary, sentences three and four are simply opinions because both sentences have superlative forms which can change from person to person. In the last two sentences the hotness of Gaziantep and the second president of Turkish Republic can be verified; however, the adjectives 'horrible' and 'great' are simply subjective, so we can say that these sentences are combinations of facts and opinions. A person might like very hot climate and it would be wonderful for him/her. Similarly, some people would agree that İnönü was a great leader while the others disagree.

There are some words that signal the opinions and make it easy to identify the opinions in a text or speech. These are:

Believe/Think	Best/worst	Expect
Feel	In my opinion	Least/most (with adjectives)
May/may not	Might/might not	My impression is...
My perspective is...	My point of view is...	My sense is...
Possibly	Probably	Should/should not

In summary, we should bear in mind that the first step to critical reading is to differentiate facts from opinions. When we notice there is an opinion, we can talk about an argument and then we can ask thought-provoking questions or we can object to them if there is any faulty.

SAMPLE ACTIVITIES FOR FACT AND OPINION

Activity 1. Decide whether the following sentences are Facts or Opinions

1. ____ Penguins live in the South Pole.
2. ____ Some universities have over a hundred thousand students in Turkey.
3. ____ The students who have flue should stay at home instead of going to school.
4. ____ Vegetables can be kept fresh for some time in a fridge.
5. ____ Ronaldo scored the most goals this season.
6. ____ Spring is the prettiest season because many flowers are blooming.
7. ____ Smoking is an irritating habit.
8. ____ Mr. Steward is sixty years old.
9. ____ I think Schumacher has been the best goalkeeper ever in Turkey.
10. ____ Rollercoaster is scary, but it's also a lot of fun.

Activity 2. Highlight facts and underline opinions in the following paragraph.

Samuel Fernando Gonzales lived in New Jersey and was a senior student at Michigan Institute of Technology. He was the leader of gang called “crimebusters”. He was very brave and fought with crimes with his intelligent tactics. He was also handsome, many girls admired him. He was killed by an accident at the age of 24.

RECOGNIZING AND EVALUATING ARGUMENTS

Like the word critical, argument is generally misunderstood similar to having debate or quarrel as in “I had an argument with my mom last night”. Conversely, in critical reading, argument means stating the claims and supporting them with some reasons and evidence. A broad definition of argument is given by Copi and Cohen (2004) as:

A collection of propositions in which some propositions, the *premises*, are given as reasons for accepting the truth of another proposition, the *conclusion*. In other words, the *conclusion* of an argument is the proposition that is affirmed on the basis of the other propositions in the argument. These other propositions, which are affirmed (or assumed) as providing support or reasons for accepting the conclusion as true, are the *premises* of that argument (p. 3).

As seen in the definition, an argument has two parts, one of which is a premise or premises supporting the other part, namely conclusion. So as to critically examine and evaluate an argument, we should be able to realize the existence of an argument in a discourse first. Walton (2006) states that “The ability to identify an argument by stating its premises and

conclusions is a very valuable skill of critical argumentation. Only when an argument has been thus identified can it be critically examined in a clear and objective fashion” (p. 7).

The order of the premises and conclusion may change; in other words conclusion may be stated at the beginning or at the end. There are some words that signal premises and conclusions and they are called as premise and conclusion indicators in several references. A compilation of these indicator words from different resources are listed below (Bowell & Kemp, 2002, 2005; Boyd, 2003; Copi & Cohen, 2004, 2005; Hurley, 2000; Jason, 2001; Walton, 2006):

Premise Indicators

as	as indicated by	as shown by
assuming that	because	due to
follows from	for	for the reason that
given that	in view of the fact that	inasmuch as
insofar as	may be deduced from	may be derived from
may be inferred from	my evidence for this	my reason is
on the assumption that	owing to	seeing that
since	the reason is that	this is so because

Conclusion Indicators

accordingly	therefore	consequently
hence	so	then
thus	as a result	in summary
in consequence	it follows that	entails that
proves that	it is clear that	for this reason
for these reasons	I conclude that	we may infer
which entails that	which implies that	which means that
bears out to the point that		leads me to believe that
suggests very strongly that		which allows us to infer that
which points to the conclusion that		which shows that

In the light of the given indicators we can consider these examples:

- You should graduate from college because you will earn more money with a college degree.
- The need for the United States to send troops to Central America is indicated by the build up of armed rebels in countries neighboring those with civil wars.
- Seeing that the current policy of supplying organ transplants is benefiting the rich, a new program is needed.
- Based on all of the reasons just stated, we can *conclude that* the flow of illegal drugs must be stopped.
- *In summary*, postal rates must be increased because we can no longer afford to run the postal system with a deficit.
- We have had very little rain this season. *Consequently*, water will have to be rationed.

In the above examples underlined words show the premises of arguments, on the other hand italicized words show the conclusions. These indicator words can help us to determine the parts of arguments; nonetheless, Jason (2001) warns us that these indicator words do not always signal an argument (p. 37). For example: I have been working here since 2005. Besides, there may be arguments without indicators or even without premises or conclusions and they want us to deduce it. E.g., this shampoo makes my hair feel so soft. In this example, there is an argument, that is, this shampoo makes my hair soft and it will make your hair soft, too. Therefore you should use it.

After identifying arguments, we should evaluate and be critical about them. As Hurley (2000, p. 1) states, arguments can be classified into two basic groups. The first group includes the arguments whose reasons actually support the conclusion and the other includes the arguments whose reasons do not. The first group is called as good (cogent) arguments, and the latter is called as bad (fallacious) arguments.

CONCLUSION

Reading is not simply a matter of absorbing individual words; rather, it is a progressive effort to construct a model of the meaning of the text (Armbruster, as cited in Kurfiss, 1988, p. 32). The expression ‘reading between the lines’ has been developed for this reason. As Kahane and Cavender (2006) explain that “this phrase has several meanings one of which captures the idea of understanding the intentions which are not clearly expressed. The other meaning is getting more information from less, and noticing the rhetorical devices” (p. 13). Wallace and Poulson (2004, p. 7) illustrates the critical approach to reading as follows:

Table 2. A critical approach to reading

As a critical reader you:	
✓	consider the authors’ purpose in writing the account
✓	examine the structure of the account to help you understand how the authors develop their argument
✓	seek to identify the main claims the authors make in putting forward their argument
✓	adopt a skeptical stance towards the authors’ claims, checking whether they support convincingly what they assert
✓	question whether the authors have sufficient backing for the generalizations they make
✓	check what the authors mean by key terms in the account and whether they use these terms consistently
✓	consider whether and how any values guiding the authors’ work may affect what they claim
✓	distinguish between respecting the authors as people and being skeptical about what they write
✓	keep an open mind, retaining a conditional willingness to be conceived
✓	check that everything the authors have written is relevant to their purpose in writing the account and the argument they develop
✓	expect to be given the information that is needed for you to be in a position to check any other literature sources to which the authors refer

Thorndike (as cited in Nielsen, 1989, p. 2) claims that critical reading is a form or instance of critical thinking which is consistent with the more general assumption that reading

is thinking. Since thinking is an active process, it can be said that reading is also active; actually, reading must be active not to be deceived.

In summary, it can be said that as critical readers and teachers we should know how to unearth senders' intentions which are committed particularly to persuade others, and try to model our students develop an understanding of critical reading and also listening.

Carter, K.C. (2004). *A First Course in Logic*. New York: Pearson Longman Education.

Nation, I.S.P. (2009). *Teaching ESL/EFL Reading and Writing*. New York: Routledge. This reference book is a useful source for teachers who teach reading in foreign language classrooms. The first six chapters of the book are devoted to reading, specifically, the first chapter deals with learning to read in another language.

Starkey, L. (2004). *Critical Thinking Skills Success in 20 Minutes a Day*. New York: Learning Express LLC.

All these three books give explicit and clear information about critical thinking and reasoning, and these books offer some classifications for reasoning fallacies. The last book also has practical exercises for classroom use.

SAMPLE LESSON PLAN

A SAMPLE LESSON for FACT and OPINION		
Type	An inductive approach to the teaching of identifying facts and opinions in written texts	
Goals	Students will have - distinguished between facts and opinions in written texts - developed an insight in identifying whether a statement is a fact or an opinion - recognized signal words commonly found in facts and opinions	
Materials	Written text samples. PowerPoint slides.	
Teaching Modes	Group work, lecture, classroom discussion	
Time	45 + 45 (90 minutes approximately)	
Procedure	Pre	1. Students are given three sets of five sentences and asked to determine which one of five sentences is different from others.
		2. Students are asked to determine what makes the sentence they have chosen different from those of others.
	While	3. The answers are elicited by using guided discovery method.
		4. The students are introduced to definitions of facts and opinions.
		5. The students are exposed to some of the common signal words utilized in fact and opinion sentences.
		6. Students are given new sentences to be identified as fact and opinion by referring to the key signal words.
	Post	7. Students are given some fact sentences and asked to turn them into opinions.
		8. Students work in groups of four. Each group is given a written text to be analyzed in terms of fact and opinion statements.

Chapter 65

TEACHING GRAMMAR

Banu Inan Karagul and Dogan Yuksel

Kocaeli University, Faculty of Education
English Language Teaching Department, Izmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. identify the significance of grammar in language teaching.
2. familiarize with the different ways of teaching grammar in the language teaching classroom.
3. list advantages and disadvantages of these different approaches.
4. familiarize yourself with different techniques of teaching grammar.

STUDY QUESTIONS

1. What is the role of grammar in language teaching? Is it necessary to teach grammar?
2. What are the different ways of teaching grammar in the language classroom?
3. How would you prefer to learn the grammar: from examples or rules?

INTRODUCTION

In the language classroom, one of the most important parts of being a teacher is presenting new language, supplying some opportunities to practice it and make revisions when necessary. Whether to teach grammar or not has always been a controversial issue among researchers and practitioners of language teaching. Even though it is acknowledged that people learn languages differently, the process of learning becomes easier if they are able to perceive regularities and patterns (Gower, Philip & Walters, 1995). However, we are all

familiar with students who are really good at identifying grammatical structures and who can list the basic usage related to each of them but who cannot use them in real communication. As suggested by Larsen-Freeman (2001), grammatical knowledge is important as long as it enables learners to communicate “correctly, meaningfully and appropriately”. In order to emphasize the inadequacy of form-based teaching and going beyond form, she suggested her three-dimensional framework including “form”, “meaning” and “use”. Larsen-Freeman (2001) pointed out that if students are not aware of the fact that grammatical structure has these 3 dimensions, they are prone to making mistakes even if they know the rules of the target language. In order to explain the connection between these dimensions, Savage et al. (2010) give the following example:

Form:	MUST + the base form of the verb (infinitive without to)
Meaning:	obligation or necessity
Use:	formal, used much more in writing than in speaking. In speaking, people tend to use “have to”.

According to Freeman’s this three-dimensional framework, when students are aware of all these three dimensions of modal verb “MUST” in English, they will be able to use it correctly, meaningfully and in appropriate situations.

The Place of Grammar in the History of Language Teaching

Grammar has always been considered to be an important component of language since the emergence of first language teaching methods. In the 19th and mid-twentieth century method, *The Grammar-Translation Method (GTM)*, grammar rules were taught explicitly and a lot of attention was paid to language forms. However, because of the lack of communicative practice, students were not able to use them successfully. For this reason, a new method appeared in the first part of the 20th century, which was *The Direct Method*. In this method, grammar was taught inductively, which was found to be inappropriate for some adult learners; therefore, led to failure.

Between 1950s and 1960s, *Audiolingual Method* appeared which emphasized the importance of developing aural-oral skills. In Audiolingual Method, the syllabus was structural and there was the use of drills to reinforce grammatical patterns. Students were really good at these drills; however, when it came to producing new sentences, they were not able to transfer their classroom skills into the outside world. In 1970s, in *Cognitive Approach*, it was claimed that grammar needed to be taught either deductively or inductively because it was considered to be an indispensable part of the language learning process. But again communicative practice was neglected. In 1980s, *Natural Approach* appeared thanks to the theories of Stephen Krashen. First language acquisition was taken into consideration and it was thought that grammar should not be taught overtly; instead necessary input should be supplied so that learners can grasp the grammatical structures from this oral and written input. However, many adult learners wanted and needed grammar instruction; that’s why, it was not very effective.

While the discussions related to Cognitive Approach and Natural Approach were going on, in 1970s, other important methods, the influence of which is still going on, appeared. It was *Communicative Language Teaching (CLT)*, in which communication was the main goal of instruction and for the sake of this communicative focus, grammar was ignored. Because fluency was important, some students could never master the grammar of the target language.

As can clearly be seen from the important changes mentioned above, the role of grammar was either over-emphasized or it was neglected and both of these attitudes might be observed in the written works of educational researchers and practitioners. As suggested by Hedge (2000), if it is believed that there is a necessity of a focus on grammar, the following issues will be related to integrating grammar teaching into a communicative methodology paying attention to all aspects of communicative competence and the precise forms that teaching should take. Hedge also states that there will also be some further questions about the choice of grammatical structures to be presented, the forms of grammatical description, whether to use 'deductive' or 'inductive' approaches, the role of practice and the forms of practice appropriate for different types of learners.

Major parts in a grammar lesson consist of the following:

PRESENTATION

TASK 1: Think of the grammar presentation techniques you know. In your opinion, which one has got most benefits and why?

TASK 2: Choose one of the grammar topics given below and think of a technique that you use to present it to your students:

- the difference between SOME and ANY
- Tag Questions
- the difference between Simple Past Tense and Past Continuous Tense

Your lesson must last 10 minutes only. While preparing your mini-lesson, please think about the aims of your presentation, the stages of your presentation and effective techniques of presentation.

(adapted from Tanner and Green, 1998)

Deductive vs. Inductive Grammar Presentation

In deductive (explicit) grammar presentation, the teacher states the name of the grammar topic to be studied and explains it. The teacher first says, "Today we are going to study Present Continuous Tense". After introducing the subject, the teacher usually writes the conjugation of the words on the blackboard and asks the students to copy them to their notebooks. After mastering this part, sentence level examples are provided in various forms. A chain of drills is followed after this process. The drills start from simple and go further to more complex structures. Finally, some production exercises can be used with higher

proficiency levels. This sequence is also named as the PPP (Presentation-Practice-Production) Model.

Hedge (2000) explains the purpose of the each stage of activity and the teacher's roles in the model given above in the following way:

Stage	Purpose	Teacher's roles
Presentation	– to present new language in context so that meaning is clear – to link the new form to what students already know – to check comprehension	Instructor Corrector
Practice	– to help students memorize the form – to give intensive practice through repetition – to provide opportunities for feedback and error correction – to develop confidence	Manager Evaluator Corrector
Production	– to reduce control and encourage students to find out what they can do – to encourage students to use the forms in expressing their own content – to help students see the usefulness of what they have learnt – to check what has been learnt and diagnose problems	Monitor Resource Diagnoser

According to Widodo (2006), advantages of deductive approach in grammar teaching are as follows:

1. It is time-saving.
2. Rules are simply and clearly explained
3. Immediate application of the rules through direct examples is provided.
4. It respects the intelligence and maturity of the adult learners
5. It meets the expectations of those learners who have analytical style

Inferring the grammar rules according to some examples provided is the main premise of an inductive approach. This is also how most native speakers acquire the syntax of their own languages. It is also called rule discovery learning (Widodo, 2006). Direct Approach and Natural Approach followers would use it frequently. Thornbury (2002, p.65-66) provides the following example of inductive grammar presentation.

TEACHING VERBS THAT TAKE BOTH GERUND AND INFINITIVE FORMS USING CONCORDANCE DATA

One persistent headache for learners is knowing which verbs in English are followed by the infinitive. This problem is complicated because sometimes both are possible with a subtle difference in meaning. In this sample lesson, the teacher has decided to use concordance data to guide the students towards discovering these differences for themselves.

STEP 1: The teacher divides the class into three groups (A, B, and C), and gives each group a different set of concordance lines as shown here:

Group A: *Remember*

REMEMBER (19:26, 07.05.98)

d Yanto, thoughtfully. On the other hand, I *remember* seeing them dancing together at a ball shortly before the month's Top to Tail if you own a poodle. *Remember* to listen out for Katie and friends on Radio 2. Should you here wasn't anyone to see me go. I *remember* thinking how white and cold her face looked, with ve food started to decrease in September, so *remember* to feed fish. Remember to check on them from time to ti t remember being so unhappy - not ever. I *remember* being in La Scala, Milan during the war. In the early 40s her to a colliery tip about four miles away. I *remember* going to a fruit and flower market in Leeds very early one what I can do but it's all working. Oh I must *remember* to take that film out. Is that the finish of it total? All I rem (which doesn't mean there weren't any). 'I *remember* seeing pictures of a fish like that at school, but I'm damn was working in Worcester. 'I don't seem to *remember* seeing you in church, Bridget,' said Clare. The last thing ber to feed him,' so I'll just have to *remember* to bring an electric drill up and see what I can do but it's i ehudi Menuhin was in town for a concert. I *remember* being rather keen on Bert when I was about fifteen. Whe

Group B: *Forget*

FORGET (18:53, 07.05.98)

ernment last year announced that those who *forget* to flush public toilets will be fined up to US dollars. Results frothy fronds lit up by evening sun. I'll never *forget* seeing your Grandfather for the first time. I couldn't believe acting inspector over the weekend. I'll never *forget* being in hospital. s are getting shorter it doesn't mean you can *forget* having a bit of fun in the garden. Results of your search Yo othes. For instance, if you load Windows, but *forget* to take the mouse out of the bag, you can just clip the Tosh live alone. If you are leaving the area do not *forget* to pick up any clothes that are at the cleaners, or shoes, e, where shamrock fans forget to blur. Don't *forget* to put your clocks back tomorrow night. Once the removal o our or two watching TV together. She hadn't *forgotten* going to the pictures with Vernon to see The Song of Pa y solutions found for this query M. B. I never *forget* being called by a superintendent who said: 'Sergeant Bullo to add more volume of food daily. I must not *forget* to say something to the whole school about her.' Don't corr forget to bring music. 'Now eat up and don't *forget* to take your litter home with you.' If there is anything else yo

Group C: *Stop*

STOP (19:18, 07.05.98)

tense, listening. At the age of twelve, Bailey *stopped* eating meat. Although he had already taken his first mout though Anna was sure her mother had not *stopped* having baths or using perfume. Annabel was determined asthma? And it was two o'clock when they *stopped* talking, they *stopped* having their break! Results of your s s of Ron's hard training schedules. I finally *stopped* going to school when Charlie did, and Eva arranged for m ould appreciate it if the two gentlemen who *stopped* to help me when I had an accident with my car on the roa these last two days,' she told him when he *stopped* to greet her and ask if she had heard the brilliant spontan day I was filling up with petrol when a chap *stopped* to say he was a member of the Ferrari Owners Club and examine his reflection in the mirror. The bus *stopped* to pick up a passenger off one of the first terraced streets to the newspapers, but Mr Carter has never *stopped* believing he could solve the world's problems. But Joy defeat as gracefully as he could. Churchill *stopped* to take a cigar from the flap pocket of the one-piece siren he idea that had flitted through his mind. He *stopped* eating and reached across and took his wife's hand. I'd st

She tells the groups to study their lines, and divide them into two patterns. If they find it difficult, she suggests that they look at the form of the verb that immediately follows the word in the central column of each set of lines. They are then instructed to try to work out the differences in meaning between the two patterns, still in their groups. The teacher monitors the group work, offering assistance where necessary.

STEP 2: The teacher then re-groups the class so that at least one member of each of the former groups A, B, and C, is in each of the new groups. Their task is to explain to each other the patterns of form and meaning that they have found for their particular verb, and then, as a group, to work out a general rule that holds for all three verbs. They then report to the class.

STEP 3: The teacher summarizes by drawing the following timelines:

In order word, in the case of **1** the *doing* precedes the *remembering*, *forgetting* and *stopping*. In the case of **2**, this sequence is reversed.

STEP 4: To check their grasp of rule, the teacher then hands out a discrimination exercise. For example:

1. I went to the post office but I forgot *to post/posting* the letter.
2. I don't remember *to see/seeing* the Millers at the party.

Previous literature on inductive and deductive approaches to teaching grammar also highlights the advantages and disadvantages of these approaches. For example, Widodo (2006) lists the following advantages and disadvantages of an inductive approach to grammar.

TASK 3: Choose a grammar topic and prepare a similar lesson plan based on the one above. You can make use of the following websites to reach examples from corpus:

www.americannationalcorpus.org

- www.natcorp.ox.ac.uk
- corpus.byu.edu
- www.americancorpus.org

Advantages

1. Learners are trained to be familiar with the rule discovery; this could enhance learning autonomy and self-reliance.
2. Learners' greater degree of cognitive depth is "exploited".
3. The learners are more active in the learning process, rather than being simply passive recipients. In this activity, they will be motivated.
4. The approach involves learners' pattern-recognition and problem solving abilities in which particular learners are interested in this challenge.
5. If the problem-solving activity is done collaboratively, learners get an opportunity for extra language practice.

Disadvantages

1. The approach is time and energy-consuming as it leads learners to have the appropriate concept of the rule.
2. The concepts given implicitly may lead the learners to have the wrong concepts of the rule taught.
3. The approach can place emphasis on teachers in planning a lesson.
4. It encourages the teacher to design data or materials taught carefully and systematically.
5. The approach may frustrate the learners with their personal learning style, or their past learning experience (or both) would prefer simply to be told the rules

A caveat we should keep in mind is the fact that most skilled teachers use both approaches efficiently while teaching grammar. They sometimes present the grammar rules explicitly (deductive) and in some other occasions, they help their students discover the grammar rules from the examples provided. The combination of the both approaches is also used in Grammar Based Teaching (GBT) which uses grammar as a springboard for meaning, communicative practice opportunities (Azar, 2007).

DISCOVERING GRAMMAR

Instead of starting teaching grammar by introducing the rules, making students work out for themselves how language forms are constructed and used is another possibility in teaching grammar. Afterwards, students might be asked to do exercises related to that specific grammar rule. There are multiple ways of doing this such as starting the lesson with examples, with a reading passage, with a listening exercise including a dialogue which contains the target grammar rule, etc.

In the following example, students are given a short reading text and they are supposed to identify the target grammar form, which is "The Simple Past Tense", and then, a practice part follows:

Reading Text

Students read the text above in pairs and they are asked to underline the structures that they are not familiar with and then, to work out the rules of The Simple Past Tense in English. Afterwards, the teacher states that there are two types of verbs in English; namely, ‘regular’ and ‘irregular’. Students are also asked to identify which verbs in the text are regular and which of them are irregular. And then, practice activities follow.

When I woke up this morning and opened the door, I found a letter coming from my aunt. In the letter, she said she was in Hawaii for vacation. She also wrote that she liked the island very much; she swam in the sea, sunbathed on the Waikiki Beach and took part in some local tours around the island. And then she wrote about the friendly people of the island. After reading the letter, I really wanted to see this island. I called my travel agent and wanted him to book a flight for me. Afterwards, I booked a hotel room for a week for myself. I feel really excited because I am going to join my aunt and spend good time in that place.

PRACTICE

After the presentation part is over (either deductively or inductively), there is a need for students to practice the newly-learnt items. In this part, as also suggested by Hedge (2000), students not only find the chance to get some feedback from the teacher in order to reformulate their utterances, but they also develop confidence. However, not all the activities are appropriate for the practice part. Thornbury (2002) mentions two important principles that should be kept in mind:

THE E-FACTOR (Efficiency= Economy, ease, efficacy) The efficiency of an activity might be discerned via answering the following questions: - How time-efficient is it? - How easy is it to set up? - Is it consistent with good learning principles?	THE A-FACTOR (Appropriacy) The appropriacy of an activity pays attention to the following concepts: - learners’ needs and interests - learners’ attitudes and expectations
--	--

GRAMMAR GAMES

Use of games in grammar teaching is a recently trending issue. There are volumes of books that specifically focus on the issue of grammar games (e.g., Rinvolucris & Davis, 1995;

Johnson, 2003). Many games from television and radio as well as games people play at home in their everyday lives can be adapted for classroom use as well (Harmer, 2007). Many experienced teachers can also prepare some grammar games with ease. The following sample is adapted from Harmer (2007).

Asking the right question

Language Level: Any

Age: Older children (+)

Level: Elementary (+)

Instructions: Students sit in two teams. There is a pile of cards between them. On each card there is a word or phrase. The cards are face down.

A member of team A picks up the first card and then has to ask the other team members questions until they give the exact answer that is written on the card.

university	teaching	hot	summer	Yes, I did
------------	----------	-----	--------	------------

The focus: The game should push students to think extremely carefully about the exact construction of the questions they are asking.

CONCLUSION

Two questions are commonly asked about teaching grammar: Should we teach grammar or not? and How we should teach grammar? The issue of teaching grammar or not is a hot debate and addressing it requires a theoretical focus which was not the scope of this chapter. Instead, in this chapter, we tried to focus on the intricacies of how we should be teaching grammar. Advantages and disadvantages of different approaches to grammar have been highlighted by presenting various examples.

Chapter 66

INTEGRATED SKILLS IN LANGUAGE TEACHING

Andreea Nicolaescu

Kocaeli University, Faculty of Education,
English Language Teaching Department,
Izmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. define the concept of integrated skills as it currently applies to language teaching.
2. identify various types of and approaches to integrated skills instruction.
3. design and evaluate practical activities for implementing integrated skills into your lesson plans.

STUDY QUESTIONS

Before you start reading this chapter, try to reflect on the following questions:

1. What does integrated skills in language teaching refer to?
2. What might be some reasons for using integrated skills in a language curriculum?
3. What are some principles and techniques for designing lessons based on integration of various skills?

INTRODUCTION

Realistically, how often do you talk without listening? Or write without reading? For just about most situations we can imagine from our daily lives, several language skills are used simultaneously for communicative purposes. In the past several decades, much evidence has emerged that, in order for learners to attain competence in a language, teaching needs to integrate both linguistic and communicative skills (Hinkel, 2009).

Rebecca Oxford compares the idea of teaching English as a second or foreign language (ESL/EFL) to the image of an intricate tapestry woven from many strands which include the teacher, the learner, the setting, and the primary language skills of listening, reading, speaking, and writing (Oxford, 2001).

The skill strands of the tapestry lead to optimal ESL/EFL communication when the skills are all interwoven during instruction, a practice known as the integrated-skills approach. In other words, when several of the language skills are utilized within a lesson or activity, more authentic communication and more effective and meaningful learning occurs. A typical instructional paradigm found in many locations around the world focuses on employing learners' receptive skills in order to provide input and modeling for their productive skills. For instance, in the spoken medium, listening selections are used as models for speaking, interaction, or pronunciation skills, whereas in the written medium, reading input provides models for writing. The central innovative characteristic of the communicative approach in ESL or EFL teaching has been the integration of the four primary skills and their components.

Communicative Language Teaching (CLT) emphasizes the teaching of listening, speaking, reading, and writing within content and task-based activities (Richards and Schmidt, 2002). Prior to communicative language teaching approaches, the prevalent attention to the grammatical forms of language prompted curriculum designers and instructors to focus on the separate language skills, a practice referred to as the segregated-skill approach. Many pre-university intensive skills courses still use a separate skills approach, probably mostly due to administrative considerations, which make it easier to program separate courses. In the segregated-skill approach, the mastery of discrete language skills such as reading or listening is perceived as the key to successful learning, and language learning is typically separate from content learning (Mohan, 1986). Specialized, subject-specific courses may be practical when meeting the needs of higher proficiency learners who might need to focus their attention on improving one specific skill.

However, if communicative, interactive use of the target language is the primary objective, then skill integration is, according to Brown, "the only plausible approach to take" (Brown, 2001). The four macro skills (listening, speaking, reading and writing) are all an integral part of typical language proficiency and use. Separating the core skills is counterintuitive to the integrated way that people use language skills in natural communication, and it conflicts with the direction in which language teaching experts have been proceeding in recent years.

Research indicates that even if it were possible to fully develop one or two skills in the absence of all the others, such an approach would not ensure adequate preparation for future success in academic communication, career-related language use, or everyday interaction in the language. "Despite our history of treating the four skills in separate segments of a curriculum, there is a recent trend toward skill integration" (Brown 2001). Even if a course title indicates a discrete skill such as "Academic Reading," for example, it would be more beneficial to integrate various skills in addition to the primary focus on the reading component. For example, in preparation for reading a text, the instructor could facilitate an activity in which the students employ their speaking and listening skills by activating their background knowledge of the topic through a paired brainstorming activity or a class discussion.

Following the reading of the text, the students could be asked to employ their writing skills by paraphrasing, summarizing or evaluating the reading in a written format.

ACTIVITY 1	Exploring Your Beliefs: Reflect on how you feel about each of the statements below and find out whether your classmates agree or disagree with the statements. Choose three issues and discuss them with at least three students in the class. Make sure to provide a rationale for your answers.		
STATEMENT	I AGREE because...	I DISAGREE because...	I AGREE WITH RESERVATIONS because...
1. People have learned languages for centuries, so the methods we use do not really matter.			
2. The most important thing is to let students experiment with the language (spoken and written). They learn the language by using it and need to be given many opportunities to do so.			
3. Students learn best when they are first presented with a clear explanation of grammar rules. Then, they can apply the rules and use them freely.			
4. Class time should mostly be spent focusing on language structures. Meaning can be added later on, once students can express themselves.			
5. Accuracy develops naturally. We should not worry too much about students producing perfect structures right away. It is best for teachers not to overcorrect.			
6. Language is best learned interactively, in a social environment. In an ideal class, students work together a lot.			
7. Student motivation does not matter. They will learn regardless of their motivation.			

Source: Hedwige Meyer, University of Washington.

Nunan (1989) believes skills integration to be an important feature of language learning, which appeals to interaction, task continuity, real world focus, language and learning focus and task outcomes. In other words, when several of the language skills are incorporated into a lesson or activity, the task become more holistic and reflective of real-world language use.

ADVANTAGES OF THE INTEGRATED SKILLS APPROACH

Communication, by definition, requires the integration of the main language skills; in integrated- skill instruction, learners are exposed to authentic language and are involved in activities that are meaningful and interesting (Shen, 2003 qtd. in Akram and Malik, 2010). In order to facilitate meaningful activities which highlight real language in use, educators emphasize the importance of implementing content-based and task-oriented instruction. By using the integrated skills approach in a language classroom, learners experience the language in a natural and authentic way, benefitting from a true perspective of the rich intricacies of language as it is applied in genuine communication. In addition, by integrating the language skills, learners progress not only in their acquisition of the various skills but also in increased knowledge of subject-specific content, as opposed to just focusing on discrete language forms. When a language instructor teaches a language by introducing meaningful and engaging class activities incorporating the various skills, it enhances the focus on realistic communication, which also leads to intrinsically motivating and encouraging the students to want to learn the language and be more involved in classroom activities.

LIMITATIONS OF THE INTEGRATED SKILLS APPROACH

A potential limitation of the integrated skills approach might be that some learners will have disproportionately developed proficiencies across the four primary language skills. For example, second language learners who live in English- speaking countries may have stronger skills in listening and speaking and social discourse than in reading and writing in academic settings. On the other hand, English as a foreign language learners are likely to be better readers and writers than listeners and speakers since typically their primary learning of these skills occurs within the classroom. For this reason, the teaching of integrated skills can become somewhat complicated, when instructional materials and practice have to account for a considerable variance in learners' abilities. In addition, since the primary focus of integrated instruction emphasizes purposeful communication and discourse competence, the teaching of grammar as well as accuracy in learner language production may receive less emphasis than it should (Richards, 2005 qtd. in Hinkel, 2009).

OVERCOMING THE LIMITATIONS

With the current emphasis on both fluency and accuracy in language production, integrated language teaching and learning, as well as integrative instructional models, will need to continue to be refined and developed (Swain, 1991 qtd. in Kaplan, 2010). Lessons which provide explicit instruction in both language forms as well as how to accurately use those in the context of communicative tasks would enable the students to have more command of the target language. All things considered, after decades of research in language teaching and learning, it becomes evident that in many cases and for many purposes, the separation of the four primary language skills is likely to be less effective than integrated instruction simply because, in reality, communication does not take place in terms of discrete

linguistic skills (Hinkel, 2009). Even if it were possible to develop one or two skills effectively in the absence of the other language skills at the beginning stages, this does not ensure adequate preparation for real international communication, in which not only language skills but also communicative skills are employed simultaneously (Akram and Malik, 2010). When a language teacher approaches a language by introducing authentic and thought-provoking class activities encompassing the four skills, it enhances the focus on realistic communication, motivating the students to learn the language and be more enthusiastically involved in classroom activities.

TYPES OF INTEGRATED SKILLS INSTRUCTION

Integrated language instruction that engages learners in meaningful communication and enables them to attain their learning objectives can be found in a practically unlimited array of models, teaching materials and techniques.

ACTIVITY 2	Think of the language skills that might be used in the following situations. Put a check mark in the appropriate columns. Then add four more situations and put a check mark under the skills that might be involved.			
SITUATION:	LANGUAGE SKILL: Reading	Writing	Listening	Speaking
1. Holding a map and asking someone for directions				
2. Applying for a bank account				
3. Inviting a friend to an event				
4. Conducting a questionnaire/survey				
5. Your example:				
6. Your example:				
7. Your example:				
8. Your example:				

Content Based Instruction (CBI)

Content-based instruction (CBI) involves the studying of some specific subject-matter content in combination with the learning of a second or foreign language. The target language is the medium which is used in order to convey informational content of interest and

relevance to the learner. CBI enables students to acquire both practical knowledge as well as language skills, which becomes more relevant to students' long-term goals, which in turn fosters their intrinsic motivation. For example, in a history, science, or literature course, the students would be learning subject-specific material pertaining to the course as well as engaging in language skills objectives such as developing their reading strategies and their vocabulary, and their grammatical and writing skills through the context of the content itself. There are many topics that can be considered 'content'; what is important is that what is being taught or discussed through the content leads to opportunities for language development as well, promoting student engagement and intrinsic motivation.

Theme Based Instruction

Theme-based or topic-based instruction is considered a more specific form of content-based instruction, as it places an equal value on both content and language objectives. Language skills are enhanced through attention to both topic and language. The rationale is that language is used to explore a particular theme, and language growth emerges as students need to comprehend or produce language related to that theme. In theme-based instruction, many different activities are linked together by their theme, so the topic is frequently addressed through everything that happens in the classroom, and it acts as a connecting thread for the students.

An example course for pre-university students might focus on topics of current interests/themes such as public health, multiculturalism or any societal trends. English for specific purposes (ESP) is an example of theme-based instruction, as it caters to specific learners' needs on a particular topic such as Business English, Legal English, or Medical English, and the students focus on learning content and terminology pertaining to that topic while also developing their linguistic skills.

ACTIVITY 3	Imagine you are teaching the past verb tense to your students. Brainstorm and write down 5 content subjects, topics, or themes that are related to your target language that you could use to practice this grammar concept (i.e., Teaching about a historical event).
ACTIVITY 4	Pretend that in your classroom, the new theme you are focusing on is "Social Media." Create an outline of a lesson on this theme that integrates the students' use of at least 3 language skills.

Task Based Instruction

Task-based instruction involves the centrality of the task itself in a language course. This implies that meaning is primary, communication must be employed for the purpose of

engaging in the task, there is some relationship to comparable real-world activities, and task completion typically has priority. Task based instruction focuses on a variety of real-world tasks and the functional purposes for which language needs to be used. Course goals tend to center on learners' pragmatic language functions. For example, in a task-based lesson or activity, students might be asked to conduct an interview, collaborate on possible solutions to an issue in their community, or simply participate in creating a class presentation. The following criteria (Willis and Willis, 2007) should be included in order for an activity to be considered a meaningful task:

- The activity or task should engage learners' interests
- The primary focus should be on meaning
- There should be a goal or an outcome and effectiveness of the task should be judged in terms of the outcome
- The activity should relate to real-world activities

An example task-based activity you could use with your students is having them think of a city where there is too much pollution. In pairs, students should list three alternative solutions to this problem. With their partner, they should compare the advantages and disadvantages of each alternative. Then the students should discuss and decide which alternative would be the most cost effective, the most innovative, and the most environmentally friendly. Finally, the students should report their decisions to another pair and have a whole class discussion on which solution would be the best one to write a letter about to the mayor of the city.

Experiential Learning

In experiential learning, one learns best by "doing," in which inductive learning activates strategies which enable students to monitor their own learning progress and gradually become more independent learners. Experiential learning places an emphasis on the psychomotor aspect of language learning, and through action, students utilize multiple skills. For example, the language experience approach (LEA), is a relatively popular type of experiential learning approach in elementary school teaching. The language experience approach is a whole language approach that promotes reading and writing through the use of personal experiences and oral language. Beginning literacy learners relate their experiences to the teacher who transcribes them and writes them on the board for the students to visualize.

These transcriptions are then used as the basis for other reading and writing as well as listening and speaking activities. Krashen and Terrell 1983 (qtd. in Taylor, 1992) recommend two criteria for determining whether reading materials are appropriate for ESL learners: First of all, the reading must be at a comprehensible level of complexity and additionally, it should be interesting to the reader. Reading texts originating from learners' experiences meet these two criteria because the degree of complexity is determined by the learner's own language, and the texts relate to the learner's personal interests.

ACTIVITY 5	Based on the above example, how might the activities integrate the four criteria listed by Willis? What types of language forms might the students need to be using during the task?
-------------------	---

ACTIVITY 6	Reflect on the four types of integrated skills instruction. Based on the grade, subject, and proficiency level of the students you are currently teaching or plan to teach, which of these types of integrated skills approaches would you implement for your classroom? Provide a brief example of how this type would be used for a lesson or activity.
-------------------	---

PRACTICAL TIPS FOR INTEGRATING THE LANGUAGE SKILLS

In order to effectively integrate the language skills in ESL/EFL instruction, teachers should consider these suggestions:

- Learn more about the various ways to integrate language skills in the classroom (e.g., content-based, task-based, or a combination).
- Reflect on their current pedagogical approach and evaluate the extent to which the skills currently are or could become integrated.
- Develop and use exercises and activities involving active student participation, interaction and collaboration.
- Choose instructional materials, textbooks, technology, and activities that promote the integration of listening, reading, speaking, and writing, as well as the associated skills of syntax, vocabulary, and pronunciation, for example.
- Even if a given course is labeled according to just one skill, remember that it is feasible and more beneficial to integrate the other language skills through appropriate tasks.
- Explicitly teach language-learning strategies and emphasize that a particular strategy can often enhance performance in multiple skills.

In addition to the aforementioned suggestions for teachers, students should have abundant opportunities to be exposed to the language in as many authentic mediums as possible. For example, students could listen to the new academic language of the lesson as the teacher uses visuals, manipulatives, realia, and other means to physically convey the meaning of the academic language. Since it is important to vary instruction and adapt it to multiple learning styles, students should also be able to see and read, for instance in posted graphic organizers or categories the new academic language. Furthermore, genuine learning is reinforced when students are provided with opportunities to practice and apply their newly acquired linguistic content; therefore, they should be encouraged to actually use the new academic language through active learning instructional activities. As another opportunity for students to reflect on their learning, teachers can facilitate tasks in which students write about what they have learned through expressive writing or answer questions using their very own words. Only

when students have been offered fully integrated listening, speaking, reading and writing instructional activities would they be able to provide sufficient evidence of learning the language of the content areas.

- Keep in mind that a language instructor needs to constantly use a combination of these two sets in order to properly enable his or her students to use language confidently and effectively. Depending on the purpose of each particular task or lesson, the instructor may concentrate more in-depthly on either the “accuracy” or the “fluency” set, but a combination from both categories can effectively be implemented into practically any lesson.

**SAMPLE INTEGRATED-SKILLS LESSON PLAN BASED ON THE NOVEL
*THE ALCHEMIST***

The following lesson has been developed based on Paolo Coelho’s novel, *The Achemist*. It includes pre-reading, while-reading, and post-reading activities, each integrating various language skills.

Pattison, 1987 (qtd. in Akram, 2010) identified two sets of teaching having opposing goals:

ACTIVITY 7	Study Pattison’s table below and design an activity that would combine at least 2 elements from both the accuracy and the fluency categories. What are some reasons for integrating components from both teaching approaches?
-------------------	---

Set 1	Set 2
Accuracy	Fluency
<i>Knowledge</i> about language	<i>Skill in using</i> language
<i>Academic</i> achievement	<i>Social and personal</i> development
Cognitive aims	Affective aims

- 1) *Pre-Reading*: Write-Pair-Share: Think about 1-2 proverbs from your culture, write them in your notebook, and pair with another student to discuss the implied meanings and contexts associated with your proverbs. (Use of skills: writing, listening, and speaking)

- 2) *While-Reading*: Read the excerpt below from Paolo Coelho's *The Alchemist* and highlight any words or sentences containing references to hardship or the testing of one's courage.

Infer and discuss the possible meanings of the proverb "The darkest hour of the night came just before the dawn." (use of skills: reading and speaking)

"So, what should I do now?" the boy asked.

"Continue in the direction of the Pyramids," said the alchemist. "And continue to pay heed to the omens. Your heart is still capable of showing you where the treasure is."

"Is that the one thing I still needed to know?"

"No," the alchemist answered. "What you still need to know is this: before a dream is realized, the Soul of the World tests everything that was learned along the way. It does this not because it is evil, but so that we can, in addition to realizing our dreams, master the lessons we've learned as we've moved toward that dream. That's the point at which most people give up. It's the point at which, as we say in the language of the desert, one 'dies of thirst just when the palm trees have appeared on the horizon.'

"Every search begins with beginner's luck. And every search ends with the victor's being severely tested."

The boy remembered an old proverb from his country. It said that the darkest hour of the night came just before the dawn.

- 3) *Post-Reading*: Free-write about a time when you were faced with an obstacle or difficult challenge and what measures you took to overcome it. Were you successful? What lessons did you learn? (use of skills: writing)

ACTIVITY 8	Read the following passage and design: 1) a pre-reading activity integrating the listening and speaking skills and 2) a post-reading activity integrating the writing and speaking skills.
Richard Brautigan, "The Scarlatti Tilt" "It's very hard to live in a studio apartment in San Jose with a man who's learning to play the violin." That's what she told the police when she handed them the empty revolver. (from <i>Revenge of the Lawn: Stories 1962-1970</i>)	

CONCLUSION

This chapter has provided an overview of the rationale for implementing an integrated skills approach within a language-learning classroom. It is safe to assume that most language teachers desire to promote genuine learning - the ability for students to actually use the language and to interact with a reasonable degree of fluency as well as accuracy. However, despite many teachers' efforts, learners often leave school "knowing" a lot of grammar and vocabulary but unable to speak with confidence. They can construct sentences, read texts relatively well and even pass exams, but cannot effectively manage situations which require spontaneous spoken interaction. It is important to emphasize skill integration and meaningful communication through contextualized, theme-based, whole-language approaches so that learners may use higher-level skills rather than simply focusing on discrete language structures. Integrating the language skills also promotes the learning of real content, not just the dissection of language forms. More importantly, the integrated-skill approach, whether found in content-based or task-based language instruction or another form, can be highly motivating to students of all ages and backgrounds.

Chapter 67

USING LITERATURE TO TEACH LANGUAGE SKILLS

Aşkın Haluk Yildirim*

İzmir Katip Çelebi University, School of Foreign Languages, İzmir, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. have comprehensive background information on the use and benefits of using literature in EFL/ESL settings.
2. be informed about the practical uses of literature in teaching mainly four basic language skills.
3. be familiar with the ways of assessing the appropriate use of literature in different EFL/ESL settings.

STUDY QUESTIONS

1. Discuss the possible pros and cons of using literature for language learning purposes.
2. In what ways do you think literature can serve as a tool to teach different language skills?
3. Compare and contrast the efficacy of traditional classroom materials and works of literature in terms of the means they provide in teaching a foreign/second language.

INTRODUCTION

Using literature to teach language skills has been a matter of discussion since the 1960s. However, the use of literary works to teach languages dates back to a much earlier period.

* Corresponding Author Email: ashalukyildirim@yahoo.com.tr.

During the 19th century the primary means of language teaching was the grammar translation method. The practitioners of this method would view and exploit literary texts as rich sources of translation. During this period works of literature were regarded as efficient pedagogical materials (Prodromou, 2000). Through the translation of literary texts in their mother tongue, the students were made to practise such language skills as grammar and vocabulary (Liaw, 2001). However, the onset of direct and audio-lingual methods during 1960s and 1970s brought about a radical change of opinion as to the use of literature as a language teaching tool. These methods that seemed to rise upon structural approaches put heavy emphasis on form thereby dismissing the role of literature in teaching a foreign language. From this point onwards purely linguistic concerns overshadowed the use of literary works for language teaching purposes. Even the emergence of CLT in the late 1970s and early 1980s could not prevent the exclusion of literature from the language teaching curricula. According to Maley (2001), one of the main reasons of this trend against the utilization of literature as a pedagogical tool was the lack of empirical research that would manifest the potential of literature as a beneficial language teaching source. Following a long period of silence, the use of literature in the language classroom experienced a revival starting from the middle of the 1980s. Under the influence of communicative trend, literature started to be regarded as a tool to assist the development of mainly communicative competence as well as “a springboard for the development of critical thinking and aesthetic appreciation” which also contributes to the students’ awareness on the culture and society of the relevant country (Bretz, 1990, pp. 335-338). Recognizing their potential, many linguists began to view literary works in the classroom as authentic, pleasurable and cultural material (Hall, 2005, pp. 47-57). Since this reemergence of literature in the realm of language teaching, not only the use of literary works but also research, both empirical and theoretical, as to their role in language teaching has gradually gained momentum. Today, particularly the popularity of interdisciplinary studies has brought about an even greater focus on the pedagogical potential of literature particularly for language teaching purposes. Despite the difficulties of incorporating literary works in ELT curriculum, works of many scholars in the field strongly argue for the benefits that inclusion of literature would potentially bring. Many studies conducted by Lazar (1993), Cook (1994), and Shanahan (1997) draw attention to the potential that literature holds as a language teaching tool.

Despite the concerns stated by a few linguists and educators, there has been a great deal of research that speaks in favor of literature as a pedagogical tool. Bradford (1968) introduces three ways through which works of literature are likely to be conducive to success in language teaching. First of all, literature provides a rich of source of vocabulary for the language learner. The second contribution of literature according to Bradford is the exceptional sentence structures that it hosts. Getting familiar with these structures in authentic settings is an advantage for language learners. Povey (1972) holds a similar view asserting that with its rich vocabulary pool and complex syntactical patterns literature helps language learners develop the extent of their proficiency levels both in terms of language use and linguistic competence. Finally, literary works introduce new cultural perspectives and give the chance to have a language experience in real life settings. As McKay (1982) states literature can be used to enhance awareness of students as to the diverse uses of language. Another important contribution of literature to language learning is regarded as its effect on critical thinking skills of students. Oster (1989) suggests that literature provides students different perspectives, which in turn extends students’ vision and encourages critical thinking.

Lazar (1993) draws attention to a similar potential by pointing out that literature might become a language teaching tool by fostering discussion, controversy and critical thinking. Another important benefit of literature is that through exposure to language intended for native speakers, students have the chance to learn different forms and conventions (Collie and Slater, 1991, p. 4). In this respect, literary works become real and meaningful models for language learners. One of the most detailed accounts trying to justify the role of literature in language teaching comes from Maley (2001), who lays out a number of reasons to use literary works in EFL/ESL settings: 1. Universality: All cultures and languages follow a certain literary tradition, which involve common themes such as nature, death, love and separation. 2. Non-triviality: Literary texts present real and meaningful materials unlike the artificial trivialized language teaching resources. 3. Personal relevance: the events, views and emotions embedded in literature are relevant to learners' own experiences, so they can find or imagine correlations to their personal lives in works of literature. 4. Variety: Literary texts appear in a multitude of different forms and contents. This makes them enjoyable and motivating for language learners. 5. Interest: Literature deals with familiar subjects in an interesting and appealing manner. 6. Economy and suggestive power: Through literary devices, literature has the power to say much with a minimum amount of expression. 7. Ambiguity: The perceived meaning in literary texts can vary from individual to individual, which makes it an invaluable source for discussion and interaction.

In today's text books students have little opportunity to be involved in authentic use of language. The settings and activities provided by these materials are mostly artificial and remote from real communication. Literature requires students to actively participate in meaningful activities and eliminates the disadvantages of mechanical process which is unfortunately still predominant in EFL/ESL classrooms worldwide. Duff and Maley (1991) bases the need for the incorporation of literature into language teaching curriculum upon its "linguistic, methodological and motivational" potential (p. 48). Unlike the referential features of traditional text books and materials, literary texts are representational, which helps learners to use and develop their cognitive skills (McRae, 1996).

USING LITERATURE TO TEACH LANGUAGE SKILLS

Literature is a rich source hosting numerous characteristics of original language which can serve a useful purpose for the development of reading, writing, speaking and listening skills (Stern, 1991). Literary texts supply diverse linguistic input and creative stimuli that engage students in meaningful, real life settings thereby becoming an effective source of motivation. They appeal not only to receptive but also to productive skills. Today, the use of literary works in the language classroom can turn into an amazing learning experience. These texts can become even more attractive and motivating by the support of movies, music videos, audio texts and podcasts. Along with the mastery of grammatical patterns and new vocabulary items, literary texts provide opportunities for extensive practice in all four basic language skills.

Works of literature can both be used for classroom activities and for activities outside the classroom. Simplified and abridged versions of literary texts enable their use for all proficiency levels. Genres of literature that we can use as a pedagogical resource in the language classroom are novels, plays/drama, short stories, poems and songs.

GENRES OF LITERATURE USED IN TEACHING LANGUAGE SKILLS

Novels

Why Use Novels

Novels are potentially rich sources of literature that may be used for language teaching purposes. They may be beneficial either as an intensive or extensive means of study. Widdowson (1984) suggests that novels contribute to “meaning making processes and language capacity in our learners” (p. 246). From a similar perspective, Hardison and Sonchaeng (2005) notes that the texts offered by novels are more meaningful and students have the chance to be exposed to “authentic communicative events” instead of the monotonous dialogues practiced in most EFL/ESL classes (p. 594). Compared to traditional classroom texts, most of which offer mechanical means of practice within a limited and largely artificial context, novels create a learning environment that enables the practice of a wide range of creative and life-like activities. The major concern regarding the use of novels in the classroom is that they may be hard to handle in the limited course hours. However, this is a drawback that can easily be overcome by careful planning. Provided that the teacher chooses the right material and plan wisely, the benefits of using novels will far outweigh the risks. Helton, Asamani and Thomas (1998) outline the possible benefits of using novels in the classroom as follows:

Novels,

- stimulate students’ imagination,
- help students to identify the emotions of the characters so that they can learn how others cope with situations and problems similar to their own experiences,
- help them master the skills that will enable them to acquire information, process this knowledge, identify problems, formulate alternatives, and arrive at meaningful, thoughtful, effective decisions and solutions,
- develop oral and written language skills,
- serve as a springboard for a multitude of holistic learning and critical thinking activities beginning with basic comprehension and writing,
- present a unique way of teaching reading by getting students involved and excited about the reading process,
- motivate students to become a lifelong reader, since literature provides students with a wide range of language varieties like sociolects, regional dialects, jargon, idiolects, etc., it develops their sociolinguistic competence in the target language. Hence, incorporating literature into a foreign language teaching program as a powerful source for reflecting the sociolinguistic aspects of the target language gains importance (pp. 1-5).

Target Skills

Novels can help students to improve all language skills. Although their benefits are mostly associated with reading and writing skills, novels with audio scripts, graphics, movies, theatrical adaptations can offer a much wider range of activities involving speaking and

listening skills. As Povey (1979) suggests that using authentic literary texts like novels for teaching purposes helps students improve all language skills "because literature will extend linguistic knowledge by giving evidence of extensive and subtle vocabulary usage, and complex and exact syntax" (p. 162). Of all the genres used as teaching materials, novels have the most extensive potential to contribute to different aspects of the language learning process provided that the material chosen fits into the needs and proficiency levels of the learners.

Role of the Teacher

During all language learning activities based on a novel the teacher should refrain from being the sole authority in the classroom. Whatever the type of the activity is, students should be allowed to learn by active participation. During the whole process, depending on the type of activity, the teacher may act as a guide, facilitator, organizer or prompter. The teacher only acts as a controller during the presentation stage if necessary.

Activity 1

Compare and contrast the potential difficulties and benefits of using novels as language teaching materials.

Drama

Why Use Drama

Drama is one of the most enjoyable literary resources that can be used in EFL/ESL settings. As Fleming (2006) maintains drama is by nature student-centered. It calls for the active participation of all students in activities conducted in the classroom. Through activities based on a work of drama learners can have the chance to act, move, play and learn simultaneously. As Phillips (2003) notes drama has the potential to get the students involved in various aspects, "through their bodies, minds, emotions, language and social interaction" (p. 6). On the other hand, the main practice of drama is acting out, which may be difficult to organize in crowded groups. However, the teacher can deal with this difficulty by arranging group work activities. Thus, this argument cannot be solely a reason to exclude drama from the language classroom as its gains are too valuable to be overlooked. Maley (2005) summarizes the educational benefits of drama as follows:

- It integrates language skills in a natural way. Careful listening is a key feature. Spontaneous verbal expression is integral to most of the activities; and many of them require reading and writing, both as part of the input and the output.
- It integrates verbal and nonverbal aspects of communication, thus bringing together both mind and body, and restoring the balance between physical and intellectual aspects of learning.
- It draws upon both cognitive and affective domains, thus restoring the importance of feeling as well as thinking.
- By fully contextualizing the language, it brings the classroom interaction to life through an intensive focus on meaning.

- The emphasis on whole-person learning and multi-sensory inputs helps learners to capitalize on their strength and to extend their range. In doing so, it offers unequalled opportunities for catering to learner differences.
- It fosters self-awareness (and awareness of others), self-esteem and confidence; and through this, motivation is developed.
- Motivation is likewise fostered and sustained through the variety and sense of expectancy generated by the activities.
- There is a transfer of responsibility for learning from teacher to learners which is where it belongs.
- It encourages an open, exploratory style of learning where creativity and the imagination are given scope to develop. This, in turn, promotes risk-taking, which is an essential elements in effective language learning
- It has a positive effect on classroom dynamics and atmosphere, thus facilitating the formation of a bonded group, which learns together.
- It is an enjoyable experience.
- It is low-resource. For most of the time, all you need is a 'roomful of human beings' (p. 1-2).

Target Skills

Drama can provide the means to practice all four language skills. Yet, mainly it is effective in developing listening and speaking skills. Apart from its contribution to oral skills, drama can also help students discover their potential and capabilities. Through activities of this type students are likely to develop a positive attitude towards language learning.

Role of the Teacher

Because drama activities are inherently learner-centered, the teacher should avoid having the dominant role in the class during these activities. Rather, the teacher needs to act as a guide and/or facilitator. Hoetker (1969) draws attention to this point by stating that "the teacher who too often imposes his authority or who conceives of drama as a kind of inductive method for arriving at preordained correct answer will certainly vitiate the developmental values of drama and possibly its educational value as well." A strictly teacher- centered attitude may seriously hamper the progress of the students expected to take part in drama activities.

Activity 2

Do you agree with the notion that drama can be more effective in teaching productive skills rather than receptive ones? Why or why not?

Short Stories

Why Use Short Stories

Of all literary genres, short stories are generally regarded as the most effective and employable teaching resource in the classroom. Poetry is found risky because of its metaphoric nature as well as nonstandard use of language, while novels, on account of their

length, may be hard to incorporate into the language teaching syllabus. Drama is also viewed as less suitable for teaching purposes than short stories on the grounds that acting out a play or a similar activity may be difficult to perform in a large student group. In this respect, Poe describes the short story as a narrative “that can be read at one sitting of from one-half hour to two hours and is limited to a certain unique or single effect to which every detail is subordinate” (as cited in Abrams, 1981, p. 76). Compared to novels in particular, short stories have a much easier plot for students to follow. They also contain fewer characters and less complex literary devices than novels. These and some other factors make them easier to incorporate into language curricula and syllabi. From a similar point of view Collie and Slater (1991) notes the benefits of short stories as follows:

- One or two class hours are generally sufficient to introduce a short story.
- Students can study on short stories without strict supervision or assistance because of their relatively simple nature.
- There are many types of short stories available that appeal to different tastes and interests.
- Finally, short stories can be utilized at all proficiency levels, beginner to advance (p. 196).

Target Skills

Just like novels, short stories can be used as effective teaching tools for all language skills. They can be good models for writing activities and their length allows the teacher to perform intensive reading activities within course hours. Today, there are numerous short story audio books, which can be used to perform listening activities. The dialogues in short stories and their simple story line provide a rich and practical source for communicative activities. Drawing attention to their overall benefit, Murdoch (2002) states that “short stories can, if selected and exploited appropriately, provide quality text content which will greatly enhance ELT courses for learners at intermediate levels of proficiency” (p. 9). Particularly for the teacher who sets out to use literary texts in his class for the first time, short stories may be a good option to begin with.

Role of the Teacher

Using a short story for language teaching purposes is probably the easiest among the other genres of literature. The teacher’s role as controller is normally limited to clarifying few literary devices and if needed a set of new vocabulary items. During the rest of the course hours the teacher acts mainly as an organizer. The activities based on the short story are carried out under his/her guidance with minimum amount of interference. When students encounter difficulties while performing the assigned tasks or roles, the teacher may also act as a facilitator by providing positive and encouraging feedback.

Activity 3

Short stories are believed to be the most appropriate literary works to use in EFL/ESL classrooms particularly at lower proficiency levels. Discuss the reasons in groups.

Poems and Songs

Why Use Poetry

In the realm of language teaching the definition of poetry covers a broader spectrum. For teaching purposes, pop-songs, haiku, pattern poems, picture poems, nursery rhymes and folk-songs can all be regarded as poetry. Poetry is generally viewed as the most difficult genre that can be used as a language teaching tool. Brindley (1980) argues that poems often deal with geographical or social settings remote to the students' experience. However, probably, the greatest barrier to understanding poetry is its elliptical, metaphorical, and highly allusive language. Poetry, from this perspective (i.e., as a high-level, individual reading activity), has little to offer the EFL classroom, especially at middle school and high school level (Brindley, 1980, p. 1). As Brindley states poetry presents many difficulties for EFL/ESL learners due largely to its metaphoric nature and irregular use of language. In view of these reservations, poetry has not been considered “as ‘proper’ material for foreign language learning” (Maley & Duff, 1989, p. 6). However, largely as a result of the changing tendencies in language teaching such as the shift from form-based learning to meaning-oriented acquisition and from product-oriented learning towards process-oriented learning, use of poetry for teaching purposes are now supported by many scholars. Some of the benefits of using poetry and/or songs in language teaching are as follows:

- Learning to read and write poetry can be an effective tool for developing English literacy, in that, from time to time it is used to express feelings in texts such as birthday cards, love letters. Understanding the meaning in a favorite song or just being able to utter its rhyme is almost a daily activity of many teenagers nowadays, which makes understanding poetry essential for the social aspect of language learning.
- Listening and pronunciation activities based on poetry or songs are not only enjoyable but also efficient in developing listening comprehension skills.
- Exposure to the sounds of poetry and songs increases the awareness and unconscious absorption of language patterns and vocabulary. Whereas the stylistic characteristics of a poem leave a trace on readers' eyes, the sounds of language such as the rhyme and rhythm in poetry and songs penetrate into the mind and enhance the language learning process (Maley & Duff, 1989, pp. 10-11).
- Poetry allows the formation of a safe learning community where learners gain the self-confidence to act without constraints and feel free from the fear of being ridiculed. In this way, “free communication can take place” among learners (Arnold & Brown, 1999, p. 10).
- Poetry can stimulate group discussions and activities,
- Carefully-selected English poems offer a wide range of themes that appeal to the interests and likes of learners since they supply them with “meaningful and memorable contexts for processing and interpreting new language” (Lazar, 1993, p. 17).

Role of the Teacher

Since poetry as a pedagogical tool is usually used for upper-intermediate and advanced learners, the roles of the teacher are more varied and challenging. The metaphorical nature of poems and songs often requires feedback or presentation from the teacher. The discussion sessions are generally stimulated and moderated by the language teacher so that students can perform the activities more efficiently. In order to trigger interaction through use of poetry in EFL/ESL classroom, depending on the difficulty of the text and level of students, the teacher may sometimes have to act as a controller and/or facilitator. As in the implementation of activities based on other genres of literature, teacher's role as organizer is essential from the beginning to the end of the teaching process.

Activity 4

Using poetry in the language classroom might require more effort than the other genres on the part of the teacher. Make up a to-do list for the teacher who wants to use poetry in the language classroom.

METHODOLOGICAL APPROACHES TO TEACHING LITERATURE

Below you will find a fairly detailed account of existing approaches and models developed by different scholars and linguistics. Although each of them is based on a theoretical assumption and has a contribution to make to language development, only some of them are actually appropriate for language teaching purposes in general.

The Critical Literary Approach

The main focus of this approach is on literary elements in the text. The students are required to be informed about the literary devices and peculiarities. Students taught through this approach should have intermediate or above intermediate language proficiency (Maley, 1989).

The Stylistic Approach

According to Maley, the characteristic of the stylistic approach better fits the requirements in a EFL/ESL classroom because it deals with literature as a text and analysis of language is given priority (Maley, 1989).

Language-Based Model

In this model, literary texts are mainly used for language development. From this perspective it resembles Maley's stylistic approach. Although literary merits of a work should not be totally ignored, the texts are viewed and studied in terms of the linguistic elements they involve (Carter & Long, 1991).

Literature as Content or Culture Model

In this model, literary materials serve as a catalyst that would make students familiar with the cultural notions of the language like the history, literary theories, theory of genres, and biography of the authors (Carter & Long, 1991; Lazar, 1993).

Literature as Personal Growth or Enrichment

The main purpose of teaching through Personal growth model is not to develop language proficiency but to create awareness as to the association of literary experience with the students' real-life experience (Carter & Long, 1991).

The Story Grammar Approach (SGA)

Story grammar originated in the early twentieth century as a result of the analyses of folktales by anthropologists. The Story Grammar approach aims to create genre-awareness in textual analysis, which in turn is expected to enhance comprehension of the target text (Amer, 2003).

Reader Response Approach (RRA)

In this approach, learners study literature as an end itself, not for language learning purposes.

Therefore, it is similar to Maley's critical literary approach (Amer, 2003).

New Criticism

New criticism generally focuses on the analysis of long texts from Old literature. It does not address learners' real language needs (Van, 2009).

Structuralism

Structuralism involves the utilization of linguistic and structural aspects of a text (Van, 2009).

Stylistics

This approach is based on the notion that studying the linguistic features of a literary text should lead to aesthetic experience (Van, 2009).

Reader-Response

In this approach the reader's interactions with the text result in the interpretation. In other words, the interpretation is achieved through the interaction between the text and the reader (Van, 2009).

Language-Based

Language based approach involves the use of literary texts for language teaching through activities such as cloze procedures, brainstorming, summarizing, jigsaw reading, etc. (Van, 2009).

Critical Literacy

Critical Literacy approach calls for in-depth analysis of literary texts. Students are supposed to discover and comprehend the underlying meanings in a work of literature so that they can reach critical awareness (Van, 2009).

Integrated Approach

Integrated approach is one of the most effective ways that can be adopted by language teachers willing to use literary text as a tool in EFL/ESL classrooms. It provides a coherent model through which all language skills are taught by incorporating a set of text-based, student – centered activities which as Collie and Slater (1987: 8) suggest “add fresh momentum into the teaching of literature by stimulating students’ desire to read and encouraging their responses”. Savvidou (2004) suggests a plan where the integrated teaching process is explained stage by stage:

Stage 1: Preparation and Anticipation

Stage 2: Focusing

Stage 3: Preliminary Response

Stage 4: Working at it – I

Stage 5: Working at it – II

Stage 6: Interpretation and Personal Response

Within the framework offered by Savvidou any literary genre can be used as a language teaching resource as long as the material chosen appeals to the needs, proficiency levels and interests of the learners.

Activity 5

Of all the above approaches and models, which one(s) do you think is/are likely to be effective in EFL/ESL classrooms. State reasons for your choice(s).

Activities

Among the activities listed below you can choose the ones that you think will be most appropriate for your group of students. You can also create your own activities or modify an existing one according to your needs. Some of the activities listed under a certain type of skill below may be used to teach different skills at the same time. For example, note-taking can be regarded both as a listening and writing activity. You decide which activity to use at which stage of your lesson plan with regards to your methodology, course objectives, the literary text, the needs and proficiency levels of your students. As it covers all language skills, adopting the integrated approach can help the students at all levels to get the utmost benefit out of the literary text that is being used as a pedagogical tool. The most common activities used to develop language skills are as follows:

Reading

- *Skimming*: skimming is reading rapidly to get only the main idea or a general overview of the text. It is a particularly useful activity in pre-reading stage.
- *Scanning*: scanning is reading the text for specific information. The teacher asks students to find out a specific point by reading the text quickly.
- *Making inferences*: students are asked to make inferences from a specific section or part of the text. The teacher wants them to identify what lies beneath the stated meaning.
- *Predicting*: After reading a fragment of the text, students are asked to make predictions about the rest of the story. This can also be used as a speaking activity.
- *Sequencing*: Students are asked to put, for example, lines from a jumbled poem in the correct order.
- *Previewing*: previewing activities are used to build background knowledge before reading the main text. Previewing can be achieved through charts, quizzes, movies, pictures or through other means created by the teacher.

Listening

- *Listening for the main idea*: Students listen to the texts focusing on the main idea of the literary text.
- *Note-taking*: Students listen and take notes. This can be used as a writing activity as well.
- *Summarizing the passage*: Students listen to the literary text or a fragment of the literary text. Afterwards, they are asked to make a summary of what they have heard. Summarizing phase might be written or spoken. Therefore, it is not just a listening comprehension activity. It can also be used for the development of speaking and writing skills.
- *Predicting content*: Students listen to a fragment of the literary text, after which they are asked to make predictions about the topic or story presented. As they also need to

talk about their predictions, this type of activity can also be used to practice speaking skills.

- *Listening for specific information:* Students listen to the literary text or a fragment of the literary text to identify specific information the teacher asks them to find out.

Speaking

- **Role Play:** Role-play is the general term for a set of activities in which students act out the role of an imaginary person either in a supposed or real situation (Venugopal, 1986). According to Livingston (1983) through role-play activities learners get the chance to practice language aspects of role-behavior, which involves the actual roles outside the classroom. Role Play activities are effective means of exploration for the students. Through these activities they can find out what lies beneath the complex social situations presented in a literary text (Blatner, 2002). Role play activities create an environment that is not only enjoyable but also productive. Most teachers, at some point in their career, experience the disappointment of asking their pupils to discuss a particular topic and get nothing in return. Assigning roles to the students makes them a part of the story and thus they become an actor rather than a spectator. In this way, they understand what it feels like to be on the other side (Wrentschur & Altman, 2002). The types of role-play activities are as follows:
 - Dramatic plays
 - Story dramatization
 - Sociodrama
 - Seminar style presentation
 - Debates and interview

As long as the literary text chosen is carefully graded, these activities can be used at all proficiency levels. From beginner to advanced role-play activities will contribute to the overall development of language proficiency.

- **Mime:** Mime can be defined as "a non-verbal representation of an idea or story through gesture, bodily movement and expression" (Dougill, 1987, p. 13). Students simply act out a story or an idea through bodily movements, gestures and mimics without resort to oral expressions. Mime helps students develop self-confidence, creativity and imagination. Used appropriately mime can be "a source of great enjoyment" for the learners (Hayes, 1984, p. 28). Feeling that they can even express themselves without the help of spoken language acts as a catalyst to produce and encourage interaction before or after the actual mime activity. As a warm up activity you may ask your students to act out a couple of concepts relevant to the actual literary text you intend to use. This would provide an insight and facilitate the process before going through the actual text itself.
- **Simulation:** Jones (1982) describes simulation as a "reality of function in a simulated and structured environment" (p. 5). Generally role-play and simulation activities overlap, that is, it is almost impossible to draw a clear line of distinction between the two. However, this doesn't seem much of a concern for the teacher as both groups of activities are likely to contribute much to students' progress in the target language. In

simulation activities students act out either themselves or an imaginary character in a predefined setting. For example, if you are teaching through a short story, a dialogue in a specific part of the story may be simulated by assigning roles to the students. The events may be arranged identically or in a different course. Oral activities in general may be practiced in various forms of dialogues such as invitations, introductions, complaints or greetings. The approach should be in parallel to the literary text that is being used as a pedagogical tool.

- *Improvisation*: Hodgson and Richards (1974) define improvisation as "spontaneous response to the unfolding of unexpected situation" (p. 2). During improvisation activities the teacher usually acts as a guide with minimum amount of directions. Improvisation takes place spontaneously. At the initial phase these types of activities may seem difficult for the students, most of whom would probably feel anxious and reluctant. However, in time as they discover their potential and capabilities, they will get involved more enthusiastically. Before beginning improvisation the teacher informs students about the setting they are in and the characters they are supposed to portray. The rest is entirely built upon students' imagination. For example, the teacher tells the students that they are a team of adventurers getting ready for a challenging journey in their base camp. Taking this information as their point of departure the students are free to create a world of their own, even something totally different from the actual story in the target literary text. These activities may be organized in groups or as a whole class activity.
- *Discussion*: students are asked to discuss independently a relevant topic or given clues to trigger discussion on a specific aspect of the issues in the literary text.
- *Oral reading*: Making the students read texts aloud helps the development of pronunciation. It is also a motivating activity particularly at low proficiency levels.
- *Presentations*: The students are assigned to make presentations on the topics relevant to the ones mentioned in the literary text.

Writing

- *Controlled Writing*: Controlled writing activities are particularly appropriate for beginners who need to recognize and practice certain grammatical patterns in the target language. Among the specific techniques used in this type of activity we can mention the following:
 - discussions
 - debates
 - brainstorming
 - asking information questions on the target text
 - clustering
 - conference
- *Guided Writing*: Guided writing activities are most effective when used at intermediate levels. In this type of activity students are generally expected to respond to a set of input provided by the teacher or his/her peers. For example, a group of questions may be directed to the students and they may be asked to reconstruct a text

through the answers of these questions. Another option might be to provide the topic and/or the concluding statement of a paragraph and ask them to generate the supporting statements. Most common techniques in this respect are as follows:

- Using a shared approach (Shared writing is a joint writing approach in which both tutor and learners contribute to the plan, the ideas, and the language of the text they construct together. As they work with the tutor to construct a text through shared (or guided) writing, learners brainstorm ideas, plan an outline, and draft a piece of writing for a particular purpose in a specific form.)
- Acronyms (Acronyms provide reminders of different text structures.)
- Templates (Templates provide an outline or prompts for a piece of writing.)
- Writing frames (Writing frames provide a skeleton or outline of a planned text that includes prompts for learner writers.)
- Reproducing the Model: Activities based on reproduction of the literary texts that are being used in the classroom help EFL/ESL students, particularly those at high proficiency levels, to improve their writing skills to a great extent. Paraphrasing, summarizing and adaptation are among the most beneficial and popular techniques used for this type of activities.
 - Paraphrasing (Students restate the meaning of a text or passage using their own words. During the restatement process students also need to alter the structures used in the original sentence.)
 - Summarizing (A summary is a collection of the most essential points of the original information in a nutshell. Students are instructed to write a summary of a chapter or the specific part of a novel they have read or heard.)
 - Adaptation (Students are asked to rewrite prose fiction into dialogue or, reversely, rewriting a play or a scene into narrative. This activity helps students to become aware of the variations between written and spoken English (Stern, 1991, p. 333).

SAMPLE LESSON PLAN

Course material: 'Everyday Use' by Alice Walker (Short Story)

Course Objectives:

- To develop reading, writing, speaking and listening skills of students through integrated activities based on the literary text,
- To create an awareness about racial discrimination.

Age group: 15-18

Proficiency Level: Intermediate

Duration: 2-3 hours (may change depending on the pace of the students)

Social Issue for discussion: racial discrimination

Literary devices: metaphors and symbols

Suggested Strategy: Integrated Approach

Warm-up (Suggested Activities)

- Drawing Game: Start with a drawing game. Choose the items you want them to guess from the story. (Suggestions: dasher, polaroid, quilt)
- Charade: Give students flashcards and ask them to pantomime what is written on the card. Try to choose the words that will be helpful while reading the main text.

Pre-reading Stage

Previewing: Establishing the necessary background knowledge

- Students watch a short video clip about American civil war.
- Pictures about Black Pride movement are shown so that students get informed about the setting and time of the story, all of which help them to understand the overall context.
- A brief biographical information about Alice Walker is given by the teacher

Prediction: Arousing interest

- Students try to make guesses about the content of the story by looking at its title. Tell them to make predictions considering the background knowledge they have just been given during previewing activity.
- Students watch a fragment of a video clip in which racial discrimination is introduced through a short drama. Afterwards, they are asked to guess what happens next in the clip. First, they write down what they think. Then, they speak about it.

Vocabulary in Context: teaching new vocabulary items

- Some of the key vocabulary items are presented in sentences and the students guess the meaning of these words. The sentences should not be taken from the text itself. If the students fail to guess the meaning of any vocabulary item, teacher gives a definition or provides more examples, similar words or pictures to make them guess or learn the meaning. (Suggested words from the story: furtive, recompose, doctrine, heritage)

While-Reading Stage

Skimming: reading for the main idea

Students read the story quickly to identify the main idea.

Model reading: Reading for pronunciation

The teacher model reads the story paying attention to pronunciation, intonation etc.

Silent reading: Intensive reading for details

Students read the passage silently paying attention to plot and characters.

Presentation: Helping students with language, vocabulary, plot and characters.

The teacher clarifies the meaning of passive vocabulary items and some grammatical structures for recognition if any. Cultural meanings, concepts or events are also explained if necessary.

The teacher helps students to have a deeper understanding of plot, characters and main theme(s) of the story.

Post-Reading Stage

Note-taking and summarizing: integrated listening and writing practice

Students listen to the audio version of the short story and take notes.

By making use of the notes they take, students write a brief summary of the story

Role Play: integrated writing and speaking practice

Students work in pairs/groups and write short dialogues based on the key actions or events in the story.

Students act out the roles of some characters from the story in the form of dialogues they write beforehand. (For example between Dee and her mother)

Discussion: integrated listening and speaking practice as well as work on narrative point of view

Students work in groups.

Students discuss the main theme of the story (Racial Discrimination), during which they ask and answer questions. The teacher acts as the moderator during the whole discussion session.

Activity 6

Design your own lesson plan based on any of the genres presented in this chapter making use of the suggested activities and the lesson plan sample presented above.

CONCLUSION

In this chapter, we focused on the use and role of literature in the language classroom. There is surely more to discuss as to why and how we can make use of literature as a language teaching tool. However, even the limited amount of information presented here clearly indicates the fact that works of literature have so much to offer in the EFL/ESL classroom. Such a rich source can help generate a much more effective learning outcome provided that the teacher is equipped with the necessary knowledge to use it pedagogically.

Lazar (1990) suggests that teachers who would like to use literature as a teaching tool should assess both the possible drawbacks and educational benefits along with linguistic opportunities (pp. 204-205). Using literature in the classroom has its risks as well as benefits. Teachers should be aware of both and take careful steps in order not to hamper the language learning process. Whatever the genre is, the material the teacher intends to use in the classroom should be in line with learners' needs and proficiency levels. The activities must be

designed to reveal the interactive, creative and motivating potential of literary texts so that students can have a more powerful learning experience than the one promised in traditional texts.

Although it may be difficult to build a curriculum in a particular sequence that is entirely made up of literary texts, works of literature can accompany textbooks in various ways and are potentially capable of contributing to the development of all language skills. For example, using a novel as a textbook might be too radical a decision unless there is a perfect match between the literary text and course objectives. However, using a novel to support and enrich classroom practice and activities may help the teacher immensely to achieve his/her goals.

Literature will help the practice of language in a meaningful context. Literary texts help students master both receptive and productive language skills. Teachers using literature for language learning purposes should be informed about the approaches and models they can use. Of all the approaches presented in this chapter, you can use the one that best suits your needs. However, in general it is advised that using an integrated approach will render literary texts and the learning outcomes produced through them much more efficient.

Chapter 68

USING TASKS IN LANGUAGE TEACHING

Gokce Bayraktar*

Kocaeli University, Faculty of Education
English Language Teaching Department
Izmit/Kocaeli, Turkey

THE GOALS OF THE CHAPTER

After reading this chapter, students will be able to:

1. Describe a task and the basic task cycles of Task-Based Learning and Teaching (TBLT).
2. Classify different types of tasks that should exist in a TBLT lesson.
3. Carry out analyses of TBLT activities.
4. Reflect about TBLT approach in relation to other approaches within the English Language Teaching (ELT) field.

STUDY QUESTIONS

1. How can we characterize a task?
2. What are the basic task cycles and classroom activities used during the in-class language learning period through task-based approach?
3. Which aspects of TBLT differ from the other approaches in ELT?

1. INTRODUCTION

Although Task-Based language learning (TBLL), also known as task-based language teaching (TBLT) or task-based instruction (TBI), is quite a popular term in ELT field, this

* Corresponding Author Email: gokcebayraktar@hotmail.com.

methodology do not seem to have a fixed definition. However, it can be defined in general terms as Foster (1999:69) suggests:

TBLL methodologies share a common idea: giving learners tasks to transact, rather than items to learn, provides an environment which best promotes the natural language learning process.

This method has become a corner-stone of many educational institutions and ministries of education around the world (Nunan, 2004: 13). This might result from the fact that it gives an emphasis on “means” rather than “product”. It has gained popularity as it also encourages learners to be reflective learners, and welcomes a wide range of learning styles. Learning with an explicit sense of purpose is key to student motivation and involvement and, thus it is consistent with current theories of education. Another reason for TBLL to be a keystone approach might be the fact that learning occurs most effectively when related to the real-life activities performed by the learner. Focusing on the use of authentic language and asking learners to do meaningful tasks such as visiting a doctor, calling customer service for help or conducting an interview, while using L2, this method enables students to investigate the language in a non-threatening environment and teachers to achieve initiating reflective learning and teaching.

2. THE MAIN ISSUES OF TBLL

a) What Is a Task?

Both the research and pedagogic literature provide various definitions of a task. These definitions address a number of dimensions: 1. the scope of a task, 2. the perspective from which a task is viewed, 3. the authenticity of a task, 4. the linguistic skills required to perform a task, 5. the psychological processes involved in task performance, and 6. the outcome of a task. (Ellis, 2003:2).

Kumaravadivelu (1993) lists a collection of “task” definitions as follows:

... one of a set of differentiated, sequencable, problem-posing activities involving learner and teachers in some joint selection from a range of varied cognitive and communicative procedures applied to existing and new knowledge in the collective exploration and pursuance of foreseen or emergent goals within a social milieu (Candlin, 1987:10).

... a piece of classroom work which involves learners in comprehending, manipulating, producing or interacting in the target language while their attention is principally focused on meaning rather than form. The task should also have a sense of completeness, being able to stand alone as a communicative act in its own right. ... When tasks are implemented in the classroom an observer of participants' judgment will determine the degree of completeness as much as the characteristics of the task itself (Nunan, 1993:59)

A language learning task is also about communication and its codes and conventions; its content can offer data on language and information about language. The content of language tasks can, therefore, be metacommunicative because its subject-matter is directly or indirectly about the means of communication and about the workings of language in use. A grammar exercise, a graded reading, or a written dialogue will serve to exemplify the workings of language by using messages to carry and reveal the code. Alternatively, a problem-solving task based upon a sample of target language in use may exploit the code as a means to involve the learner in interpreting and expressing meanings (Breen, 1987a:17).

... any structured language learning endeavor which has a particular objective, appropriate content, a specified working procedure, and a range of outcomes for those who undertake the task. 'Task' is therefore assumed to refer to a range of work plans which have the overall purpose of facilitating language learning - from the simple and brief exercise type to more complex and lengthy activities such as group problem-solving or simulations and decision-making (Breen, 1987b:23)

... for present purposes a task is taken to be an activity in which: i) meaning is primary; ii) there is some sort of relationship to the real world; iii) task completion has some priority and iv) the assessment of task performance is in terms of task outcome (Skehan, 1996:38)

An activity which required learners to arrive at an outcome, from given information through some process of thought, and which allowed teachers to control and regulate the process, was regarded as a "task" (Prabhu, 1987:24).

...a piece of work undertaken for oneself or others, freely or for some reward. ... In other words, by 'task' is meant the hundred and one things people *do* in everyday life, at work, at play, and in between. Tasks are the things people will tell you to do if you ask them and they are not applied linguists (Long, 1985:89).

...a piece of work or an activity, usually with a specified objective, undertaken as part of an educational course or at work (Crookes, 1986:1).

... a range of work plans which have the overall purpose of facilitating language learning - from the simple and varied exercise type to more complex and lengthy activities such as group problem-solving or simulations and decision-making (Breen, 1987:23).

b) Task Sequences

The figure below is a brief outline of a task-based class structure (Willis, 1996:52):

1. Pre-task: This serves as an introduction to the topic and task. This might involve brainstorming, a pre-task, introduction of useful words and phrases, preparation time or listening to native speakers doing the task. New structures are not pre-taught at this stage.

2. The Task Cycle: This cycle has three major stages and one further optional stage.

Task: Learners begin by fulfilling a communication task, using whatever language they already have, in pairs or groups. A task is a goal-oriented activity in which learners achieve a real outcome.

At this stage, the teacher monitors and encourages learners' attempts to communicate meaning in the target language. While helping them systematize what they want to say, the teacher does not correct errors. The emphasis is on spontaneity and fluency.

Planning: Learners prepare to report on the outcome after the completion of the task. The emphasis is on organization and accuracy later on. The teacher advises students on language and helps them correct any errors they make during this stage.

Reporting: Some or all of the groups report briefly to the whole class. The others listen in order to compare findings or to conduct a survey. The teacher may express things differently but not correct the language.

Optional post-task listening: This stage allows students to listen to native speakers do the same task and to compare the language.

3. Language Focus:

Analysis: Learners focus on form and ask questions about language features.

Practice: Teacher conducts activities based on the analysis work or examples from the text or transcript.

c) Task Types

According to Willis, (1996:26-28), there are six main types of task:

1. **Listing:** You can list people, places, things, actions, reasons, everyday problems, things to do in various circumstances. Examples: a) In pairs, agree on a list of four or five people who were famous in the 20th century and give at least one reason for including each person; can you remember your partner's busiest day? b) On your own, make a list of all the things he/she did. Then check with your partner. Were there any things you forgot?
2. **Ordering and sorting:** This can be sequencing, ranking or classifying. Examples: a) In pairs, look at your list of famous people. Which people are most likely to remain popular and become 20th century icons? Rank them from most popular to least popular, and be prepared to justify your order to another pair. b) Look at the four pictures. They are mixed up. Work in pairs. Put the four pictures in a sequence so that they tell a story. Prepare to tell your story to another pair.
3. **Comparing:** Comparison tasks can be based on two quite similar texts or pictures or places or events that learners have experience of. Learners can also compare their

own work with that of another learner or another pair or group. Examples: a) Compare your list of possible 20th century icons with your partner's list. Did you have any people in common? Tell each other why you chose them. How many reasons did you both think of? Finally, combine your two lists, but keep it to five people. b) Tell your picture story to another pair and listen to theirs. Compare stories – make a list of the main similarities and differences.

4. Problem solving: Text-books often contain activities based on common problems: pollution, relationships, noisy neighbours and so on. The instructions for the town center traffic problem in the example below incorporate six or seven ways of generating richer interaction:
5. -Think of a town center where there is too much traffic. In pairs, think of three alternative solutions to this problem. List the advantages and disadvantages of each alternative. Then decide which alternative would be the cheapest one, the most innovative one, the most environmentally friendly one. Report your decisions to another pair/group/the class, and discuss with them which solution would be the best one to put forward to the local government.
6. Sharing personal experiences: Activities where learners are asked to recount their personal experiences and tell stories are valuable because they give learners a chance to speak for longer and in a more sustained way. Besides it is something we often do in real-life. However, in order to encourage richer interaction, we usually need to add a clear goal, make instructions more precise and give clear completion points.
7. Creative tasks: Projects and creative tasks contain doing and reporting a survey, producing a class newspaper, planning a radio show, designing a brochure.

d) Other Task Types

Information gap, jigsaw and dictogloss activities are other task types of TBLT.

Information Gap Activities

Each student has information that the other student(s) don't have. The objective is for students to ask questions to find out what they can from the other(s).

Example

A's Information:

Person's Name	From	Occupation	Weekends	Movies
1. Jill (female)		doctor		romance
2.		professor	go fishing	
3. Jared (male)	Cincinnati			action
4.	Cleveland	banker	play cards	
5. Janet (female)	Dayton			

B's Information:

Person's Name	From	Occupation	Weekends	Movies
1.	Toledo		relax at home	
2. Jason (male)	Columbus			horror
3.		mechanic	play baseball	
4. Jenny (female)				drama
5.		lawyer	read novels	comedy

Sample Questions

What is the first person's name? How do you spell it? Where is he/she from? What is his/her occupation? What does he/she do on weekends? What kind of movies does he/she like?

After completing the chart, discuss with your partner:

Which person would you like as a friend? Why?

Dictogloss Activities

Dictogloss is a form of dictation, in which the students hear and reconstruct the whole text rather than doing so line by line. Dictogloss is useful in that learning becomes an active involvement and that it stimulates motivation, which can be used as a pre-reading activity, to present grammar and vocabulary, to name a few examples.

Steps:

1. Create a short text (4 to 5 sentences), that has the language item you will focus on, for instance “comparatives”, “would for past habits”, “personality adjectives”, etc.
2. Prepare students with a warm-up. Introduce the topic and pre-teach some vocabulary if needed.
3. After chatting about it for a few minutes, read the story twice at normal speed. The first time, they should not write anything but just listen. Remember to pause between sentences. Read it out the second time and ask students to note down the key ideas.
4. Have students reconstruct the story. Underline that the aim is not to write the story word for word, but to write the key ideas.
5. Students, then work in groups, compare their notes and try to reconstruct the text on OHT strips (you could have students write on the board if technology is not available).
6. Chose a volunteer group to display the story and ask other groups to give feedback, make necessary changes.
7. Finally, project the original text and ask students to identify any differences between the two texts.

8. Depending on the text and language, proceed accordingly. If it is for pre-reading purposes, ask them what they think the text could be about. If your aim is to present a language item, ask students to discover the rule, etc.
9. As a follow-up activity, students may write a similar text.

An example text:

“When I was a child we used to go camping every summer. We’d choose a different place each year, and we’d drive around until we found a beach we liked. Then, we’d pitch our tent, as near as possible to the beach. We’d usually spend most of the time on the beach or exploring the country round about. We never went to the same beach twice.”

Jigsaw Activities

In a jigsaw task, students work in pairs or small groups. They each have different information and they have to exchange their information so that they each have all the information. Often they then have to answer questions or do other tasks based on the complete information.

Example

A pair of students are each given a partially completed chart giving different information about three people – Tane, Pita and Moana. The information might be about where they come from, how many other people live in their house, how many pets they have, what their favourite sports are, and what music they like best. The students take turns to ask and answer questions regarding the three people without looking at their partner's chart. Both partners must request and supply missing information in order to complete all the details about Tane, Pita & Moana.

Open and Closed Tasks

Open and Closed tasks are minor types of tasks. Closed tasks are highly structured with specific goals and relatively predictable language forms. Open tasks are less structured with less specific goals and less predictable language forms. An example of a closed task would be the well-known information gap activity, in which, for example, two students determine whether they have the same picture. Students may not look at their partner's picture but must ask whether it includes a specific element. They take turns asking and answering questions. This task requires them to use the nonreferential *there* structure in questions and answers (e.g., Is there a chair in your picture? No, there isn't. Yes, there is.). It is communicative in the sense that the participants must use English to accomplish something, and it promotes an awareness of the form of nonreferential *there* sentences. A closed task is also collaborative, since two students work together to achieve successful communication.

The aim of the task based learning framework is to create the optimum conditions for language learning. Willis (1998:3) identifies these four essential conditions as:

- Exposure to the target language
- Opportunities to use the target language for expressing meaning
- Motivation to engage with exposure and use what they know
- Focus on language form to prevent fossilization

Here is a checklist that can help you work out if task based learning is achieved or not:

1. Does the activity engage learners' interest?
2. Is there a primary focus on meaning?
3. Is there an outcome?
4. Is success judged in terms of outcome?
5. Is completion a priority?
6. Does the classroom activity relate to real world activities?

3. SAMPLE ACTIVITIES

STRICT PARENTS

This lesson is taken from the book, *Doing task-based teaching* (Willis&Willis: 2007), but it is described in more detail here. The lesson is built around a discussion. The question for discussion is:

Whose parents were the strictest?

3.1. Introduction

You might lead into the discussion by telling students about your own childhood. Look at the student questionnaire below to give you some ideas as to what to include in this introduction.

3.2. Student Questionnaires

Here is a possible questionnaire to guide the student discussion. It is intended for discussion in groups of three or four. You may want to leave out some of the items. For example *c)* may be inappropriate in some settings. You may want to include other items, for example *Did you have to look after brothers and sisters?*

The questionnaire and the discussion were designed for an adult class who were asked to look back on their childhood. If you are teaching a high school class you may want to ask them questions relevant to their earlier childhood. Instead of *b)* for example, you might ask *What time did you have to go to bed?* Instead of *c)* you might ask *Did they let you stay overnight with friends?*

When you were a child:

- a) *Do you think your parents were strict or easy-going?*
- b) *Did they allow you to stay out late at night?*
- c) *Did they let you go on holiday on your own?*
- d) *When you went out did you always have to tell them where you were going?*
- e) *Did you always have to do your homework before supper?*
- f) *Did your parents make you help about the house?*
- g) *Did you have to help in the garden?*
- h) *What jobs did they make you do?*

You can vary the demands you place upon the class. With an advanced class you could begin by going straight into the questionnaire without further introduction. With a weaker class or an intermediate class you might begin with a teacher led discussion of each question. Here are some options you might consider going from least to most teacher support:

1. Go straight into the questionnaire without any further introduction.
2. Show students the questionnaire, give them two minutes or so to read through it, then ask them if they understand everything.
3. Show students the questionnaire then read through it with them explaining any possible difficulties.
4. As 3. As you read each question tell them briefly about your own experience.
5. As 4. At each stage after relating your own experience ask a student to tell you what they think.
6. As 5. Finish by adding a summary of what has been said.

If you go for option 1 this means that students will have to rely almost entirely on their own resources, although the fact that they will be working in groups will mean that they can help one another. If you go for a lower option, number 5, for example, this will give you an opportunity to help with the kind of vocabulary they might need.

You might want to make a list of new words down one side of the board.

You should not worry about grammar at this stage. Students will find their own ways of expressing the meanings they want. You may quickly rephrase some of the things they say to make them more comprehensible, but do not spend time correcting grammar and do not spend time at this stage on grammatical explanation or practice. That will come later (see 5 below)

3.3. Discussion

Put students into groups of about four and ask them to decide whose parents were the strictest. Tell them they can use the ideas in the questionnaire, but they may want to add to them. As they are involved in the discussion go round the groups listening to what they have to say. It is better not to correct students at this stage, but if they are having problems expressing themselves you might want to help out.

During the discussion you should appoint one student for each group as spokesperson. Their job is to report the findings of the group to the class as a whole after the discussion.

You may want to allocate other roles as well. One possibility is to make one student the group secretary. Their job is to take notes to summarise the discussion for other group members.

3.4. Post-Discussion

After the discussion give the groups a few minutes to brief their spokesperson before that person reports back to the class. Choose one or two of the groups and ask them to report. Ask the other groups to listen carefully and compare with the strictest parents from their own group.

After the discussion you may want to summarise what the groups have told you and to ask the other groups for their comments.

3.5. Language Focus

- a. Give students a copy of the questionnaire. Ask them to underline all the expressions about what people were forced to do and what they were allowed to do.
- b. Tell them to turn over their copy of the questionnaire so that they cannot see it. Show the following on OHT or PowerPoint, or give it to them as a handout:

When you were a child:

1. *Do you think your parents were ----- or ---- - -----?*
2. *Did they ----- -- stay out late at night?*
3. *Did they --- -- go on holiday on your own?*
4. *When you went out did --- always --- -- tell them where you were going?*
5. *Did you always ----- -- do your homework before supper?*
6. *Did your parents ----- -- help about the house?*
7. *Did you ----- -- help in the garden?*
8. *What jobs did they ----- -- do?*

- c. Ask them to work in pairs to fill in the blanks.
- d. Tell students to put their worksheets away. Put numbers 1-8 on the board. Ask students to work in pairs to see how many of the 8 sentences they can recall. You may want to make this recall exercise easier. You can do this by leaving a few key words in:

1. *Do you ----- parents ----- or ---- - -----?*
Etc.

Or you can give them a version of each sentence with all the grammatical words and markers removed:

2. *they/you/stay/late/night*

3. *they/you/go/holiday/own*

Etc.

You can ask them to pause after five minutes and listen, without writing, while you read the sentences out to them. They can then go back to work.

Students usually enjoy the challenge of this kind of exercise.

3.6. Controlled Practice

You may want to round off the lesson with some controlled practice. This will help to fix the forms in learners' minds, making it more likely that they will become a natural part of their productive repertoire. Here are two possible exercises practising *make* and *do*, and the verbs *force*, *allow* and *suppose* in the passive, which is how they are very frequently used:

Complete these to make true sentences:

1. When I was a child my parents ***made me***
2. They ***let me***
3. I was ***forced to***
4. I was ***allowed to***
5. I was ***supposed to***

Think about your schooldays...

1. List three things ***you had to do or were forced to do***.
2. List three things ***you weren't allowed to do***.
3. List three things ***you were supposed to do but didn't***.

As students read out their sentences you may want to incorporate listen and repeat drills.

After students have composed their sentences you can ask one or two of them to read out one of their sentences, then, after four or five ask the rest of the class to see how many sentences they can recall. You can make this easier for them by writing clues up on the board:

Miguel: Wear uniform

Juan: Homework

Maria: High heels

Students will then recall:

Miguel had to wear a uniform.

Juan was supposed to do his homework every night.

Maria wasn't allowed to wear high heels.

3.7. Follow-Up

You should try to follow up in a subsequent lesson within a week. With a general class you could remind them of the discussion and ask them to recall their conclusions in a teacher

led discussion. With an exam class you might follow this with a gap filling exercise or give a few multiple choice items which feature these grammatical items and reproduce the format of their exam.

Another possibility would be to have a skills lesson focusing on the same topic. Here are extracts from two interviews recorded by Tim Marchand, which you could use as the basis of a listening skills lesson:

- A. My Dad is a quiet man really, so he didn't really make me do much at home. He sometimes asked me to wash his car or cut the grass, but I was never forced to do it, and I could usually get some pocket money for it as well. I think my Mum was also pretty easy-going; she let me stay out late with my friends. As long as she knew where I was, she wouldn't mind so much what I did.
- B. My father was definitely stricter than my Mum. If I had been in trouble at school, it was always left up to him to tell me off. But I wouldn't say that my Mum was easy-going exactly. She would sit me down sometimes and make me do my homework in front of her, or force me to eat my greens, things like that. I guess I was just more scared of my father.

4. A SAMPLE LESSON PLAN

Robbery in a Sweet Shop

Tell learners that this lesson is based on a true story which was reported in *The Guardian* newspaper a few years ago. The first stage (steps 1 to 3) involves encouraging learners to speculate on the story on the basis of a few clues. At the next stage (steps 4 and 5) they make up their own stories to fit the clues. At step 4 learners should ideally work in pairs or groups, but if they are not used to this they could work first as individuals, perhaps making up their story for homework, and then get together in groups to share ideas.

At steps 6-9 they compare stories. At the end of this they should be keen to and/or hear read the newspaper story (step 10) to find out what really happened.

1. Write up on the board:

The Characters:

- A shopkeeper
- Her two children
- A young man
- An eight-year-old boy
- The police

The Setting:

- A corner shop in Ashton-under-Lyme, Manchester.

The Props (things used in the story):

- A balaclava
- A packet of Smarties
- A plastic bag
- A gun

Some phrases from the story:

A young man came in to buy a newspaper

He pointed a gun at her and told her to fill up the bag

I pretended to reach for some money

They are taking the case very seriously, like all cases which involve a firearm, fake or not

2. Explain some of the words and phrases which might cause difficulties. A *balaclava* is like a ski mask. It covers someone's face so only their eyes can be seen. *Smarties* are small brightly coloured sweets with chocolate covered in a thin layer of sugar. A *fake* is something which is imitation, which is not real.

3. Ask learners what they think happened in the story, but do not tell them if their guesses are right or wrong.

4. Ask them to try to guess what happened in the story. Tell them to use as many of the ideas on the board as they can. The best thing is for them to work in pairs or groups and discuss their ideas. This will give them a lot of speaking practice.

5. Tell them you are going to ask some of them to tell their stories to the class. Give them some time to prepare their stories. Go round and listen as they work.

6. When they have had enough time to prepare their stories appoint a spokesperson for each group. Ask the groups to work with the spokesperson to prepare the final version of their story.

7. Ask one of them to tell the story. Try to choose someone who thinks the young man is the robber.

8. Ask the others if their stories are the same or different. Choose someone who has a different story and ask them to tell it. Try to choose someone who thinks the eight-year-old is the robber.

9. Engage the class in a discussion as to whose story is the most likely.

10. Hand out the story for them to read. Or, if you want them to have some listening practice you can read the story out before they read it.

Eight-year-old tries to rob sweet shop.

Manchester police are looking for an eight-year-old boy who attempted to hold up a sweet shop last night in the suburb of Ashton-under-Lyme.

The boy, who was wearing a balaclava, went into the corner shop and bought a packet of Smarties for 25p. As the shopkeeper gave him his change a young man came in to buy a newspaper. The boy waited until the man had gone then threw a plastic bag at the shopkeeper. At the same time he pointed a gun at her and told her to fill up the bag.

“I’m not sure whether he wanted me to fill it with sweets or with money,” said the shopkeeper, who did not want to give her name. “I didn’t know if the gun was real or not, but it certainly looked more real than the guns my little boy plays with. I was quite frightened because I had my children with me. I pretended to reach for some money, but I pressed the alarm instead. When it went off he turned and ran out of the shop.”

She described the boy as 1.2 meters tall, and dressed in jeans and a dark coat. The police are asking the public to help. They say they are taking the case very seriously, like all cases which involve a firearm, fake or not.

4.1. Language Work

4.1.1. Identification

Ask learners to underline all the phrases with *to*:

tries to rob sweet shop; attempted to hold up a sweet shop; to buy a newspaper; told her to fill up the bag; whether he wanted me to fill the bag with sweets or with money; who did not want to give her name; I pretended to reach for some money; asking the public to help.

4.1.2. Analysis. Ask Them to Look at These Patterns

PATTERN A

VERB	<i>to</i>	VERB
tries	<i>to</i>	rob
attempted	<i>to</i>	hold up
(not) want	<i>to</i>	give
pretended	<i>to</i>	reach for

PATTERN B

VERB	NOUN	<i>to</i>	VERB
told	her	<i>to</i>	fill up
wanted	me	<i>to</i>	fill
asking	the public	<i>to</i>	help

Look at these sentences. Are they pattern A or pattern B?

- I need to borrow some money.
- We need someone to help us.
- The boy ordered her to fill up the bag.
- We always had to get up early.
- Can you help me to carry these boxes?

4.1.3. Help Your Learners to Organise Their Knowledge of Verbs Followed by to

These are the commonest verbs with pattern A:

agree, appear, attempt, begin choose, continue, decide, expect, forget, happen, hate, help, hope, intend, love, live, learn, mean, plan, prefer, pretend, promise, refuse, remember, seem start, try, want, would like.

How many of these verbs are to do with speaking?

How many are to do with thinking?

Can you find other words in the box which mean the same as: *appear, attempt, begin, intend, like, want*?

These are the commonest verbs with pattern B:

advise, allow, enable, expect, help, intend, invite, mean, order, prefer, tell, want warn (usually warn someone not to), wish, would like.

Can you find eight words that are also used with pattern A?

How many words are to do with speaking?

How many words are to do with wanting or liking?

4.1.4. Practice

Lead class discussions based on this:

Choose **either**:

- Three things you *want/would like* to do over the next year.
- OR
- Three things you *hope/intend/plan to do* over the next year.

Write down the three things in your book. Close your book. See How many things you can remember.

You can listen to a few sentences before learners close their books, then make sure they all have their books closed and lead a class discussion about what people want to do and about what they hope to do. These sentences will generally be pattern A.

Lead more class discussions based on this:

Choose **either**

- Three things your teacher *doesn't allow you to do* in class.
- OR
- Three things you *would like someone to give you*

Write down the three things in your book. Close your book. See how many things you can remember.

Again you can listen to a few sentences before learners close their books, then make sure they all have their books closed and lead a class discussion about what people want to do and about what they hope to do. All these sentences will be pattern A.

4.1.5. Round-Up

Ask learners to read the story for homework and be ready to tell the story next lesson. It is useful to build up a repertoire of stories so that in future lessons you can ask learners *who can remember the story about ...* and ask them to tell one of the stories that they have studied. This is a good way of getting them to remember the useful language they have encountered.

4.1.6. Vanishing Words

- a) Take a sentence from the text. For example:

As the shopkeeper gave him his change a young man came in to buy a newspaper.

- b) Write the full sentence on the whiteboard¹.
c) Ask one or two learners to read it out.
d) Rub out two or three words:

___ the shopkeeper ___ him his change a young man came in ___ buy a _____.

- e) Ask learners to work in groups of three or four. Tell them to work as a group to recall the sentence. Ask a learner to recall the sentence. Ask the class if the recall is correct. If they are not satisfied, they can go on guessing until they are content.

- f) Remove more words:

___ the shopkeeper ___ ___ his _____ a _____ man _____ in ___ buy a _____.

- g) Repeat e).
h) Go on until you have removed all the words.

You can make this activity more difficult:

1. By choosing a more complex sentence:

Manchester police are looking for an eight-year-old boy who attempted to hold up a sweet shop last night in the suburb of Ashton-under-Lyme.

2. By removing several words at each stage:

Manchester _____ are _____ for an eight-year-old boy _____ to hold up a _____ shop last night in the _____ of Ashton-under-Lyme.

¹ You can use Power point very effectively for this activity if you have the facilities.

3. By asking learners to work in pairs or individually instead of groups of three or four.

CONCLUSION

Having examined the task-based instruction method briefly, including some definitions, types, sequences and implementation of tasks, the subject of this chapter, it is appropriate at this stage to review the study questions and to consider how TBLL differs from the other approaches in ELT.

Task-based language learning method contradicts with the teacher-controlled and linear approaches, and do not support transferring information, but developing skills and strategies. It seems to offer an understanding of a complete body of language learning. For this reason, learning can be seen as a shared action, in which a great deal of negotiation between the teacher and learners can easily be observed. It can be deduced that TBLL offers action whereas other approaches are relatively low in action. As a learner-centered method, TBLL draws on the learner's knowledge, and therefore course materials are selected on the basis of both their needs and interests.

Still and all, when considering TBLL it is significant to work out the context in which it is to be used, and also the feedback of the learners. Such questions like "Are the learners familiar with the methodology?", "If not, are they willing to accept a methodology that is alien to them?" will probably be useful. Accordingly, negotiation with learners, so as to make sure that they are pleased to learn through this method, can motivate the learners to become involved in the process and the approach. It is therefore vital for teachers to take into account their teaching environments and apply this new approach sensitively.

As Vygotsky (1986:99) states, "the English teacher can provide the appropriate learning experience for the appropriate student at the appropriate time, by promoting awareness (and acquisition) of learning strategies, by encouraging learners to investigate the language through meaningful interaction in a non-threatening environment, and by initiating reflective self-evaluation".

VOLUME 6

Chapter 69

COGNITIVE LINGUISTICS IN THE YEAR 2010

Laura A. Janda

Universitetet i Tromsø, Norway

ABSTRACT

Cognitive linguistics emerged as a movement in the mid-1980s. Although in some sense it represents a new direction for linguistics, cognitive linguistics also builds upon venerable traditions, re-connecting the discipline with its past rather than severing ties and striking off in a revolutionary direction. Originally inspired by work by psychologists on the structure of human categorization in the 1970s, cognitive linguistics has maintained its commitment to psychological and neurological plausibility. Cognitive linguistics views linguistic cognition as indistinguishable from general cognition and thus seeks explanation of linguistic phenomena in terms of general cognitive strategies, such as metaphor, metonymy, and blending. Grammar and lexicon are viewed as parts of a single continuum and thus expected to be subject to the same cognitive strategies. Significant developments within cognitive linguistics in the past two decades include construction grammar and the application of quantitative methods to analyses.

Keywords: history of cognitive linguistics, radial category, prototype, metaphor, metonymy, blending, construction grammar, quantitative analysis

PREAMBLE

Ten years ago I was asked to write a position piece on cognitive linguistics for Slavists. It was the year 2000, and, like scholars all across the disciplinary spectrum, Slavic linguists felt the urge to revisit past achievements and assess future challenges. The major intellectual issue of the day was negotiating the available linguistic theories, and preventing adherents of opposing camps from backing so far away from each other that communication was cut off. My job was to write an article that would open a door to cognitive linguistics for my colleagues.

The original article had two strokes against it: it was targeted to the narrow audience of linguists working on Russian and closely related languages, and it was never published in print form. But despite these facts, this article became the most widely read and quoted piece in my list of publications, serving as the introductory article in university courses on cognitive linguistics. In its present form, this article has been refocused to address not just Slavists, but all linguists, and indeed all people interested in how languages work. I thank IJCL for the opportunity to revisit this article and to publish it in a print volume.

In addition to addressing a wider audience, the present article describes significant developments that have taken place in our field in the course of the past decade, integrating them into the discussion of cognitive linguistics in general. These developments include the blossoming of construction grammar and increased focus on empirical methods. In addition, there has recently been more attention paid to cognitive linguistics by scholars working in related fields such as psychology, typology, and robotics.

Although this article is intended as an introduction to the field, it is also a personal story. I was tremendously lucky to get involved with cognitive linguistics before any of us really knew what it was or what would become of it. In 1982, at the prompting of a visiting Bulgarian lecturer, I wandered into a presentation on metaphor by George Lakoff at the UCLA business school (in those days his ideas were not welcome in a linguistics department). By the end of the talk, I knew that I would use Lakoff's model to analyze the Russian prefixes I was struggling with. This chance event led me to write one of the first dissertations in cognitive linguistics. But you will not find the term "cognitive linguistics" anywhere in my dissertation, since it had not yet been coined. The only existing literature at that point were Rosch's (1973a-b, 1978; Mervis and Rosch 1981) works in psychology, plus some linguistic studies inspired by Rosch (Fillmore 1975, 1978, 1982; Kay and McDaniel 1978; Coleman and Kay 1981; Lakoff 1977). Lakoff and Johnson's (1980) *Metaphors We Live By* was a novelty then, and Ronald Langacker generously gave me a draft of his *Foundations of Cognitive Grammar*, which was published in two volumes five and eight years later. I very literally had the good fortune of being in the right place at the right time, and of meeting the right people who helped me out at a critical moment in my career. This account is entirely autobiographical, one person's view of how our field has evolved and where it is now.

1. INTRODUCTION

A curious thing happened to me in the 1990s. For several years, I had been teaching a course in cognitive linguistics at the University of North Carolina. A graduate student from the linguistics department who had taken my course in cognitive linguistics six years earlier came and knocked on my door. The son of a famous German linguist, with all the benefits of both European and American educations, this young man was unusually erudite and a pleasure in class because of the comparisons he could draw among linguistic traditions. Still, it was evident that he had been politely sitting through the course in order to chalk up a required elective; he clearly felt no affinity toward the subject matter.

Suddenly he reappeared, tremendously animated, speaking so fast I could barely follow him. His dissertation, an analysis of resultative constructions, had run into a series of dead-

ends, eventually exhausting all the syntactic theories available, and, despite himself, everywhere he looked he was seeing semantic prototypes and their effects. Then came the confession:

“I never really thought I would take cognitive linguistics seriously.”
I could only smile and reply, “Welcome back.”

Fortunately I had just returned from a biennial meeting of the International Cognitive Linguistics Association with a treasure trove of handouts and email addresses, so I was able to bring him up to date on the latest relevant achievements and put him in contact with key scholars.

A few days later he came back to thank me; his dissertation was now off and rolling again. In the intervening years, this former graduate student, Hans C. Boas, has completed his dissertation, achieved tenure as Associate Professor of Germanic Linguistics at the University of Texas, and become a leading scholar in construction grammar.

With some variations, this is a scenario I’ve been a party to several times before. My own dissertation was a problem in search of a framework almost two decades ago, when quite by accident I stumbled upon an embryonic movement without even a name or a bibliography. Yet the concepts were so compelling and the model so useful, that I have never escaped their attraction, and gave up trying long ago.

1.1. Some History

It wasn’t an easy birth. Initially viewed as a “soft and fuzzy” California intruder, cognitive linguistics was not warmly embraced by mainstream American linguistics. During the early years, abstracts using the framework were routinely rejected from LSA programs, grant proposals were sidelined, our book series was shunned by Oxford U Press, and even as recently as the 1990s, cognitive linguists were still being denied tenure on the grounds that their work was “too controversial” or “could not be considered linguistics at all”. Yet what began in the early eighties as a wedding of intuitive data analyses (Brugman 1988, Casad 1982, Lindner 1981) with powerful linguistic concepts (Lakoff and Johnson 1980, Langacker 1987 and 1991a), by 1989 had grown into an international organization (<http://www.cognitivelinguistics.org/>) with its own journal and book series. Today the International Cognitive Linguistics Association has nearly 450 members, and over 500 registered for our most recent biennial international conference. Over a dozen affiliate organizations have sprung up, representing North America and nations across Europe and Asia, and most of these organizations also boast their own conference and publication series.

2. RELATIONS TO OTHER DISCIPLINES

The original impetus for cognitive linguistics came from the pioneering research of psychologist Rosch (1973a, 1973b, 1978) on the nature of human categorization. Throughout its history, cognitive linguistics has maintained a lively dialog with allied disciplines such as

psychology, anthropology, neurobiology, motor control, artificial intelligence, philosophy, and literary criticism. ICLA meetings regularly include plenary lectures delivered by scholars from these other disciplines to foster cross-fertilization. These events invariably expose the many ways in which the conclusions of cognitive linguistics corroborate results obtained in a wide spectrum of academic inquiries. Cognitive linguistics is most certainly not an exotic endeavor off on its own disconnected tangent, but rather a framework that interacts responsibly with a community of academic allies.

Although this does not mean that cognitive linguistics can make any claim to psychological reality (diagrams are just artifacts, we do not presume that anyone actually thinks by means of such items), it does mean that cognitive linguistics strives in an informed way to create analyses that are at least psychologically (biologically, neurologically, etc.) plausible. Ultimately our responsibility as linguists to reflect what is known about human cognition by other disciplines is more important than any formal apparatus, however elegant, that might distract us from this goal.

The relationship between cognitive linguistics and psychology remains vital; a landmark in the dialog between cognitive linguists and psychologists is the 2003 volume edited by Gentner and Goldwin-Meadow, and Gibbs (1994) has provided a steadfast connection between our two disciplines.

Some of the most current evidence of how cognitive linguistics and psychology connect to each other can be seen in the works of Boroditsky (2001, 2003) and Casasanto (2008, 2009; Casasanto and Boroditsky 2008). Typology and language acquisition have been steady companion disciplines, due to shared appreciation of variation in language, as opposed to a quest for universals; Bowerman, Croft, Haspelmath, Levinson, and Tomasello (Bowerman and Choi 2003; Bowerman and Levinson 2001; Croft 1999, 2003; Haspelmath 1997a-b; Levinson and Meira 2003; Majid et al. 2004; Tomasello 1992, 2003) have all provided valuable cross-linguistic perspectives that support the framework of cognitive linguistics.

A recent reminder of the importance of typology to cognitive linguistics is Evans and Levinson 2009. In the past few years scholars in robotics have developed an interest in language evolution and have discarded modular, rule-based models for dynamic models of category acquisition (see Steels 2010 and more discussion in 4.4 below).

As we make our way along the path of cognitive linguistics, we have always been in good company, and the number of fellow-travelers seems to be waxing rather than waning.

3. RELATIONS TO OTHER THEORIES AND THE HISTORY OF LINGUISTICS

I've argued elsewhere (Janda 1993b, Janda 1999b; cf. also Geeraerts 1987) that cognitive linguistics gives us an opportunity to reconnect the threads of the history of linguistics and heal the gashes that marked our field in the twentieth century. This does not mean that cognitive linguistics is some sort of theoretical "throwback", a reinvention of tired old wheels already rejected. On the contrary, thanks to its continuance of time-honored intellectual pursuits (the form-meaning relationship, the coherence of linguistic and non-linguistic cognition, the assertion that language is the most immediate artifact of human thought, etc.), cognitive linguistics invites us to draw on the wealth of accumulated achievements in the

history of linguistics and move forward on this path, rather than bushwhacking off in some other direction. In many parts of the world, the path of cognitive linguistics is compatible with local theoretical frameworks. For example, during the Cold War era Eastern European linguists in general and Russian linguists in particular were largely isolated from theoretical discussions in the West, and turned their energies inward, developing their own home-grown traditions. The indigenous Russian Meaning<->Text framework and other semantic theories that emerged under these conditions are remarkably parallel to cognitive linguistics (cf. the assertion to this effect in Raxilina 1998), and as a result, cognitive linguistics is quite popular in Russia as well as in other Eastern European countries, particularly Poland, the Czech Republic, and Macedonia. Our colleagues in Western Europe have likewise been quick to embrace this framework, and cognitive linguistics is well-represented in the publications of linguists working in England, Norway, Sweden, Germany, and Austria. Representation in Japan has been strong throughout the 20-year existence of the International Cognitive Linguistics Association, and the past decade has witnessed the blossoming of our field in Korea and China as well. Consequently cognitive linguistics serves as an intellectual meeting place for linguists from various continents, facilitating discourse and collaboration.

4. BASIC CONCEPTS

Cognitive linguistics did not arise fully-formed from a single source, it has no central “guru” and no crystallized formalism. It is a concatenation of concepts proposed, tested, and tempered by a variety of researchers. The people whose work has been most influential in the creation of this framework include Brugman, Casad, Croft, Dąbrowska, Fauconnier, Goldberg, Johnson, Lakoff, Langacker, Lindner, Sweetser, Talmy, Taylor, Tomasello, Tuggy, and Turner; some of their classic works are cited in the references. This framework is anything but static. As it grows, cognitive linguistics continues to present us with fresh ideas and new means for interacting with other disciplines. A significant innovation in the mid 1990s was the study of blends (see 4.6 below). The late 1990s saw the advent of construction grammar (see 4.7 below). Since approximately 2000 empirical methods have emerged as core tools for analysis in the field (see 5.1 below), and recently robotic language evolution models based on radial categories and construction grammar have appeared (see 4.4 below).

The fact that cognitive linguistics can point to no definitive text or single authority does not mean that it is a trackless wilderness of shifting sands. There is a set of core concepts and goals, most of which are shared by most cognitive linguists, as well as by the philosophers, psychologists, and other scholars who have collaborated on the development of this framework. These concepts are not the product of an imposed theory, but have instead emerged from empirical observation corroborated across languages and disciplines. Rather than being a random hodgepodge, these concepts mutually support one another and have coalesced into a theory firmly grounded in fact. Overall, cognitive linguistics tends to lean more strongly toward data than toward theory, and it tends to expect that the latter can be gradually elaborated from the former. Early analyses of intricate arrays of natural language data performed by Brugman (1988), Casad (1982), and Lindner (1981) were formative in the development of cognitive linguistics, and the best research in this framework continues to use observations of data to tweak and refine the theory.

The above-cited ICLA website states that “[The cognitive linguistic] perspective subsumes a number of concerns and broadly compatible theoretical approaches that share a common basis: the idea that language is an integral part of cognition which reflects the interaction of cultural, psychological, communicative, and functional considerations, and which can only be understood in the context of a realistic view of conceptualization and mental processing.” In 4.1-4.7 I outline the most enduring and widely held concepts of cognitive linguistics. These concepts (and many more) are elaborated in more detail in Geeraerts and Cuyckens 2007 and a series of textbooks and collected volumes devoted to cognitive linguistics (Achard and Kemmer 2004, Croft and Cruse 2004, Dąbrowska 2004, de Stadler and Eyrich 1999, Dirven and Verspoor 1998, Langacker 2008, Rudzka-Ostyn 1988, Taylor 2002, Ungerer and Schmid 1996).

4.1. The Status of Linguistic Cognition

For a cognitive linguist, linguistic cognition simply is cognition; it is an inextricable phenomenon of overall human cognition. Linguistic cognition has no special or separate status apart from any other cognition. This means that we expect patterns of cognition observed by psychologists and neurobiologists to be reflected in language. Furthermore, the various phenomena of language are not cognitively distinct one from another. Although it is often useful and convenient for linguists to talk about various “levels” or “modules” of language, these distinctions are perceived by cognitive linguists to be artificial. The truth is that all the “parts” of language are in constant communication, and indeed are really not “parts” at all; they are a unified phenomenon operating in unison with the greater phenomena of general consciousness and cognition. Linguists have frequently observed that the borders between traditional linguistic phenomena can be crossed. Phonology, for example, can be affected by morphology, semantics, syntax, and pragmatics; and syntax has likewise been shown to be vulnerable to the workings of phonology, semantics, and pragmatics. The fact that these items are not pristinely discrete is perhaps not news, but for a cognitive linguist this type of evidence is expected, pursued, and focused on rather than being relegated to the status of something marginal and unimportant.

4.2. The Status of Meaning

All the various phenomena of language are interwoven with each other as well as with all of cognition because they are all motivated by the same force: the drive to make sense of our world. Making sense of what we experience entails not just understanding, but an ability to express that understanding, and indeed these two projects inform each other: our experience is formative to expression (see 4.4 below), but it is also the case that our expressive resources have some influence on how we perceive our experiences. Of course language does most of the heavy lifting (and the finer handiwork) in this job of expression that is so important to cognition. All phenomena of language are mobilized for this task, and all are therefore driven by the need to express meaning. Meaning underwrites the existence of all linguistic units and phenomena, none of which are semantically empty. Meaning is therefore not tidily contained

in the lexicon, but ranges all through the linguistic spectrum, because meaning is the very energy that propels the motor of language. Grammar is an abstract meaning structure that interacts with the more concrete meanings of lexicon. Grammar and lexicon are not two discrete types of meaning, but rather the extreme ends of a spectrum of meaning containing transitional or hybrid types (functor words like prepositions and conjunctions are examples of hybrids that carry both lexical and grammatical semantic freight). From the supra- and segmental features of phonology through morphology, syntax, and discourse pragmatics, all of language shares the task of expressing meaning. This includes even idioms and “dead metaphors”, which remain motivated within the system of a given language, and whose motivation can be made explicit¹

4.3. The Status of Prediction

Linguistics is a field with an almost desperate desire to be an exact science. Science and precision have unparalleled status in our society, for they command respect and authority. The operational definition of a scientific result hinges upon proving that the result can be repeated; i.e., it is predictable. The reality for linguistics is however very different from that of the physical sciences. Historical linguistics and dialectology provide plenty of evidence that even when you are starting from more or less the same place (or even exactly the same place) linguistically, you can end up with an amazing variety of results.² We have to face the fact that linguistics is really a field in which none of the experiments have adequate controls, there are way too many variables, and all the data is contaminated. It doesn't make much sense for us to depend entirely on the metaphor LINGUISTICS IS AN EXACT SCIENCE to structure our inquiry. As Croft (1999) has pointed out, if linguistic phenomena were truly predictable, there wouldn't be any variation, and variation is one of the best- documented phenomena we know.

By accepting these facts, cognitive linguistics neither disintegrates into a morass of arbitrary chaos, nor does it give up all aspirations to scientific inquiry.³ Cognitive linguistics does not subscribe to a strictly dualistic understanding of the concepts predictable vs. arbitrary or objective science vs. subjective interpretation. Just because a phenomenon is not entirely predictable doesn't mean that it is entirely arbitrary, and one should expect a dynamic relationship between data and interpretation. Cognitive linguistics searches for the motivations that drive linguistic phenomena, recognizing that sometimes several variants are

¹The case can be made that no metaphor is entirely dead; some are in a frozen state, but can be thawed out when desired, often in the context of humor. A regular feature in my courses on metaphor and cognitive linguistics is a homework assignment asking students to implement parts of a conventional metaphor that are usually not active to produce jokes such as “His ideas are so far out that even the Hubble telescope can't detect them”, or “I'm at the end of my rope! Could you hand me something longer, like maybe a bungee cord?” This task shows that even the metaphors underlying idiomatic expressions are not really “dead” – they can be reactivated and pressed into creative service.

²A historical linguist once pointed out to me that it is just as common to see a change in which A goes to B, as to see one in which A “just goes all to hell”. I can cite many examples from the history of the Slavic languages that corroborate this statement (e.g., *türt/trüt* reflexes and *jer* loss/vocalization), and surely linguists who work with other languages know of similar stories.

³Even the “hard” sciences are not immune to liberal application of “soft” interpretation. As often happens with folk theories such as LINGUISTICS IS AN EXACT SCIENCE, we apply a stripped-down version of the model, ignoring the subtler intricacies. We forget that the traditions of how to interpret data are often just as valid and venerable as the data themselves.

equally motivated, and the choice of which one succeeds is a language-specific convention that cannot be fully predicted. Though the motivations vary (and often a given phenomenon may be multiply motivated in the system of a given language), at an abstract level, these motivations yield a consistent pattern: all linguistic phenomena are meaningful; linguistic categories are radial categories with prototype effects; meaning is grounded in embodied experience and elaborated via metaphor, metonymy, and blends; construal determines how perceived reality is sorted into foregrounded and backgrounded information; etc.

Exploration of this pattern of motivations takes the place of a quest for “universals” in cognitive linguistics. Because cognitive linguistics is not in the business of prediction, it is also not looking for a set of concrete universals that would facilitate prediction (on the assumption that this is neither desirable nor realistically achievable). In the big picture, cognitive linguistics’ ultimate goal is to understand how human cognition motivates the phenomena of language, to be described in terms of abstract trends rather than air-tight, absolute rules. One could say cognitive linguistics recognizes that human beings are not rule-guided algorithms, but individuals with a free will which they exercise in ways not entirely consistent and predictable, but on the whole well-motivated and according to certain patterns.

4.4. The Embodiment of Meaning

Given the central role of meaning in language, it is essential that we understand what it is and where it comes from. One could easily spend an entire lifetime studying philosophical debates on the nature of meaning. I’ve taken a wade in this pool myself and quickly discovered that if I stayed in, I would soon be in so deep that I wouldn’t be able to do anything else, so instead of trying to swim alone, I have relied on a variety of philosophers and texts.⁴ Some of the details and the philosophical implications of cognitive linguistics are hotly contested within the movement itself.⁵ However, the vast majority of research that can be conducted in the cognitive linguistic framework requires only the principles I will describe in this subsection; the debatable details are of almost no consequence for the kind of work most of us do. I will therefore restrict my remarks to the assumptions that most cognitive linguists agree on.

⁴For example, the concepts presented in Innis 1994, who is working entirely from the perspective of the philosophy of meaning, are remarkably familiar to cognitive linguists, and indicate a strong potential affinity between the two lines of inquiry (cf. Janda 1999b.)

⁵There are some ideas associated with cognitive linguistics that one does not have to swallow in order to work within this framework. For example, Lakoff (1987) asserts that because all human experience is mediated through perception, humans have no unmediated transcendent experience of absolute reality, and therefore there is no absolute reality. In other words, cognitive linguistics can be taken as a proof that God does not exist. I would argue that our lack of access to absolute reality does not disprove the existence of this reality. Lakoff and Johnson (1999) take this argument even further, and come close to asserting that there is no real world out there. Again, I (and many other cognitive linguists) think that just because there are filters of perception and conception between us and the real world does not mean that the latter is absent, but I lack the philosophical sophistication (as well as the time and inclination) to attempt a refutation. Both Lakoff (1996) and Johnson (1992) have likewise used the premises of cognitive linguistics to support a certain moral perspective, but when Lakoff first presented his case at the 1995 ICLA meeting, there was strong opposition voiced by the audience, and Johnson’s article sparked considerable debate, chronicled in rebuttals published by McLure (1993), Gorayska (1993) and Sinha (1993). The point is that none of these theological or moral assertions necessarily follow from the premises of cognitive linguistics, and it is not necessary to agree with them in order to be a productive contributor to this field.

Meaning has to come from somewhere. It can't just exist by fiat as a set of symbols. It isn't just there in the words (or morphemes or whatever).⁶ And for the most part, meaning in natural languages cannot be manipulated by pushing symbols through the rigors of a set of logical rules. Very little of language can be fruitfully explained in this way. One cannot magically breathe the life of meaning into theoretical algorithms. The philosopher Hilary Putnam (1981) has gone to great pains to show that "brains in a vat" (i.e., a disembodied thinking system), though they might be able to pass symbols around, would not have access to meaning, and also that the assumption that meaning could exist in such a system leads to an essential logical error (cf. Lakoff 1987: 229-259). Cognitive linguistics works from the premise that meaning is embodied. This means that meaning is grounded in the shared human experience of bodily existence. Human bodies give us an experiential basis for understanding a wealth of concepts (often called "image schemas" in cognitive linguistics), such as IN vs. OUT, UP vs. DOWN, NEAR vs. FAR, COUNT vs. MASS, FIGURE vs. GROUND, BALANCE, and SOURCE-PATH-GOAL. One of the first experiences babies rehearse is that of the body as a container (IN/OUT), by putting things in their mouths. UP/DOWN is dictated by gravity and the erect adult posture, itself an achievement of BALANCE. NEAR/FAR, COUNT/MASS, and FIGURE/GROUND all derive from the way our senses work (primarily sight and hearing, though to a lesser extent touch, taste, and smell all participate in these distinctions), and SOURCE-PATH-GOAL results from our experience of ourselves and other objects moving through space. This is only a small sampling of the meanings directly attributable to bodily existence.⁷ Cognitive linguistics is an exploration of the fabric of meaning, woven thread by thread from bodily experience and embroidered by metaphor and metonymy. This is an ambitious and intricate project that still has a long future ahead of it.

It is necessary to remember that all experience is filtered by perception, and that as a consequence language is not a description of the real world (nor any possible world), but rather a description of human perception of reality. Therefore, when we examine meaning, our goal is not to find a correspondence between utterances and a world (real or otherwise), but rather to explore the ways in which meaning is motivated by human perceptual and conceptual capacities.⁸ A salient characteristic of these capacities is that they aren't constantly processing everything that comes their way; human beings are usually ignoring the vast majority of perceptual information available at any given instant. This ability to attend to certain inputs while ignoring the rest is essential to successful cognitive functioning, and can be manipulated at various levels of consciousness.⁹ The tension between what is perceptually and cognitively foregrounded and what is backgrounded can be resolved in a variety of ways, and can even be resolved differently by the same person at different moments. In cognitive linguistics we call this phenomenon *construal*, and it has significant linguistic consequences. For example, the same event of objective reality may be differently construed by different

⁶Cf. Reddy's (1979) article about how this common fallacy has been conventionalized in the metaphorical system of English and why it is indeed a fallacy.

⁷Johnson (1987) presents these and several other basic image schemas, and also discusses ways in which they are metaphorically extended to other domains in cognition, language, and art. Johnson's list of image schemas is very abbreviated; a complete catalogue would be enormous.

⁸The interplay of perception and conception has inspired Talmy (1996) to coin "ception" as an umbrella term.

⁹Churchland (1996) provides numerous examples of how human attention is focused and manipulated. At the neuronal level, it appears that vision, for example, tends to focus on moving objects. At the level of conscious manipulation, there are ambiguous drawings (the beauty/hag and rabbit/duck are the most familiar examples) that people can construe in different ways. This type of *construal* is probably more common and more significant in the manipulation of linguistic categories than it is in perception.

speakers or even by the same speaker in different utterances, thus resulting in differences in linguistic expression such as aspect, syntax, case, etc. Recognition of this fact is another reason why cognitive linguists do not aspire to prediction, yet construal enables us to examine a much broader spectrum of language use than would be possible if we assumed a direct correspondence between the input of exterior reality and linguistic output. Accepting the fact that there are both a body and a mind between those two endpoints makes the formula more complicated, but it also makes our endeavor more accurate (and note that formalism and prediction do not necessarily correlate with this type of accuracy).

Here's an anecdote to illustrate why the embodiment of meaning is important to linguists. A psycholinguist once called to tell me about some strange patterns he was finding in data on the grammatical status of numerals in various languages (I think he called me because Slavic languages provide rich evidence of this phenomenon). The numerals 'one' and 'two' tended to be treated differently, 'two' was sometimes treated differently from 'three', but sometimes they were treated the same, and often 'four' followed a similar pattern. However, 'five' tended to behave very differently from both 'four' and 'six', and 'six', 'seven', 'eight', 'nine', etc. tended to behave similarly again, usually aligned with 'five'. My colleague was puzzled by the fact that this distribution is so consistent among unrelated languages. My answer went something like this: you've found that 'five', 'one', and a lesser extent 'two' tend to have a special status in languages. To understand 'five', hold your hand up in front of your face. To understand 'two', notice your other hand, and the similar pairing of legs, eyes, ears, etc. 'One' is your experience as a unique human being, and your experience of single as opposed to plural things. The motives are all there in the body, though different languages may conventionalize and grammaticalize these facts in various ways.

The premise that meaning results from human bodily experience as processed by perception and cognition has many ramifications that cannot be explored in detail in this article. For example, there is a huge gulf between human and artificial intelligence. Why is that gulf there and is it bridgeable? The Turing ([1950]1996) Test was conceived as an operational definition of the goal of artificial intelligence – the creation of a computer that could think. The Turing Test involves a computer and a person engaged in conversation overheard by a human judge to whom the identities of the interlocutors are not revealed. According to Turing, if the human judge is unable to tell which interlocutor was the computer and which the live person, then the computer has passed the Turing Test, and the computer is indeed thinking, not just performing calculations. Searle ([1990]1996) protested that simulations such as the Turing Test are not adequate proof of conscious cognition, and presented an analogy to the Turing Test, the Chinese Room, in an attempt to defeat Turing's proposal. The Chinese Room contains a person who does not know anything about Chinese and a rule book that the person uses to match incomprehensible Chinese inputs with equally incomprehensible Chinese outputs. A Chinese speaker who provides the inputs and reads the outputs is satisfied that s/he is having a conversation with a Chinese speaker, but does this mean that the Chinese Room understands Chinese? Searle insisted that the Chinese Room does not understand Chinese, but rather than laying the Turing Test to rest, Searle's analogy sparked further debate over what it means to understand language, and some scholars insisted that his Chinese Room does indeed understand Chinese. Cognitive linguistics sided with Searle: his Chinese Room does not understand Chinese, and passing the Turing Test does not prove that a computer can think. It was thus assumed that the gulf between human and artificial intelligence is unbridgeable.

How might computers access meaning? Computers don't have bodies. Worse yet, they don't share our perceptual organs or our cognitive abilities (especially the drive to manipulate construal and to organize information in radial categories based on experience). Consequently, computers don't have access to meaning, the engine that drives both thought and language. Unless we can find a way to give them this access, computers will never be able to think or truly use language (rather than just aping cognitive and linguistic tricks via massive calculations). Barring such a breakthrough, machine translation of human utterances is similarly doomed to failure. But what if the problem is approached not by means of brute-force computation, but by means of providing computers with an embodied experience and a human-like way to process it? Churchland and Churchland ([1990]1996) presented a counterpoint to Searle, suggesting that advancements in artificial intelligence and neurobiology make it possible to envision a thinking computer. More recently, Steels (2010) and his collaborators have set up systems of robotic "agents" that have bodies and perceptual "organs", and play "language games" in which they negotiate linguistic categories for concepts such as color and location. Unlike the computers of Turing's and Searle's era, these robots do not function according to pre-set rule-based programs, but rather build categories of meaning based on their embodied experiences and communications among themselves. Their categories are dynamic and compatible with radial categories of human cognition. These robotic communities are beginning to use metaphor to understand time in terms of space, and their syntax is inspired by construction grammar. In other words, once the problem of artificial intelligence was re-stated in a way that took seriously the role of embodiment in meaning and the structure of meaning in human consciousness, progress became possible again.

4.5. The Structure of Cognitive Categories

If linguistic categories are cognitive categories, then we should expect them to have the same structure. Empirical research in psychology, neurobiology, and linguistics indicates that human knowledge is stored, accessed, and manipulated in categories with a specific structure. Set theory and Venn diagrams have trained us to expect that a category is defined by a boundary, that category membership is all-or-nothing (usually based on the criteria of necessary and sufficient features), and that all members of a category share equal status within the category.¹⁰ None of these parameters are valid for the vast majority of human categories. Rather than having a defining boundary and no internal structure, human categories tend to have a defining internal structure and no boundary. A given category is motivated by and organized around a prototypical member, to which all other members ultimately bear some relationship. Bearing a relationship to the prototype does not necessarily entail sharing a feature with the prototype, since a relationship to the prototype may be mediated by a chain of linked members, in which each contiguous pair shares features, but there may be no feature shared by category members at the extreme ends of this chain. Indeed, it is often impossible to arrive at the set of members of a cognitive category by using

¹⁰The notion of "fuzzy sets" attenuates the absolute values of these characteristics, but does not change the nature of the set structure. One should note that set theory is itself a metaphorical projection of the IN/OUT image schema. This fact makes the theory accessible and compelling, and very useful for many mathematical applications, but it is inadequate to the task of describing human categorization.

features to define it.¹¹ Complex categories can have numerous chains radiating from the prototype, and are therefore referred to as “radial categories”. The prototype has privileged status in a category, the densest structure of relationships to other members, and peripheral members are less representative of a category than the prototype (cf. Lewandowska-Tomaszczyk 2007). The relationship of the center/prototype to the periphery cannot be described in terms of a core + rules model, because the entire category, complete with its structure, is something that exists rather than being continuously generated from the center. The contents and structure of radial categories vary from language to language, and to some extent even from speaker to speaker. Radial categories are conventional and often language-specific, not a predictable result of the application of rules, and categories can both grow and shrink. The prototype is often also of higher frequency than other members of a category, however frequency is not a cause, but rather a symptom of prototypicality, and not an entirely reliable one at that.

An illustration will demonstrate some of these points. The English word *mother*¹² has as its prototype a woman who is married to the father of a child whom she conceives, gives birth to, and nurtures. However, of course there are lots of mothers: stepmothers, adoptive mothers, birth mothers, surrogate mothers, foster mothers, genetic mothers (egg donors), etc. None of the features of the prototype is necessary or sufficient to define all these people as mothers, since there is no one feature that they all share (a birth mother usually does only the conceiving, gestating and birth, but none of the nurturing, whereas the opposite is true of an adoptive mother; a stepmother is not required to perform biological or nurturing functions -- she need only be married to the father). And the category of mother is a dynamic one, showing growth at the periphery in response to fertility technologies and new legal and ethical precedents. The category represented by English *chair* demonstrates that such categories are often language-specific. Both Czech and Russian use an entirely different lexeme for what we call armchair (Cz *křeslo*, R *kreslo*) than for what we call chair (Cz *židle*, R *stul*); for Czechs and Russians, an armchair is not in the chair category, it's a different object altogether. Furthermore, Czechs are capable of viewing a wheelchair as either a type of armchair or as an entirely different type of object. In the literary language, a wheelchair is *křeslo na kolečkách*, literally an ‘armchair on wheels’; but in the spoken language a wheelchair is usually called *vozejk*, a ‘small cart’. Thus even in different registers of a single language the conventional categorization of an object can vary. The value of the radial category to linguistics is by no means limited to the semantics of lexemes such as *mother*. Successful analyses demonstrating the validity of this model have been applied to many phenomena, among them the allo-/eme relationship (phonemes and morphemes are central to categories with allophones and allomorphs being relatively more or less central or peripheral), the semantics of grammatical morphemes (such as conjunctions, prepositions, prefixes,

¹¹I have been searching for a counterexample to this for years, by asking students (and offering them credit toward their grades) to find a definition via features that will accurately capture all and only the members of a category represented by a monomorphemic lexeme of their choice, yet no one has ever succeeded in this challenge. Every featural description either excludes members that need to be included, or includes members that should be excluded, and most descriptions do both. Thus “four legs, a seat, and a back” as a definition of “chair” excludes wheelchairs and beanbag chairs, but includes many stools, couches, and benches, whereas “made to be sat upon” excludes toy chairs and logs that might be referred to as chairs when they come in handy at a campsite, but again includes other pieces of furniture for sitting. Even if a counterexample is found, it is clear that the vast majority of human categories (linguistically represented as morphemes) do not yield to a featural analysis.

¹²This example of mother is borrowed and adapted from Lakoff 1987.

suffixes, and desinences), and the syntax of grammatical constructions (where some constructions are prototypical, and others are variants of these prototypes). Indeed, the radial category provides powerful explanations for all kinds of linguistic relationships involving polysemy, for it allows the linguist to explore both the variety and the coherence of related items (rather than attending exclusively to either the variety by making atomistic lists, or to the coherence by assigning abstract features that fail to capture the variety). The linguist can see both the trees and the forest, since even the messiest array of related items can usually be viewed as a unified (though internally complex) category. As I have argued elsewhere (Janda 1996b), the radial category also establishes the asymmetric relationships (between center and periphery) that motivate the phenomena that linguists of all stripes attribute to markedness. Markedness thus emerges as a by-product of the way in which human knowledge is organized. I have likewise argued at length (Janda 1993a, 1993c, 1996a, 1998) that linguistic change flows according to the structure of radial categories (with pruning and growth expected at the periphery; analogical leveling is therefore the pruning of a peripheral category member in favor of the prototype). The prototype of any category is an item with special salience. This special salience is not something that can be mathematically defined (e.g., as the one feature shared by most members of the category). Instead this special salience is attributable to how human beings interact with members of the category, which is exactly what we should expect given that meaning is grounded in human bodily experience. The source of meaning for the word *chair* is a kinesthetic image schema of how a human being typically interacts with a chair. In other words, the act of sitting in a prototypical chair is the experience that defines what a chair is, and variations on that experience result in variations among the peripheral members of the category. Human interaction generally proves to be much more significant than features that might be available in an “objective” description of a category. For example, even though dictionaries and English speakers consistently identify falsity of information as the defining feature of *lie*, when presented with potential examples of lies (some containing true and some containing false information), speakers of English consistently rate incidents involving intention to deceive (even when all the information is true) as better examples of lies than incidents merely containing false information.¹³ In other words, it is the human interaction with lies, the experience of being deceived, that is most salient in the prototype for this category. One might easily claim that the objective defining feature of the *bird* category is the presence of feathers. However, feathers are only a minor factor in human interaction with birds, which also includes experiences such as that birds move fast (preferably by flying), are voracious eaters, sing, build nests and lay eggs in them, and both birds and their eggs are often a source of food. The current popularity among non-scientists as well as many paleontologists of the theory that birds and dinosaurs are the same kind of creature has been facilitated by discoveries that some dinosaurs did move fast, eat a lot, and lay eggs in nests. Knowing that some dinosaurs exhibited behavior like the salient prototypical behavior of birds makes it easy to imagine these dinosaurs as “featherless birds”, a concept that would be oxymoronic under a featural analysis requiring feathers in order to belong to the bird category. It is the way we interact with birds that makes it possible for us to imagine the existence of dinosaurs that were really birds rather than reptiles (which do lay

¹³This result was published in Coleman and Kay 1981, and I have reduplicated it with students in class demonstrations over the course of nearly two decades. Though all of the samples involved are small, the consistency of results is compelling.

eggs, but nobody seems to want to call them birds, probably because they don't usually move very fast or eat very much, nor do they build impressive nests, etc.). The urge to categorize is very strong, and it seems that in order to process, store, manipulate, and access information, human beings need to organize it in categories. Even damaged, partial, and irrelevant information is run through this process, enabling people to make sense out of fuzzy or faded photographs, or to "see" various items in the shapes of clouds and inkblots. As neurobiologists have indicated, there is no "grandmother cell" in the brain that uniquely contains everything you know about your grandmother, nor is any other information stored as discrete bits. Instead all information is distributed and interconnected. Not only is information arranged in categories, but these categories are related to one another, and further participate in a hierarchy of categorization involving subordinate and superordinate levels. All of the categories we have looked at in this section have been basic-level categories, which generally correspond with monomorphemic linguistic units (like *bird*, *chair*, *mother*, or a grammatical morpheme). The subordinate level provides finer detail clustered around members of a given basic-level category (thus the category of *armchairs*, with ones that recline or swivel and ones that do not, etc., would be a subordinate category). The superordinate category of *furniture* includes the chair as one of its more prototypical members (with items such as chaise-longues, ping-pong tables, standing lamps, and cabinet-style television sets as relatively more peripheral examples of furniture). Subordinate, basic, and superordinate levels are not simply concentric sets; these relationships are complex and follow the center/periphery structure. Radial categories of all types (organizing lexical meaning, grammatical meaning, and hybrid types) are constitutive of mental spaces that structure both thought and language use. Furthermore, Lamb (1999) has shown parallels between the structure of the brain and the structure of radial categories, suggesting that radial categories are indeed neurologically plausible. A radial category is not necessarily composed of unique, discrete members, each occupying a single slot in a structure defined by a single set of relations to the prototype. Cognitive categories are not in the business of pigeon-holing information anymore than the brain is in the business of growing "grandmother cells". Often there are category members that fit into a given category in more than one place (or in a transitional zone between parts of a category) and/or are related to the prototype in more than one way. Cognitive linguists refer to such category members as "multiply motivated", and do not eschew such redundancy, since it is a natural part of human cognition. The recognition of multiply motivated category members allows us to analyze and account for phenomena of ambiguity and overlap, which are rampant in natural languages, but frequently ignored by linguistic theories. Langacker (2006) reminds us that overall linguists tend to be more attracted by models that emphasize discreteness instead of models that emphasize continuousness of phenomena. The radial category, for example, lends itself to an overly discrete interpretation that suppresses the real continuousness of category structure. Langacker suggests instead a model that looks like a mountain range, where the peaks (that are equivalent to the subcategories or members of a radial category) are joined by continuous zones that connect them in multiple ways. In addition to the prototype, many cognitive linguists (especially Langacker and his students) posit an overall abstract schema that sums up an entire category and relates to all the members. This concept is probably more important and more understudied than most of us realize. Cognitive linguistics still has quite a bit of work to do in order to research, develop and ultimately define the role of the overall abstract schema (perhaps best described as "firstness" for those familiar with Peircean semiotics). While the examples presented in this

section have focused on lexical items such as mother and chair in English, radial semantic structures are also found among linguistic categories and thus form the backbone of grammar. I have for example examined Russian cases as radial categories (Janda 1993c, 1999b, 2000). The Russian genitive case is a basic level radial category with a prototypical member (SOURCE) and three extensions (GOAL, WHOLE, REFERENCE) motivated by metaphor and metonymy. Subordinate structures organize smaller details of meaning (such as the metaphorical implementation of the SOURCE meaning in the various domains of space, time, etc.), and the basic level category of the genitive participates in a superordinate category of case relationships in general.¹⁴ There is evidence that this kind of organization motivates most (perhaps all) linguistic phenomena.

4.6. Mental Spaces and Mapping

Cognition and the use of language involve the access and manipulation of mental spaces. Mental spaces are constructed from human perceptual experience and are extended through imaginative mapping processes. The three most significant processes are metaphor, metonymy, and blends. All three processes are vital to linguistic analysis. Although much of the scholarly work that has been done on metaphor, metonymy, and blends focuses on the meanings of lexical items, these cognitive processes are likewise vital to the structure of grammatical meaning. Of course this is exactly what we should expect, given that grammar and lexicon form a single continuum, governed by the same general cognitive strategies. Metaphor, metonymy, and blends appear to have neurological analogs. It is believed that eye-hand coordination is achieved by mapping vectors of eye angles onto vectors of muscle contractions, in other words, taking information from one domain (eye positions) and transferring this information to find “equivalents” in another domain (muscle positions) (Churchland 1986), a process that looks very much like metaphor. Feldman (2006) asserts that metaphor is consistent with the architecture of the brain. A computer simulation of human retinal cells (Churchland 1995: 236-242) reveals that our visual perception focuses on certain information (particularly movement and edges), largely ignoring other possible inputs. Thus we tend to see moving parts and edges rather than wholes, and this seems to parallel metonymy. These analogs do not mean that we know how metaphor and metonymy work on the biological level, but they do mean that metaphor and metonymy at least appear to be biologically plausible (whereas serial processing of ordered rules seems much less promising, given what we know about brain structure and neural processing time).

4.6.1. Metaphor

For a cognitive linguist, the definition of metaphor is very broad. A metaphor is a mapping from a source domain to a target domain. In other words, whenever a person takes a

¹⁴The most prototypical member of the superordinate category is the nominative case (which is why we think of it as the “default” case in dictionaries, on signs, etc.). Accusative is somewhat more peripheral (opposing the nominative as an agent to the accusative as a patient in a prototypical SVO clause). The genitive is even more peripheral, since it does not involve the verb (central to the structure of a clause). And the instrumental, dative, and locative are relatively peripheral in relation to the nominative, accusative, and genitive, respectively. In other words, Jakobson ([1936]1971) was right, and indeed much of his work on case (and other phenomena) looks to a cognitive linguist like it was ahead of its time.

concept that has been formed in one domain and tries to implement it in another, a metaphor has occurred.¹⁵

The domain in which most human knowledge is formed is that of a human body in physical space, which usually serves as the source domain for metaphor. Common target domains are time, emotions, and states of being. As mentioned above, babies become acquainted with their bodies as containers by practicing putting things in their mouths. After this routine has been established, they move on to placing objects in other containers, and many baby toys are designed just for this task. On a crude level, even this is a metaphor, for the concept IN/OUT has thus been mapped from the body to external objects. Later, babies will learn to extend IN/OUT to many other domains; in English these include time (*getting things done in time* and *running out of time*), emotions (*falling in* and *out of love*), and states of being (*getting into* and *out of trouble*). The ways in which metaphorical extensions are realized and conventionalized are highly language-specific, but the metaphorical process itself is a pervasive universal. Metaphor is a very robust phenomenon for all languages. It is quite impossible to speak any language without mastering the metaphorical conventions embedded in it.

Lakoff and Johnson (1980) identify three basic types of metaphor: orientational metaphor, ontological metaphor, and structural metaphor. Orientational metaphor is the extension of orientations such as IN/OUT, UP/DOWN, FRONT/BACK to non-spatial domains. Ontological metaphor is the conceptualization of non-things (emotions, abstract ideas, ambient phenomena) as if they were things (usually entities, substances, or places), as in *We are working toward peace* (where peace is conceived of as an object or place), or *His emotional health has deteriorated recently* (where emotional health is an object subject to deterioration). Structural metaphors take an item with rich structure in bodily experience as the source domain for understanding something else. For example, the structural metaphor PEOPLE ARE PLANTS underlies many metaphorical expressions, enabling us to refer to the growth of children as *sprouting up*, youth as a *blossom*, old age as a time of *withering and fading*, and the slaughter of soldiers as being *mowed down*. The three types of metaphor are not entirely discrete and often collaborate in a given expression. *Falling in love*, for example, uses all three types: an orientational metaphor extending the use of *in*, an ontological metaphor identifying *love* as a place, and a structural metaphor that maps our understanding of physical falling onto our understanding of an initial encounter with love. Languages make use of all three types of metaphor in their grammars. Orientational metaphors are quite routine (often involving cases, prepositions, and prefixes), and they typically collaborate with ontological metaphors (as in *getting things done in time*, *running out of time*, where time is a container or a substance). Grammatical case uses a structural metaphor mapping our

¹⁵Notice that under this definition there is no substantive difference between metaphor and simile, or, to be more accurate, all similes are actually metaphors. US public education never fails to indoctrinate all children with the belief that there is an important difference between the two, and disabusing them of this notion at the college level can be quite a challenge. The difference they have learned to cherish is one of superficial syntactic variations on metaphorical expression that has little bearing on the substance of the comparison. It also hides the fact that there are more ways to produce metaphor than by saying that “x is y” or even that “x is like y”. Metaphor is present in all kinds of syntactic situations, and can be expressed by all kinds of morphemes. Here are two examples with an adjective (firey) and a verb (beefing): firey anger; authorities are beefing up security at area schools (see also the metaphors using IN and OUT and those that motivate Russian aspect described in this section)

experience of physical relationships to understand the abstract relationships among referents in a sentence.

Though it appears that all languages of the world make use of TIME IS SPACE metaphors (Haspelmath 1997b), it seems that every language does this in its own way. One example that I am very familiar with is the aspectual system of Russian. All Russian verbs identify the situations they describe as either perfective or imperfective. This grammatical distinction is motivated by a pair of metaphors: PERFECTIVE IS A DISCRETE SOLID OBJECT and IMPERFECTIVE IS A FLUID SUBSTANCE (Janda 2004). The rich source domain of physical matter yields over a dozen parameters according to which verbal situations can be differentiated, such that perfective situations are characterized by clear boundaries, uniqueness and countability, whereas imperfective situations are characterized by lack of clear boundaries, spreadability, and mixability. The metaphorical understanding of verbal situations as isomorphic to types of matter makes it possible for Russian grammar to organize a large complex of distinctions in a coherent way.

The mapping that metaphor performs is usually highly selective. It is by no means a one-to-one mapping of all the information from a source domain to a target domain. For example, the fact that in English we use fire as a source domain for understanding anger (cf. Lakoff 1987: 380-415; *His temper is like a powder-keg, She's white-hot with rage, I'm fuming, doing a slow burn*, etc.) does not mean we expect anger to be something we can light with a match, use for cooking, or that we will have to clean up ashes afterward. Like the prototype, metaphor is motivated by relevant information that is salient in human experience; it highlights some facts about the target domain, but hides others. The behavior of metaphor is likewise well-motivated but not entirely predictable.

For the purposes of grammatical analysis, metaphor is equally essential. Metaphors involving IN/OUT, as mentioned above, and similar metaphors based on kinesthetic image schemas are valuable for exploring the meaning and grammatical functions of cases, prepositions, and all sorts of linguistic categories and functor words. Iconicity is properly understood as a metaphorical phenomenon, for it is the mapping of a parameter from one domain to another. Analogy in both the broad ordinary sense and in the specific linguistic sense of analogical change is likewise the product of a metaphorical transfer of information from one place (usually a paradigm) to another.

When linguists recognize and focus on the central role that metaphor plays in language, it becomes possible for us not only to better understand grammatical phenomena, but also to participate in cultural studies and poetic analysis (cf. Janda 2008, Lakoff and Turner 1989, Palmer 1996, Turner 1987). The difference between the types of metaphors prevalent in linguistic categories and those encountered in creative expression is not a matter of quality, but rather a matter of the degree to which certain metaphors have become conventionalized in a given language and culture. Conventionalized metaphors form the backbone of linguistic categories, idioms, clichés, expository prose, and ritual. Creative use of writing contains metaphors that are either less conventional (being extensions of conventional metaphors, cf. the jokes mentioned in footnote 1), or altogether unconventional.

It is instructive to note that most scientific theories are based on metaphors, and that the inferences we draw from theories are influenced by our understanding of these metaphors. Set theory is the IN/OUT image schema writ large. The modern understanding of the chemical structure of benzene arose from an iconic metaphor inspired by a dream of a snake biting its tail. Understanding of atomic structure underwent many metaphorical realizations in the 20th

century, going from a grapes in gelatin model, to a model of a miniature solar system, to a mathematical probability model. Light continues to be understood partly according to a metaphor based on waves and partly according to a metaphor based on particles. Closer to home, the vowel triangle is a metaphor that helps us predict which vowels are likely to turn into which other vowels because they are “closest” to each other. Radial categories are likewise a metaphor of our experience of points and links (rather like the old tinkers toys).

The presence of metaphors in scientific theories is not a problem unless we forget that they are metaphors and assume that we are just dealing with raw “truth”. Metaphors facilitate understanding and lend power to our theories, and they often inspire us to draw inferences that we might otherwise overlook. However, they can also inspire us to draw incorrect inferences or can shade our eyes from inferences that we should consider (were we not so enamored of the current metaphor). We need to be able to not only recognize and respect metaphors, but also to look beyond them (Langacker 2006).

4.6.2. Metonymy

Metonymy is present whenever one item, the “vehicle” stands in for another item, the “target”. Metonymies can thus be modeled as VEHICLE FOR TARGET formulas. If I say *Dostoevsky takes up a whole shelf in my library* I am using an AGENT FOR PRODUCT metonymy, where the agent, Dostoevsky, stands in for his products, i.e., books he has authored. Similarly, an utterance like *The ham sandwich wants his check* is an example of POSSESSED FOR POSSESSOR metonymy, since the possessed ham sandwich stands in for the person who has (or had) it. Most work on metonymy has thus far focused on lexical metonymy (such as the examples above), and there are roughly three main strategies for classifying metonymy, involving contiguity, frames, and domains. Jakobson ([1956]1980) pioneered the understanding of metonymy as a kind of contiguity relationship, and this is echoed in Croft’s definition of metonymy as a mapping within a single “domain matrix”.

The most recent version of the contiguity model is found in Peirsman and Geeraerts 2006, where four levels of contiguity are distinguished (part/whole, containment, contact, and adjacency) along a scale of prototypicality. The use of frames to model metonymy has been particularly popular in cognitive linguistics (Kövecses and Radden 1998, Radden and Kövecses 1999, Panther and Thornburg 1999, Barcelona 2002). Under this model, it is the fact that items such as customers, meals ordered, waiters, and checks all belong to a single “restaurant frame” that motivates metonymies such as the one in the *ham sandwich* example above. The frame approach is very similar to that invoking domains (or “dominions” Croft 1993, 2006; Langacker 1993, 2009; Ruiz de Mendoza 2000).

All phenomena of ellipsis, truncation, and phonological reduction/neutralization are linguistic examples of metonymy. Very common uses of metonymy in the world’s languages are the reduction of movement along a path to either a stationary path or just the endpoint of a path. English over provides examples of both types of reduction. We can invoke movement along a path by saying *Bill walked over the hill*. This can be reduced to a stationary path in *The road goes over the hill*. A statement like *Bill lives over the hill* accesses only the endpoint of the path described by *over*. Similar use of endpoint metonymy is common in the semantics of grammatical case.

In my work on the dative case in Slavic, I have argued that metonymy has been used to extend the indirect object to constructions lacking a direct object (Janda 1993a). There are many verbs (especially verbs that denote the giving of money/gifts, giving of messages, and

giving of good/evil, such as the Slavic equivalents of ‘pay’, ‘advise’, and ‘please’/‘hamper’) that denote the giving of something that is so predictable from the meaning of the verb itself that there is no need to express the something given as an accusative direct object. We know, via metonymy, that when we pay someone, we are giving them money; when we communicate with someone, we are giving them a message; and when we please or hinder someone, we are giving them a good or hard time. This metonymy motivates the use of the indirect object, and therefore the dative case, with a host of verbs which otherwise look rather like a random list. A huge system of semantic associations is present in the word-formation systems of most languages of the world, and these associations are primarily motivated by metonymy (Janda forthcoming). Thus, for example, in English we can form *cellist* from *cello* via an INSTRUMENT FOR AGENT metonymy, and *baker* from *bake* via an ACTION FOR AGENT metonymy. Word-formation is thus another example of how metonymy pervades the grammar of languages, and indeed as Langacker (2009) asserts, grammar is metonymic by its very nature. It is certainly the case that metaphor and metonymy can interact in a single linguistic expression (Goosens 1990, Geeraerts 2002). When Johnny Cash sings *Many days you have lingered all around my cabin door, Oh hard times, come again no more*, he is invoking both metaphor and metonymy simultaneously. Metaphorically, hard times are represented as a person who can be located by the door and directly addressed. Metonymically the location of the door refers to the setting in which a person is living, so having the hard times at your door means that one is living in a period of hard times.

4.6.3. Blends

Like metaphor, a blend involves two domains and a mapping relationship (Fauconnier and Turner 2002). However, in a blend both domains are source domains, and together they contribute to the creation of a third, entirely new domain. For example, if I were to talk about a discourse between Roman Jakobson and cognitive linguistics, I might say that Jakobson made certain contributions (such as the “relative invariant”), which cognitive linguistics reacted to (suggesting prototypes instead), and that Jakobson did not accept all the premises of cognitive linguistics, etc. This discourse is of course hypothetical and anachronistic, since Jakobson died in 1982, several years before anyone ever used the term “cognitive linguistics”. The discourse is a blend constructed from Jakobson’s work and work on cognitive linguistics. On the morphological level blends are fairly common and are traditionally called just that: blends. Morphological blends include the coinage of words like *motel* (from *motor* + *hotel*) or *workaholic* (from *work* + *alcoholic*). Blends also occur at the level of the linguistic category. The historical development of virile endings from what was originally dual morphology in some Slavic languages appears to be the result of a blend in which special distinctions that could be made in the plural number and special distinctions that could be made in the masculine gender contributed to the creation of a special plural masculine distinction, namely virility (Janda 1999a).

4.7. Construction Grammar

Construction grammar can be understood as an outgrowth of Langacker’s (1987: 58) definition of grammar as “symbolic units” which pair form (phonological pole) with meaning (semantic pole). A construction is any conventionalized pairing of form and meaning in

language, at any level, from the level of the morpheme, through words and phrases, and up to the level of discourse. Although construction grammar comes in several “flavors” -- cf. the slightly different versions offered by Langacker (1987, 1991a-b, 2003), Croft (2001), Goldberg (1995 and 2006), and Fillmore (Fillmore 1985, Kay and Fillmore 1999) -- they all share a similar view on the relationship between the parts and the whole in a construction.

A construction cannot be adequately described by means of recourse to compositionality because the meaning of the whole is only partially determined by the meanings of the components. And conversely, the meaning of the parts is clearly influenced by the meaning of the whole. The failure of compositionality is clearest in the case of idioms like *he kicked the bucket*, where the whole has a meaning that cannot be arrived at from the parts. Construction grammarians will quickly point out that idioms are only the extreme end of the scale, and that all constructions are idiomatic to some extent. Even the conventionalization of SVO as a typical transitive construction can be considered schematically “idiomatic”. The converse effect of the whole influencing the meaning of the parts is most visible in examples of “coercion” such as *Alice sneezed the napkin off the table* and *There is dog all over the road*. In the first example, the caused-motion construction (verb + object + direction) coerces a strongly intransitive verb, *sneeze*, to behave like a transitive verb. In the second example, the use of a singular verb form in a context describing a substance coerces a count noun, *dog*, to behave like a mass noun. Again, scholars who work in construction grammar assert that this is only the tip of the iceberg, and that all constructions show this effect to various extents. In some collaborative work (Janda and Solovyev 2009), I have explored how case constructions used with Russian emotion terms reflect the conceptualization of emotions as containers, gestures, diseases, and sources. In other words, the use of emotion terms in the same constructions where we find containers (e.g., with prepositions meaning ‘in’, ‘into’), as in *v pečali* ‘in sadness’ reveals that sadness can behave like a container in Russian. The meaning of each construction is emergent (Langacker 1991b: 5-6, 534), motivated by the patterns of uses over the various items that appear in the construction, and also by the larger (clause- or discourse-level) constructions that a given construction appears in.

Goldberg (2006: 62, 46) claims that it is unlikely that speakers store all uses of given words and constructions, but there is evidence that people use generalizations about the frequency of word use (cf. also Dąbrowska 2004 for evidence of both storage and generalization in acquisition of constructions). These generalizations can serve as the basis for creating abstract schemas for constructions, establishing correlations between form and meaning. Goldberg (2006: 104-119) argues that constructions have strong associations with meaning by virtue of their advantages in terms of both cue validity and category validity. Cue validity refers to the likelihood that a given meaning will be present given the presence of a certain item.

In a study comparing the cue validity of words (verbs) with constructions, Goldberg found that words and constructions have roughly equal cue validity, which means that knowing that a linguistic unit contains a given word gives you about the same predictive information as knowing that a linguistic unit occurs in a given construction.

However, because there are far fewer constructions than lexical items in a language, constructions are far more available in terms of determining meaning. Category validity is the likelihood that a certain item will be present when the meaning is already given.

In Goldberg’s studies the category validity of constructions is found to be far higher than that of words (verbs). In other words, if you know that a unit expresses a certain meaning, it is

much easier to predict what construction might be present than to predict what word the unit might contain. Goldberg has thus empirically established the connections between constructions, frequency and meaning.

Construction grammar has become an important sub-field of cognitive linguistics, with significant publications (Östman and Fried 2005), and international organization, and a conference series. The presence of frequency effects in relation to constructions has fueled much of the application of quantitative methods in cognitive linguistics, described in more detail in 5.1.

5. ADVANTAGES OF COGNITIVE LINGUISTICS

Cognitive linguistics offers a number of advantages over some other linguistic frameworks, particularly in relation to the range of language phenomena it can address and in relation to researchers' need to communicate their results. I would contend that cognitive linguistics facilitates the analysis of far more language data, and that the results of analysis are far more accessible to others both within and particularly beyond the field of linguistics.

5.1. Cognitive Linguistics Is Data-Friendly

From the very beginning, cognitive linguistics has been a refuge for linguists who are intimately acquainted with real language data and have a profound respect for empirical methods. The most outstanding contributions made by cognitive linguists continue to be insightful analyses of intricate sets of naturally-occurring data performed by linguists with a subtle and detailed understanding of the languages they work on. Although theory is a crucial concern, it is treated as something that emerges gradually from and must be constantly verified against data. It is impossible for a proper cognitive linguist to imagine "marshalling data to support theory" (an exact quote in which I heard one non-cognitive linguist praise another for his unswerving devotion to theory). Whenever I hear an expression of this sort, I shudder to think what this means: Was the data forced into conform to pre-determined regiments? What happened to the "naughty" data that didn't support the theory? Was it banished from consideration? Where did the data come from? Was it real data (spontaneously produced by native speakers under natural conditions)? Or not (concocted, elicited, etc.)? I rejoice in finding the "naughty" data that challenges us to stretch or change our theory. This "naughty" data need not be the least bit exotic or ungrammatical – it's usually hidden in plain sight, until you gather a database of real usage or peer into a corpus. I always start every project by gathering as much data as I can before worrying too much about how it might be organized, and I likewise insist that all my students "get their hands dirty" with some data before settling on an analysis. There is much that can be learned about linguistics by simply gathering and sifting through data, and no amount of theory or classroom lecturing is a substitute for this experience.

The framework of cognitive linguistics (especially the radial category and metaphorical extensions of it) is particularly adept at handling analyses of very messy arrays of data. There is never any motive for hiding or ignoring "problematic" data, primarily because cognitive

linguistics is interested in finding internal structures, however fine-grained, rather than airtight immutable boundaries for categories. The “ugly ducklings” that are often shunned by other theories are properly appreciated for their beauty in this framework. For example, the Russian verb *zavidovat* ‘envy’ bears no close affinity to any other “dative-governing” verbs, but it serves as an important transitional type linking two parts of the semantic category of the dative case (Janda 1993c). Case usage is itself an example of a relatively messy phenomenon for which cognitive linguistics provides an ideal solution, making it possible to respect all the variation while producing a coherent analysis. This not only facilitates the description of a given case in a given language, but it also makes cross-linguistic comparisons relatively easy and transparent (a feat not previously achievable). Case semantics is only one of the enduring, intractable problems of Slavic linguistics for which the cognitive framework is likely to provide elegant solutions.

Cognitive linguistics is an excellent framework for probing both the complete range of language use (all natural production, including errors, anomalies, creative use, poetry, idioms, even “dead metaphors”) and the complete range of language phenomena (phonology, morphology, syntax, and semantics).

In the past decade, more and more cognitive linguists have taken the usage-based model of cognitive linguistics seriously by applying quantitative analyses to corpus and experimental data. This empirical movement has been facilitated by the advent of digital corpora and statistical software. Stefanowitsch and Gries (2003, 2005) have pioneered “collostructional analysis”, which takes a grammatical construction as the point of departure and investigates to what extent lexical items are attracted or repelled by constructions. Stefanowitsch (2006 a and b) has proposed statistical means for analyzing metaphorical expressions. Newman and Rice (2006) have examined the relationship between paradigm-form frequency and semantics of verbs. Divjak (2006; cf. also Divjak and Gries 2006) explores the “behavioral profiles” of Russian verbs, namely the way that grammatical, semantic, and constructional factors interact statistically. Schmid has probed the relationship between frequency and entrenchment, first asserting a direct relationship (2000), and then finding that model inadequate (2007a-b). These are just a few examples of where cognitive linguistics is headed in terms of quantitative analysis. In 2005 Mouton de Gruyter launched the journal *Corpus Linguistics and Linguistic Theory* as a venue for this promising line of research.

5.2. Cognitive Linguistics Is User-Friendly

The absence of an entrenched formalism has its advantages. A cognitive linguist never has to build a mountainous formal machine to strain at a gnat (or any bigger prey, for that matter), and no one has to master a formal system in order to appreciate research in cognitive linguistics. This means that cognitive linguistics research is readily accessible to all linguists, and also that cognitive linguists can focus more of their effort on collecting and analyzing data than on toying with the formal artifacts of a theory. With minor adaptations, research done in cognitive linguistics can be made accessible to other audiences. This is particularly valuable for those of us who wish to communicate with colleagues in other fields, or for researchers who submit grant proposals that will be evaluated both by linguists and by other scholars. More important is the fact that cognitive linguistics facilitates the transfer of

research to teaching; it allows us to make our research breakthroughs available to students. Rather than encouraging the production of arcane scholarship, too often consisting of minutiae hopelessly embedded in complex and counterintuitive frameworks, cognitive linguistics facilitates the production of scholarship that is actually useful, both to scholars and to students.

Case and aspect are universally acknowledged as the greatest stumbling-blocks for learners acquiring a Slavic language as a second language. I have coauthored two textbooks on the case systems of Slavic languages (Janda and Clancy 2002, 2006), plus a media module on the Russian aspect system (<http://hum.uit.no/lajanda/aspect/ainr/>). These materials take the full complexity of my research on case and aspect and make them accessible to language learners with no linguistic expertise. These learner-oriented materials contain virtually no terminology; the most difficult terms encountered are “verb”, “preposition”, and the like. Formalism is also nearly non-existent; the use of diagrams is the closest we come to formalism, yet is itself mainly decorative, since the contents of the diagrams are also rendered in everyday prose and the materials can be comprehended without recourse to the diagrams. In studying the meanings Russian cases, learners are asked to build upon their everyday experiences (of orientation, forces, and movement along a path, for example), and to use metaphor to extend spatial concepts to other domains such as time and states of being (guided by familiar and parallel metaphorical extensions in English). The strategy for learning Russian aspect is similar, asking learners to rely upon their “sandbox” knowledge of how various kinds of physical matter behave and interact. In the latter materials, interactive units lead the learner through virtual “experiments” with matter (asking which kinds of matter can be sliced or spread, for example), and provide comparisons with authentic examples of Russian aspect. Perhaps it is immodest of me to say so, but the reaction to these materials has been enthusiastic, proving that cognitive linguistics can be made utterly transparent and valuable for many people other than cognitive linguists. The 2002 book on Russian case won a nationwide award (for pedagogy, from the American Association of Teachers of Slavic and East European Languages). The 2006 book has found an audience that we never imagined: it is being used to teach deaf citizens in the Czech Republic to read Czech (since case is non-existent in Czech Sign Language, and thus just as exotic a phenomenon for those learners as for learners with a non-Slavic spoken language as their first language).

CONCLUSION

This article reflects my personal perspective on cognitive linguistics, which has now grown to the point where it is almost impossible for any one individual to have full oversight over the entire field. In closing, I would like to remind both myself and everyone else that all theoretical frameworks, cognitive linguistics included, are built upon metaphorical models, and all metaphorical models reveal some truths and suggest some questions while suppressing other truths and other questions that might be asked. In other words, neither cognitive linguistics nor any other framework is entirely comprehensive; no one framework is THE answer to all our problems. Some frameworks are more apt than others, particularly at addressing given issues. Cognitive linguistics happens to be a great way to deal with the kinds of puzzles that light my fire: grammatical meaning, polysemy, and historical change. But

ultimately the use of any one framework shutters one's eyes one from other opportunities for inquiry. If we cannot communicate across theories, we risk a fate like the proverbial three blind men encountering an elephant: one finds the ear and declares that an elephant is like a sheet of leather, one finds the side and declares an elephant to be like a wall, and the third finds the tail and declares an elephant to be like a rope. The results of their research are entirely incompatible and they are unable to find any common ground on which to base a discussion. Cognitive linguistics offers one view of linguistic inquiry. Thus far I've enjoyed that view and never run out of things to see from this vantage point, and I've also tried to make my contributions as accessible as possible to others who might want to join me. I've attempted to peer at language phenomena from other points of view now and again (more as a spectator than as a participant), but too often found unnecessary theoretical artifacts in my way. It is my sincere hope that more bridges to frameworks beyond cognitive linguistics will be built as we progress.

Chapter 70

CONCEPTUALIZATION, SYMBOLIZATION, AND GRAMMAR*

Ronald W. Langacker

University of California, San Diego, CA, US

ABSTRACT

Cognitive grammar belongs to the broader traditions of cognitive linguistics and functional linguistics. It emphasizes the symbolic function of language and the crucial role of conceptualization in social interaction. It is based on a conceptualist semantics recognizing the central importance of construal, i.e., our ability to conceive and portray the same situation in alternate ways.

A properly formulated conceptualist semantics makes possible a symbolic account of grammar. It is claimed that lexicon and grammar form a continuum fully describable as assemblies of symbolic structures (form-meaning pairings). Grammar is therefore meaningful, and valid grammatical notions have conceptual import. By way of example, a variety of evidence is cited to support semantic characterizations of subject and object.

Keywords: cognitive grammar, cognitive semantics, conceptualization, construction, grammatical category, object, profile, prominence, psychological evidence, subject, symbolization

INTRODUCTION

Language has two basic and closely related functions: a *semiological function*, allowing thoughts to be symbolized by means of sounds, gestures, or writing; as well as an interactive function, embracing communication, expressiveness, manipulation, and social communion. A pivotal issue in *linguistic theory* is whether the functions language serves should be taken as foundational or merely subsidiary to the problem of describing its form. The recognition of

*This article is adapted and updated from Langacker 1998.

their foundational status is the primary feature distinguishing functionalist approaches to language from the formalist tradition (notably generative grammar).

The movement called *cognitive linguistics* belongs to the functionalist tradition. Although its concern with cognition hardly makes it unique, the label cognitive is not entirely arbitrary. Within functionalism, *cognitive linguistics* stands out by emphasizing the semiological function of language and the crucial role of conceptualization in social interaction. It contrasts with formalist approaches by viewing language as an integral facet of *cognition* (not as a separate “module” or “mental faculty”). Insofar as possible, linguistic structure is analyzed in terms of more basic systems and abilities (e.g., perception, attention, categorization) from which it cannot be dissociated.

The theory called *cognitive grammar* (Langacker 1987a, 1990, 1991, 2008) represents one approach to cognitive linguistics. Its central claim is that grammar is per se a *symbolic* phenomenon, consisting of patterns for imposing and symbolizing particular schemes of conceptual structuring. It is held that lexicon, morphology, and syntax form a continuum fully describable as assemblies of *symbolic structures* (form-meaning pairings), and consequently, that all valid grammatical constructs have conceptual import. While quite radical from the standpoint of orthodox linguistic theory, these positions are actually both natural and desirable.

Reducing grammar to symbolic assemblies affords a major theoretical unification as well as great austerity in the kinds of entities analysts are allowed to posit. It is realistic from the psychological standpoint, for unlike semantics and phonology—grounded in the broader realms of conceptualization and sound—grammar is not connected to any independently accessible domain of experience. It is more naturally taken as residing in schematized representations of sound-meaning pairings, abstracted from (and immanent in) the specific symbolic configurations observable in complex expressions. Described in this manner, grammar (like lexicon) can be seen as directly reflecting the semiological function of language.

Although the analyses and theoretical claims of cognitive grammar are proposed and justified on the basis of linguistic evidence, some care is taken to stay within the bounds of psychological plausibility. A guiding principle is that language structure should be characterized relying only on mental abilities and phenomena that are either well known or easily demonstrated. This leads to a primary working strategy (described in Langacker 1993a) based on the convergence of three kinds of considerations.

The objective is to find descriptions of linguistic elements that simultaneously meet the conditions of being (i) reasonable from the psychological standpoint, (ii) well motivated in purely semantic terms, and (iii) optimal as a basis for analyzing grammar. In my view this methodology has proved quite successful. It is argued in various works (e.g., Langacker 1995b; van Hoek 1995) that conceptually grounded descriptions satisfying conditions (i) and (ii) support revealing accounts of classic grammatical problems. The advantages of reducing grammar to symbolic assemblies are not purchased at the expense of descriptive adequacy, but quite the contrary.

The presentation will begin by sketching a conceptualist approach to semantics. We will next consider symbolic assemblies and the gradation between lexicon and grammar. Following this will be a discussion of how cognitive grammar handles some basic problems of grammatical description.

Finally, as a case study, an attempt is made e.g., to justify (or at least render plausible) a conceptual characterization of the grammatical notions subject and object. The supposed impossibility of such a characterization is of course a central argument for the autonomy of syntax.

1. SEMANTICS

Views of grammar are critically dependent on assumptions made about semantics. In particular, the autonomy of grammar appears self-evident given the prevalent assumption that meanings consist of truth conditions. The meaningfulness of grammatical elements becomes apparent only by adopting a conceptualist semantics that properly accommodates our ability to conceive and portray the same objective situation in alternate ways. The term *conceptualization* is interpreted broadly as embracing any kind of mental experience. It subsumes: (i) both established and novel conceptions; (ii) not only abstract or intellectual “concepts” but also sensory, motor, and emotive experience; (iii) conceptions that are not instantaneous but change or unfold through processing time; and (iv) full apprehension of the physical, social, cultural, and linguistic context. Thus, far from being either static or solipsistic, conceptualization is viewed as the dynamic activity of embodied minds interacting with their environment.

Linguistic semantics has traditionally posited a definite boundary between “semantics” and “pragmatics”. It is further assumed that lexical items have fixed, well-delimited meanings (far less inclusive than speakers’ general knowledge of the entities they denote), and that sentence meanings are fully derivable from lexical meanings by rules of semantic composition. Attractive though it is, a semantics of this sort is actually quite problematic. It reflects the dubious metaphorical supposition that linguistic elements are containers from which discrete components of meaning need only be extracted and assembled in building-block fashion (cf. Reddy 1979). In practice, motivated boundaries between “linguistic” and “extralinguistic” facets of meaning have proved notoriously hard to establish.

The basic vision of *cognitive semantics* is radically different. Rather than imposing artificial boundaries, it posits a gradation between semantics and pragmatics, and also between linguistic and general knowledge. It views expressions as evoking (rather than containing) meanings, which emerge via an elaborate process of *meaning construction* drawing on all available resources—linguistic, psychological, and contextual. Even at the lexical level, meanings are variable and malleable. The *encyclopedic* approach (Haiman 1980; Langacker 1987a: §4.2; cf. Wierzbicka 1995) treats lexical items as points of entry into vast conceptual networks. While the access they afford to these networks is to some degree conventionally established, it is nonetheless flexible, open-ended, and highly subject to priming. To the extent that distinct paths of access become entrenched and conventionalized, the result is the common situation of *polysemy*, where a lexical item has a number of related senses, any one of which might be activated on a given occasion. These senses form a *complex category* describable as a network, usually centered on a prototype (Lakoff 1987; Langacker 1987a: ch. 10; Taylor 2004).

At higher levels of organization, the essential role of meaning construction is even more evident. Multifaceted research in cognitive semantics has demonstrated that the meanings of

complex expressions are not in general algorithmically derivable from their parts—at least given a representative range of data (not selected just to avoid the problem) and a realistic definition of “meaning” (not so impoverished as to be trivial in relation to natural language understanding). Patterns of semantic composition do of course exist (they are considered an inherent aspect of grammar) and their importance is undeniable. Still, since language is neither autonomous nor encapsulated, semantically it exhibits only *partial compositionality*. The meanings contributed by lexical and grammatical elements evoke and constrain—but do not fully constitute—the overall conceptualization evoked by a complex expression, its composite semantic structure. This is an entity in its own right with many possible sources of extracompositionality.

It may, for instance, be crucially dependent for its coherence on discourse or contextual clues to supplement the fragmentary information explicitly encoded. It may invoke domains of knowledge not accessed by any component element taken individually. It is likely to require the construction and manipulation of an elaborate set of connected *mental spaces* (Fauconnier 1985; Fauconnier and Sweetser 1996). Almost certain to be involved are basic and ubiquitous phenomena such as *metaphor* (Lakoff and Johnson 1980; Lakoff and Turner 1989), *metonymy* (Langacker 1995b; Nunberg 1995), and *conceptual blending* (Fauconnier and Turner 1994, 1996, 2002). It might then seem attractive to distinguish between *evoked* and *encoded* meaning, equating semantic structure with just the latter (Harder 1996). The feasibility of such a move is anything but obvious, however. There is no clear boundary between evoked and encoded meaning, nor is the latter necessarily either independently coherent or separately apprehended.

Fundamental to cognitive semantics is *construal*, our manifest capacity for conceptualizing the same situation in alternate ways. At least for mortals, construal is inescapable—there is no completely neutral way of apprehending a situation (though there are of course defaults). Meaning is thus a function of both conceptual “content” and how that content is construed.

As an inherent aspect of their conventional semantic value, linguistic elements impose a particular construal on the content they evoke, and speakers adopt it for purposes of linguistic expression. Differences in conventional patterns of construal are largely responsible for the impression that languages embody contrasting “world views”. A strong claim of linguistic relativity, that language drastically and unavoidably shapes thought, is not however warranted. The effect of linguistically imposed construal may be fairly superficial (Slobin 1987). The content evoked by expressions can be largely the same (affording the basis for understanding and rough translation) even when they construe it very differently. Moreover, the symbolic resources of a single language provide an enormous range of options for construing any given situation, and speakers show great dexterity in shifting from one to another.

One dimension of construal is “granularity”, i.e., the degree of precision and detail with which a situation is characterized. The lexicon of a language allows an entity to be described at varying levels of *specificity* (conversely, *schematicity*), the choice depending on circumstances and communicative objectives. For instance, the same feline might be described specifically as a *Siamese*, more abstractly (in coarser-grained detail) as a *cat*, and still more schematically with terms like *animal*, *creature*, or even *thing*. Complex expressions obviously allow indefinite variation along this parameter, as illustrated by the progressively more schematic descriptions in (1):

- (1) Your wretched Siamese just gobbled up my crème brûlée. > Your cat just ate my dessert. > An animal did something. > Something happened.

The meanings of grammatical elements are usually quite schematic (cf. Talmy 1988). This does not distinguish them sharply from lexical items, since the latter range widely along the dimension of specificity. There is rather a gradation, such that the more schematic an element is semantically, the more likely it is to be regarded by linguists as grammatical rather than lexical.

Numerous aspects of construal reflect a very general ability to conceive of one structure against the *background* provided by another. One kind of background consists of assumptions, expectations, and presuppositions, which expressions evoke with varying degrees of explicitness and specificity. Consider the sentences in (2), which might be used to describe the same objective situation.

- (2) (a) He has published few articles in refereed journals.
(b) He has published a few articles in refereed journals.

In (2)(a), *few* indicates that the quantity of articles is less than anticipated. By contrast, *a few* in (2)(b) assumes a baseline of zero and specifies a small departure from it in a positive direction. The difference between a negative vs. a positive displacement from a presupposed value is not without grammatical consequences. Observe that *any* co-occurs with *few*, but not with *a few*:

- (3) (a) He has published few articles which make any sense.
(b) *He has published a few articles which make any sense.

It is well known that *any* requires a negative context (e.g., *He doesn't have any money*, but **He has any money*). Its distribution in cases like (3) is thus sensitive to how the objective situation is construed in terms of background expectations.

The previous discourse constitutes an essential background for the current expression. Most obviously, previous specification in the discourse allows entities to be referred to more schematically than when they are first introduced:

- (4) My psychiatrist would prefer to interview patients in her own study. However, she never actually does it there.

Less often noted is the fact that expressions judged ungrammatical and semantically anomalous when considered in isolation often appear coherent, natural, and grammatically well formed when situated in the appropriate discourse context. For instance, while linguists would normally append an asterisk (for ungrammaticality) to a sentence like (5)(a), it seems perfectly appropriate when uttered in response to (5)(b).

- (5) (a) (*)I think diced slightly tipsy.
(b) Is there any way of preparing them so that Cedric might be willing to eat carrots while in any conceivable mental state?

It is a basic principle of cognitive linguistics that well-formedness judgments always presuppose some context, if only an implicit one based on default assumptions.

Another background phenomenon is metaphor, in which a *target domain* is construed in relation to a *source domain*. A theory, for example, can be viewed metaphorically as a building, an airplane, or even as a bucket (Lakoff and Johnson 1980):

- (6) (a) His theory rested on such poor foundations that, despite all his attempts to buttress it, it finally just collapsed.
- (b) Your theory just won't fly; in any case, it could be shot down by any half-way competent linguist.
- (c) That theory is full of holes; it won't hold water.

Categorization can also be considered a background phenomenon, in that the target is interpreted as instantiating a particular pre-existing conceptual frame. Even if the objective behavior is just the same, it makes a difference whether contributions to a political candidate are construed as *gaining access* or *buying influence*.

Numerous dimensions of construal can be grouped under the rubric of *perspective*. The most obvious is the *vantage point* from which a situation is conceptualized. Thus (7)(a), with *come*, implies that the speaker is in the attic, while *go* in (7)(b) implicates the opposite.

- (7) (a) Why don't you come up into the attic?
- (b) Why don't you go up into the attic?

Of course, speakers display great agility in recognizing other vantage points and mentally adopting them for expressive purposes. In (8)(a), for instance, the use of *come* conveys empathy and solidarity by indicating that the speaker is adopting the vantage point of the addressee.

- (8) (a) I'll come to your place Tuesday morning.
- (b) Ellen was writing furiously. Tomorrow was the deadline for the manuscript.

In (8)(b), the second sentence is readily interpreted as reflecting Ellen's vantage point rather than the speaker's. The incongruity of using *tomorrow* with a past-tense verb signals this transfer to the mental space representing Ellen's consciousness at the time of writing.

Another aspect of perspective is the overall *viewing arrangement* an expression presupposes. This is best illustrated by a classic example due to Len Talmy:

- (9) There's a cottage every now and then through the valley.

A cottage is not the sort of thing that goes in and out of existence, as suggested by the adverbial phrase *every now and then*. Nor is anything explicitly described as moving, as suggested by the path phrase *through the valley*. On the face of it, then, the sentence ought to be semantically and grammatically incoherent. Yet we immediately and easily understand it as making perfect sense. In contrast to the default of a static viewer reporting on a series of events, it presupposes the special arrangement in which a moving viewer describes what appears in the "viewing frame" (e.g., the window of a vehicle) during a journey. *Every now*

and then pertains to the frequency of a cottage being observed in that frame. Likewise, *through the valley* describes the path followed by the moving observer. Note, however, that the sentence makes no explicit reference to the mover, the journey, or the viewing activity. These notions have to be supplied by the conceptualizers (i.e., the speaker and the addressee), who create the basis for semantic and grammatical coherence by engaging in an active process of meaning construction.

A distinct but related phenomenon involves the conceptualizer traversing a static situation by means of “fictive” or “subjective” motion (Langacker 1986; Matsumoto 1996a, 1996b; Talmy 1996). The contrast in (10), for example, depends solely on the direction of *mental scanning*, as indicated by the prepositional phrases.

- (10) (a) An ugly scar runs all the way from his knee to his ankle.
(b) An ugly scar runs all the way from his ankle to his knee.

Mental scanning of this sort is by no means limited to spatial configurations but can be manifested in any conceptual domain:

- (11) (a) The prices on this model run from about \$18,000 all the way to \$27,000 depending on optional equipment.
(b) As average body size increases, the typical gestation period gets longer.

The sentences in (10) and (11) all describe situations that are locally stable with respect to the actual passage of time. The sense of movement and directionality reflects the order in which a range of options (spatial or otherwise) are mentally accessed by the conceptualizer in the process of building up to the full apprehension of a complex structure.

Lastly, our capacity for construal comprises various ways of rendering certain entities more *prominent* than others. Numerous types of prominence need to be distinguished for linguistic purposes. One kind of prominence attaches to elements that are new in relation to what has already been established in the discourse. Collectively called the *focus*, these elements stand out against the background of information said to be *old* or *given*. In English, focus is generally marked by unreduced stress (indicated here by small caps):

- (12) He said she was wearing a white blouse with black polka dots, but actually she was wearing a white SWEATER with black STRIPES.

Rather different is the inherent cognitive salience of certain kinds of entities and experiential domains. Examples include the salience of a whole relative to its parts, the special status of animate entities (especially humans) in relation to inanimate objects, that of physical entities as opposed to abstractions, and the psychological primacy of visual and spatial experience.

Among the linguistic manifestations of these salience asymmetries are the usual directions of metaphor and metonymy. It is well known, for instance, that abstract notions tend to be structured metaphorically in terms of source domains pertaining to physical experience, as in (6). Some cases of metonymy are given in (13). In (13)(a), *a whole turkey* refers metonymically to the turkey’s edible flesh; presumably the bones, feathers, and other sundry parts were not consumed.

- (13) (a) For Thanksgiving we ate a whole turkey.
 (b) I'm in the phone book.

The metonymic use of the pronoun *I* in (13)(b) illustrates the inherent salience of humans as well as physical entities. Under normal circumstances it would actually only be a graphic representation of the speaker's name, address, and telephone number that appears in the phone book.

Especially important for grammar are two kinds of prominence intuitively describable as involving the focusing of attention. The first, called *profiling*, characterizes expressions of any size or type. Within the full conceptualization it evokes, an expression directs attention to some particular substructure—its *profile*—as being the entity that it designates or refers to. An expression's profile is thus its “referent”, in a psychological (as opposed to a logical or philosophical) sense of that term.

The noun *lid*, for example, evokes the conception of a container together with a cover serving to close an opening in its top, as sketched in Figure 1(a). This entire conception is necessary, since a lid can be identified as such only in relation to a container and its covering/closing function. Yet the full conception is not per se the meaning of *lid*, since a lid is not equivalent to a container-cover assembly.

A crucial semantic property of *lid* is that, within this assembly, it specifies the cover in particular as being its referent. The cover is thus its profile, as shown in Figure 1(b). In the diagrammatic representations of cognitive grammar (which are heuristic rather than formal), profiling is indicated by heavy lines.

An expression can profile either a *thing* or a *relationship* (assuming abstract and broadly inclusive definitions of those terms—see Langacker 1987b). Consider the words *advise*, *advisor*, and *advisee*. As shown in Figure 2, they evoke the conception of two individuals engaging in a particular kind of verbally mediated social and psychological interaction. A dashed arrow represents this experiential relationship, its alignment indicating the primary direction of influence. Note that this entire conception figures in the meaning of all three expressions: a person does not qualify as an advisor or advisee except by virtue of participating in an interaction of this sort, nor can one conceive of the advising process without conceptualizing its participants. Since *advise*, *advisor*, and *advisee* have the same conceptual content, the semantic contrast among them resides in profiling, an aspect of construal. The verb *advise* profiles the relationship, including the participants essential to its conception. On the other hand, the nouns *advisor* and *advisee* profile only the respective participants, identified and distinguished by their role in the process.

Figure 1. The effect of profiling.

Figure 2. The profiling of a relationship vs. the profiling of its participants.

Figure 3. Expressions that differ in trajector/landmark alignment.

Such examples clearly demonstrate that an expression's meaning depends on both content and profiling. Yet these alone are not sufficient. We can see this from semantic oppositions like *above* vs. *below*, diagrammed in Figure 3. Both expressions designate a spatial relationship between two things (shown as circles) occupying different positions along the vertical axis. They thus evoke the same conceptual content. Moreover, they have the same profile (represented by the heavy dashed arrows)—referentially, an *above* relationship is also a *below* relationship. Some other factor must therefore be responsible for the contrast in meaning. This factor, a final dimension of construal, is the relative prominence accorded the participants in a profiled relationship. In a relational expression, there is usually a participant that stands out as the one being located or characterized, or whose activity is being followed. Called the *trajector* (*tr*), this entity can be described as the primary figure in the scene. Often a second participant, called the *landmark* (*lm*), stands out as a secondary figure. The semantic contrast between *above* and *below* resides in whether the upper participant is focused as trajector and the lower one as landmark, or conversely. If I say, for example, that *The knob is above the keyhole*, I am using the keyhole as a spatial landmark to specify the location of the knob. I do the opposite in saying that *The keyhole is below the knob*. Observe, however, that the notions trajector and landmark are not defined spatially, but as a matter of focal prominence, hence they are applicable to any kind of relationship. In Figure 2(a), for instance, the source and the target of advice are respectively identified as the trajector and landmark of *advise*.

2. LEXICON AND GRAMMAR

Both lexicon and grammar are claimed to be fully and properly describable as assemblies of symbolic structures. The term “symbolic” does not imply operations on strings of empty

markers (as when “symbolic processing” is contrasted with connectionist approaches). On the contrary, it refers to the semiological function of language and the symbolization of meanings by phonological sequences. In cognitive grammar, a *symbolic structure* is defined as consisting in the association between a *semantic structure* and a *phonological structure*—its semantic and phonological *poles*. Every lexical and grammatical element is thus attributed some kind of semantic and phonological value, whether specific or schematic.

Lexicon is defined in cognitive grammar as the set of fixed expressions in a language, regardless of their size or type. Each lexical item is an assembly of symbolic structures. A morpheme can be regarded as a minimal symbolic assembly, degenerate by virtue of having no symbolic substructures. The morpheme *door*, for example, can be given as [DOOR/door], where upper- and lower-case orthographic sequences respectively stand for semantic and phonological structures. The lexical unit *garage door* is more typical in being symbolically complex. As shown in Figure 4 (where dashed-line boxes delimit complex assemblies), it comprises two component symbolic structures, [GARAGE/garage] and [DOOR/door], together with the symbolic structure defined by the composite form and meaning of the overall expression: [GARAGE DOOR/garage door]. At a higher level of organization, this entire assembly combines with *opener*, itself complex, to form the lexical unit *garage door opener*. There is clearly no inherent upper limit on the symbolic complexity expressions can exhibit. A lexical item is “fixed” in the sense of being learned by individual speakers and conventional within a certain speech community. Since both are matters of degree, there is no strict boundary between lexical items and “novel” expressions. The latter, of course, are usually novel only in limited respects. How much is actually novel in the sentence *The garage door opener is broken*, for example? *Garage door opener* comes prepackaged as a lexical unit, and for those who have such a device, the full noun phrase *the garage door opener* is probably a familiar expression. Moreover, although the phrase *is broken* is not traditionally considered a lexical item, a typical speaker has used it on many occasions and may very well store it as a prefabricated unit. The truly novel aspect of the sentence may in fact be limited to combining *the garage door opener* and *is broken* as subject and predicate. More generally, the fluency of real-time speech may only be possible owing to the substantial proportion of boilerplate language and standard expressive schemes it employs.

Figure 4. A lexical item with levels of symbolic complexity.

Both fixed and novel expressions consist of symbolic assemblies, of any potential size, at least partially constructed in accordance with regular grammatical patterns. Either are capable of diverging from such patterns, especially at the semantic pole, where an elaborate process of meaning construction may intervene between the meanings of component elements and the composite semantic value. In the case of a lexical item, deviations from regularity and strict compositionality are accepted as part of its linguistic characterization, since the entire assembly is familiar and conventional (by definition). With novel expressions, where this is not so (at least not yet), comparable deviations are normally regarded by linguists as involving ungrammaticality or facets of meaning that are extralinguistic (hence beyond the scope of semantics). But the difference is more apparent than real, hinging only on degree of entrenchment and conventionality. The standard doctrine that lexical items are idiosyncratic and semantically unpredictable, whereas novel expressions are regular and semantically compositional, does not stem from any empirical finding but rather from a tacit decision to consider only those facets of the latter that are already sanctioned by established convention.

Be it fixed or novel, a linguistic *expression* is a symbolic assembly whose composite structure is specified in enough detail—particularly at the phonological pole—that it can actually be uttered and understood. Linguists, however, are less interested in expressions per se than in the patterns and regularities they instantiate. In cognitive grammar, linguistic generalizations (the functional equivalent of “rules”) are simply *schemas* abstracted from occurring expressions. A schema is a template representing the coarse-grained commonality exhibited by a set of expressions with respect to some facet of their structure. It is reasonably supposed that schemas are *immanent* in their instantiating expressions, and emerge as cognitive entities by reinforcement of the structural properties they share at a certain level of abstraction. We have already noted degrees of schematization for semantic structures (e.g., in (1)). Moreover, since linguists are concerned with phonological structures as mental representations (not just as actual sounds), these too are susceptible to schematization. Schematized symbolic structures constitute grammar.

Cognitive grammar is highly restrictive and very down-to-earth in regard to the kinds of structures it allows in linguistic descriptions. On the one hand, it specifies that only semantic, phonological, and symbolic structures are permitted. Thus every linguistic element contributes directly to the semiological function of language by virtue of having some kind of semantic and/or phonological value. On the other hand, cognitive grammar imposes strong restrictions on the relation between linguistic structures and the primary data of occurring expressions. It specifies that the only structures validly posited are those which figure directly in the data (i.e., actual expressions and their parts), or which emerge from the data via the basic cognitive processes of abstraction (schematization) and categorization. To take a phonological example, particular segments such as [m], [n], and [ŋ] can be posited because they occur as parts of actual expressions. Permitted as an abstraction from these elements is the schematic segment [N], i.e., a nasal consonant unspecified as to place of articulation. It represents the generalization that nasal consonants occur in the language, and embodies the commonality that makes them a natural phonological class. Also permitted are the categorizing relationships identifying each nasal segment as an instance of that class: [[N] → [m]], [[N] → [n]], and [[N] → [ŋ]]. Similarly, we can posit the semantic structures [LID], [DOOR], and [CAP], permitted because they occur as the respective meanings of *lid*, *door*, and *cap*. Also allowed is the schematized conception they all instantiate, [COVER FOR OPENING], as well as categorizations such as [[COVER FOR OPENING] → [LID]].

The most striking and controversial claim of cognitive grammar is that these same few possibilities—applied to symbolic structures—are sufficient for a full and optimal account of lexicon, morphology, and syntax. Note first that lexical items are permitted in a linguistic description by virtue of being actual, recurring expressions. As shown in Figure 4, these include symbolic assemblies of any size, some of which function as components of others. Also permitted are schematizations of occurring expressions (not limited to lexical items). These schematic symbolic assemblies, potentially having any degree of complexity, embody the coarse-grained commonality inherent in sets of expressions. Such assemblies constitute grammatical structure, and their categorization of specific expressions (both fixed and novel) constitutes the structural characterization of those expressions.

Consider expressions like *jar lid*, *pot lid*, *box lid*, and *coffin lid*. Each is an assembly comprising two component symbolic structures (e.g., [JAR/jar] and [LID/lid]) together with the composite symbolic structure giving the meaning and form of the expression as a whole (e.g., [JAR LID/jar lid]). Although they vary in their frequency of occurrence and lexical status, they exhibit a structural parallelism that provides a basis for schematization. The resulting schema, which we can abbreviate as *CONTAINER lid*, represents a particular low-level pattern of forming nominal compounds. Higher-level abstractions are of course possible, such as the general schema for noun-noun compounds like *door knob*, *desk clerk*, *tomato juice*, *broom handle*, *luggage strap*, *movie star*, *tooth filling*, *cab driver*, *fire alarm*, *dust rag*, *computer virus*, etc. This highly schematic assembly—call it *THING THING*—is instantiated by *CONTAINER lid* and numerous other subschemas describing special cases of the general pattern. We can therefore posit schematic hierarchies, e.g., *THING THING* → *CONTAINER lid* → *jar lid*.

We must further recognize *extensions* from a basic pattern. Thus *eyelid* is an instance of *THING THING* but an extension vis-à-vis *CONTAINER lid*, for an eye is not a container: *CONTAINER lid* ---> *eyelid*. It is quite typical for the full description of a grammatical construction to involve a substantial number of constructional variants. These are characterized at different levels of specificity and linked by categorizing relationships to form a network, often centered on a prototype (Goldberg 1995; Janda 1990; Lakoff 1987: case study 3). The same can be said for the alternate senses of a polysemous lexical item, and indeed, for linguistic categories in general (Langacker 1987a: ch. 10, 1988).

3. GRAMMATICAL STRUCTURE

Why should there be such a thing as grammar? It would not exist were lexical units available to symbolize every conception one would want to express. However, lexical items form a limited set, whereas the conceptions we wish to encode linguistically are open-ended and indefinitely varied. We overcome this by resorting to complex expressions comprising multiple lexical elements. Each component element evokes some facet of the overall conception, a facet singled out precisely because it is susceptible to individual lexical encoding. Collectively, these individually symbolized conceptual “chunks” provide enough clues about the composite conception intended by the speaker that the addressee (especially in context) is able to reconstruct some approximation to it. But this reconstruction cannot

proceed effectively without some kind of systematic indication of how the conceptual chunks are supposed to fit together. The role of grammar is to provide this information.

We can start by examining a specific symbolic assembly, namely *jar lid*, sketched in Figure 5. The composite structure is shown at the top, the two component structures below. At the semantic pole, *lid* profiles the cover to a schematic container, *jar* profiles a specific container, and *jar lid* profiles the cover to a container of that type. (The pictorial representations are only mnemonic; they have to be understood as abbreviating multifaceted conceptualizations.) Phonologically, the components *jar* and *lid* are single words (W), the composite expression being a two-word sequence with accent on the first. The component and composite structures form an assembly by virtue of *correspondences*, represented diagrammatically by dotted lines. In particular, a semantic correspondence equates the profile of *jar* with the schematic container evoked by *lid*, while at the phonological pole *jar* is identified with the word directly preceding *lid*. When elements of the component structures correspond, they project to the same composite structure element. Correspondences can thus be regarded as instructions for “integrating” components to form the composite structure.

The specific symbolic assembly in Figure 5 instantiates schematized assemblies such as *CONTAINER lid* and *THING THING*, describing conventional compounding patterns at different levels of abstraction. The schema describing the general pattern is depicted in Figure 6. Phonologically, it indicates word order and the characteristic stress pattern of compounds without specifying any particular segmental content. At the semantic pole, the component and composite structures are characterized abstractly as profiling things (represented by circles).

The profile of the first component corresponds to a thing associated in some unspecified fashion with the profile of the second, which also prevails as the composite structure profile. The correspondences inherited from the sanctioning schema indicate how the conceptual “chunks” provided by the component structures are supposed to be combined in forming the composite semantic structure. Typically, however, the composite structure incorporates extracompositional properties and therefore has to be recognized as an entity in its own right.

Figure 5. Details of a specific symbolic assembly.

Figure 6. Details of a schematic symbolic assembly.

For instance, compounds like *lipstick* and *apple polisher* evoke conceptual “frames” not associated with either of their component elements taken individually (cf. Downing 1977; Ryder 1994). Neither *lip* nor *stick* by itself reliably evokes the cultural practice of females coloring their lips with a paint-like substance packaged in a stick-like shape. Although this cultural frame is necessary for the conceptual coherence of *lipstick*, it is neither mechanically determined nor fully constituted by the individual meanings of *lip* and *stick*, which explicitly encode only selected aspects of it. Semantics is only partially compositional: conventional patterns of composition (the semantic poles of schematic symbolic assemblies) are only one of the factors in the process of meaning construction that intervenes between component and composite conceptions in complex expressions. Compositional rules do not function in isolation, nor does their fully compositional “output” necessarily exist or have any independent cognitive status.

If the basic idea of symbolic assemblies is clear, it must next be asked whether they are able in principle to provide a full account of grammatical structure. Can they actually accommodate the various phenomena generally interpreted as demanding that grammar be treated autonomously? By way of partial demonstration that they can, let us briefly consider some fundamental problems: grammatical classes, grammatical markers, constituency, and distributional restrictions. An additional problem, how to characterize the grammatical relations subject and object, is the topic of section 5.

To this very day, standard linguistic doctrine holds that basic grammatical classes (noun, verb, adjective, etc.) are not semantically definable. The arguments are anything but conclusive, however, for they consider only the most simplistic semantic characterizations and completely ignore our ability to impose alternate construals on the same conceptual content (see, for instance, Jackendoff 1994: 68-69). It is argued, for example, that since not every noun names a physical object, and not every verb names an action, these classes cannot be defined on the basis of any meaning their members all share. The impossibility of a semantic definition is also argued on the grounds that expressions with the same meaning sometimes belong to different grammatical classes, e.g., *explode* (a verb) and *explosion* (a noun). But it should be evident that if all nouns have something in common semantically, or

all verbs, it must be more abstract than notions like ‘physical object’ and ‘action’ (which do however describe the category prototypes), and must be independent of any specific conceptual content. A viable conceptual characterization should instead be sought at the level of general cognitive abilities, in particular our capacity to conceive of the same situation in alternate ways. Category membership does not reflect conceptual content so much as the construal imposed on it.

What sort of cognitive abilities might be invoked in a conceptual characterization of the noun class? One is profiling. As we saw in Figure 2, the words *advise*, *advisor*, and *advisee* have basically the same conceptual content, the semantic contrast residing in their choice of profile. It is in fact the nature of an expression’s profile—not its overall content—that determines its grammatical class. *Advise* is thus a verb because it profiles a certain kind of relationship, whereas *advisor* and *advisee* are nouns because they profile “things” (identified by their role as participants in that relationship). The claim, then, is that a noun profiles a *thing*, in an abstract and broadly inclusive sense of that term. This is the conceptual property that all nouns have in common, and they are nouns precisely because they have this property.

But what is a “thing”? My working hypothesis is that a thing is the product of two fundamental and ubiquitous cognitive phenomena. The first is *grouping*, whereby entities are singled out and conceived in relation to one another, to the exclusion of others. Most familiar are the gestaltist principles of grouping by contiguity and similarity. In viewing (14)(a) we can hardly avoid forming groups of two and three x’s on the basis of contiguity, while in (14)(b) similarity affords a basis for singling out certain entities (the x’s) which can then be grouped by proximity.

- (14) (a) x x x x x
 (b) - - - x - x - x - x - - - - - x - x - x - x - - - - - x - x - x - x - - -

We can also recognize more abstract bases for grouping. For instance, the members of an orchestra are mentally grouped because they are conceived as interacting to collectively fulfill a certain function. A number of stars are grouped to form a constellation because they are conceived as points in the outline of a schematic image. The second relevant phenomenon, call it *reification*, is the manipulation of a group as a unitary entity for higher-level cognitive purposes. In (14)(b), for example, I reify the groups of x’s when I count them, observe that all three are the same, note that they form a straight line, etc. I reify an orchestra when I compare it to another in size or quality, or when I think of it as joining with others to form an orchestra association (a higher-level group).

A “thing” is thus defined as any product of grouping and reification, and a noun is characterized as an expression that profiles a thing. Large numbers of nouns are straightforwardly describable in this manner: *group*, *team*, *club*, *stack*, *pile*, *alphabet*, *archipelago*, *swarm*, *herd*, *jigsaw puzzle*, *chess set*, *lexicon*, *bouquet*, *collection*, *orchard*, *chord*, *squad*, *galaxy*, and so on indefinitely. Each such noun designates a set of constitutive entities that obviously are grouped and conceptually wielded as a single unit for linguistic and other purposes. I suggest that the same description applies to physical objects, even those whose constitutive entities are nothing more than arbitrarily delimited “splotches” of material substance continuously distributed throughout a certain expanse of space. The splotches constituting a *rock*, for example, are neither individuated nor consciously recognized, yet the very apprehension of their continuous extensionality effects their grouping to yield the

conception of a unitary object. The reason physical objects are prototypical for nouns is that the grouping and reification of their constitutive entities is so basic and automatic that any awareness of them requires subsequent, higher-level analysis. I have argued elsewhere (Langacker 1987b, 1991: ch. 1) that mass nouns, abstract nouns, and others also conform to this general description.

I have no definite proof for this conceptual characterization of nouns. If basically correct, it will nonetheless have to be refined, properly formulated, and empirically tested from the psychological standpoint by those with proper expertise. It is merely offered as a coherent proposal with some claim to linguistic adequacy and cognitive plausibility. Even so, by indicating what a viable conceptual description of nouns might look like, it underscores the simplistic nature of standard arguments for the impossibility of a semantic definition. I personally find it hard to imagine that fundamental and universal categories like noun and verb would not have a conceptual basis (cf. Gentner 1981, 1982; Kellogg 1994, 1996). As a general matter, I believe that such categories reflect inborn cognitive abilities that are initially manifested in the category prototype and become more apparent when extended to other kinds of circumstances. (This is not in principle incompatible with an account based on metaphor, e.g., the notion that nominal referents are metaphorically construed as physical objects.)

The prototype for verbs is an action, i.e., an event producing observable change carried out by a volitional agent. The more schematic conception which verbs all share, I suggest, is that of a relationship mentally scanned sequentially—instant by instant—in its evolution through time. I refer to this as a *process*. Every verb is thus said to profile a process, just as every noun profiles a thing. Other basic classes, such as prepositions and adjectives, are characterized as profiling different sorts of relationships viewed “holistically”, in the sense that their evolution through time is not in focus. A preposition like *above*, for instance, profiles a non-processual relationship with a thing as its landmark (Figure 3); while this relationship is likely to endure through time, its temporal evolution is not essential to its description or identification (it can be identified in a configuration viewed only instantaneously). An adjective profiles a relationship with a thing as trajector but no salient landmark. The adjective *square*, for example, profiles a complex relationship—involving length of sides, parallelism, perpendicularity, etc.—holding among various facets of its trajector. (As a noun, *square* profiles a thing consisting of connected line segments whose configuration instantiates the relationship profiled by the adjective.) Participles and infinitives derive from verbs, hence they evoke the conception of a process, but in one way or another they construe it holistically to form a higher-level conception that is non-processual. For instance, one kind of past participle restricts the profile of a change-of-state verb to the final state resulting from the change. Thus, whereas the verb *melt* profiles the process of a solid (its trajector) gradually becoming liquid, the participle *melted* profiles just the latter situation. By virtue of profiling a single-participant, non-processual relationship, such participles actually qualify as adjectives and behave that way grammatically (e.g., *melted ice cube*; *The ice cube is finally melted*).

Standard linguistic doctrine notwithstanding, I see nothing problematic or inherently implausible about the notion that the members of a basic grammatical class all share an abstract commonality. It is thus proposed that every noun instantiates the symbolic schema [THING/...] (i.e., it profiles a thing, but need not have any particular phonological properties). Likewise, every verb instantiates the schema [PROCESS/...]. While class membership is

usually taken as demonstrating the need for irreducible grammatical primitives, it is coherently and more naturally seen as residing in categorizing relationships between specific and schematic symbolic structures: [[THING/...] → [EXPLOSION/explosion]]; [[PROCESS/...] → [EXPLODE/explode]]. It needs to be emphasized that these characterizations do not invoke any specific conceptual content. The schematic conception immanent in all nouns, or in all verbs, is primarily a matter of construal: a noun profiles a product of grouping and reification, while a verb profiles a relationship whose temporal evolution is scanned sequentially. These alternate modes of construal can perfectly well be applied to the same conceptual content, resulting in a difference in grammatical class. If *explode* and *explosion* evoke the same basic conception, they nonetheless impose distinct construals on it. As a verb, *explode* construes the event as a dynamic process and simply tracks its occurrence through time. On the other hand, the noun *explosion* profiles an abstract “thing” created by the reification of such a process. Its constitutive entities are the successive phases of the process (i.e., the situations obtaining at each successive point in time), and the very act of scanning through them sequentially provides the basis for their grouping. Hence *explosion* designates a reified event consisting of one instance of the process *explode*.

As this example indicates, the semantic import of grammar is largely a matter of the construal it imposes on the content supplied by lexical elements (cf. Talmy 1988). The reason why the meaningfulness of grammar is not generally recognized is that semantics has not generally acknowledged the critical role of construal. Especially in the formalist tradition, linguists have consequently analyzed many elements as “purely grammatical” markers whose meaning is ignored and often explicitly denied. I have argued, to the contrary, that all grammatical markers have at least schematic conceptual import, and have proposed and justified particular meanings for a substantial number of representative instances (e.g., Langacker 1990, 1991, 1992). Semantically, such markers are comparable to the schemas describing grammatical classes. As overtly realized grammatical markers, however, they differ from class schemas by virtue of being phonologically specific.

Consider the auxiliary verb *do*, which occurs with negation (*I do not see them*), in questions (*Did you wash it?*), and for emphasis in statements (*I DO love you!*). It is often viewed as meaningless, being inserted just for grammatical purposes (e.g., in Chomsky 1957). However, the fact that *do* serves a grammatical function does not entail that it has no meaning (cf. Reid 1991). It is cogently analyzed as a maximally schematic verb, i.e., one whose semantic pole is equivalent to the verb-class schema despite its phonological specificity: [PROCESS/do]. This accounts for its taking verbal inflection, and also for its use as a kind of verbal anaphor: *Can you fix it? I already did*. One reason *do* appears to have no meaning is that it refers schematically to the same process that the lexical verb it combines with describes in more specific terms, hence it contributes no additional content. Yet semantic overlap is characteristic of all grammatical constructions (see Figure 6), and full inclusion is just an expected limiting case.

Most derivational and inflectional morphemes are reasonably described as being schematic for the class they derive, their semantic contribution residing in the construal they impose on the stems they combine with, especially in regard to profiling. For example, the derivational morphemes *-er* and *-ee* profile things characterized only by their agent- or patient-like role in a schematically specified process; they impose this nominal profile on the specific process designated by the verb stem they attach to. I would thus describe *-er* and *-ee* as schematic agentive and patientive nouns, which forms like *advisor* and *advisee*

respectively instantiate. By the same token, the nominalizing morpheme *-ion* (as in *explosion*) profiles a thing characterized as the reification of a schematic process, and the past participial morpheme *-ed* (as in *melted*) profiles the state resulting from a schematic change-of-state process. Of course, these same elements have alternate semantic values—just like other lexical items, grammatical markers are often polysemous. (For the polysemy of *-er*, see Ryder 1991.)

We have so far discussed how certain basic grammatical phenomena—namely rules, classes, and markers—are in principle describable in terms of symbolic assemblies. Other phenomena commonly taken as supporting the autonomy of grammar include constituency as well as the problem of “distribution” or “structure dependency”, i.e., arbitrary restrictions on the structural contexts in which elements are allowed to occur. In fact, however, the symbolic view of grammar readily handles them both.

To represent constituency, generative grammar posits syntactic phrase trees in which lexical items are “inserted” and function as terminal nodes. These tree structures are thought of as purely grammatical entities essential to syntactic description. While they may play a role in semantic and phonological interpretation, the trees themselves draw on syntactic primitives and have no intrinsic semantic or phonological value. Three kinds of information are represented in these phrase trees: constituency, grammatical category (given by node labels), and linear order. All of these are clearly important for grammar. Only the status of phrase trees as autonomous syntactic objects is being called into question.

Constituency per se is hardly unique to grammar. It is just a matter of component elements being incorporated as facets of more complex structures at successively higher levels of organization. As such, it is evident in virtually every domain of experience: in motor experience, where component routines are coordinated into higher-level routines (as in learning to type); in perception, as in (14)(b), where *x*’s cluster into groups of four, which can then be perceived as forming a cluster of three such groups; and so on. Constituency emerges in symbolic assemblies when a composite symbolic structure at a given level of organization functions in turn as a component structure at a higher level. For example, we see in Figure 4 that [GARAGE DOOR/garage door] and [OPENER/opener], each a composite structure with respect to its morphemic components, are themselves component structures with respect to the overall composite structure [GARAGE DOOR OPENER/garage door opener]. To the extent that they have this kind of hierarchical arrangement, symbolic assemblies are reasonably depicted as trees in the manner of Figure 4. These trees are quite different from the phrase trees of generative grammar, however. Most importantly, every “node” is symbolic, having both a semantic and a phonological value, whereas the nodes of a generative phrase tree have neither.

Another difference is that the components of a symbolic assembly are not linearly ordered with respect to one another (hence assemblies like Figure 4 are more like mobiles than trees). Linear ordering is actually the temporal ordering of speech. While temporal ordering is exploited for the symbolization of grammatical relationships, it is properly regarded as a dimension of phonological structure. Temporal sequencing is therefore specified internally to every component and composite symbolic structure, as an inherent aspect of its phonological characterization (e.g., the phonological pole of [GARAGE DOOR/garage door] specifies that *garage* directly precedes *door* in the temporal sequence). In similar fashion, grammatical category—which phrase trees indicate by means of node labels—is properly regarded as an inherent aspect of a symbolic structure’s semantic

characterization. In Figure 5, for instance, the component and composite structures of *jar lid* are all classed as nouns because each profiles a thing (the noun-class schema is immanent in each of them).

We see, then, that the kinds of information represented in phrase trees are all available in symbolic assemblies as different aspects of their intrinsic organization. Interpreted as distinct and autonomous syntactic objects, phrase trees are therefore held to be unnecessary theoretical artifacts, a product of linguistic gerrymandering. Moreover, cognitive grammar views constituency as being less essential than does generative theory, and also more fluid and variable (Langacker 1995a, 1997a). Phenomena for which syntactic phrase trees per se have been considered indispensable (e.g., the definition of subject and object, discussed in section 5) are claimed to be better analyzed in other ways.

Turning now to distributional problems, I must first offer a point of clarification concerning grammatical classes. The claim that such classes are susceptible to schematic semantic descriptions valid for all members is specifically intended for basic and universal classes like noun and verb, for their major subclasses (e.g., count vs. mass noun), and for certain other “part-of-speech”-type classes (such as adjectives, adpositions, and particular kinds of participles). It is definitely not asserted that every class a linguist might validly posit is definable in this manner. Such a claim would obviously be untenable for many distributional classes, consisting of the lexical items conventionally allowed to participate in a given syntactic, morphological, or even phonological pattern. Even when a construction has a semantic basis, and the lexical items entering into it exhibit some degree of semantic coherence (as in the English passive), the exact inventory is often conventionally determined and less than fully predictable. The membership of some classes (e.g., the class of verbs taking a particular irregular past-tense form) may be totally arbitrary.

Because the membership of certain classes cannot be predicted, it has to be specifically learned by speakers and explicitly described by linguists. This does not by itself establish the autonomy of grammar, except in the weakest sense (acknowledged by every linguist) that functional considerations fail to fully and uniquely determine every detail of language structure—the specific patterns and distributions of a language are shaped by convention and acquired through social interaction. Whether distributional restrictions support any stronger form of autonomy depends on what kind of apparatus is needed to describe them. There is in fact every reason to believe that only symbolic assemblies are necessary.

Complex expressions consist of symbolic assemblies, and the conventional patterns they instantiate consist of schematizations of such assemblies (recall Figures 5 and 6). Depending on the supporting data, the process of schematization can be carried to any degree, and to different degrees for different facets of a construction. This produces hierarchies of schematized assemblies, illustrated by our previous example *THING THING* → *CONTAINER lid* → *jar lid* (where *THING THING* represents a very general pattern for nominal compounds, and *CONTAINER lid* is the low-level pattern abstracted from forms like *jar lid*, *pot lid*, *box lid*, and *coffin lid*). In view of the many possible levels and dimensions of schematization, as well as the many kinds of similarity exhibited by overlapping sets of complex expressions, we can reasonably envisage the emergence of vast, intersecting networks of schemas representing patterns with varying degrees of generality and salience. The full characterization of what linguists might consider to be a unified construction—e.g., nominal compounding, passive voice, or past tense formation—requires a substantial network in which certain schemas are categorized as instantiations or as extensions vis-à-vis others

that are more abstract or more prototypical. Despite its complexity (which I believe to be both linguistically necessary and cognitively realistic), such a characterization does not imply a loss of generality: any valid generalization is captured by a schema at the appropriate level of abstraction.

These networks are the locus of distributional knowledge. Even in cases where a high-level schema presumably emerges (e.g., *THING THING*), a network of instantiating structures specifies which regions within the large space of possibilities it defines are in fact conventionally exploited. Among these structures, capturing local generalizations, are low-level schemas pertaining to narrowly defined classes of elements. The lowest-level structures in such a network are schemas incorporating specific lexical items as components (e.g., *CONTAINER lid*) and even actual expressions learned as units (*jar lid*). Symbolic assemblies that incorporate specific lexical items embody a speaker's knowledge of their distributional idiosyncrasies. Consider the English ditransitive construction, where a verb takes two post-verbal nominal complements:

- (15) She {gave/lent/bequeathed/*transferred} him a substantial amount of money.

Not every verb potentially occurring in this construction actually does so, and while various partial regularities are captured by a network of low-level schemas (Goldberg 1992, 1995), a certain amount of lexical specification is also necessary. It is provided by subschemas that mention particular verb stems.

For example, the information that *bequeath* occurs in this construction resides in a subschema which incorporates this specific verb but is schematic in regard to the nominal complements (there is no such schema for *transfer*). Similarly, the information that *break* follows a certain minor pattern in forming its past tense resides in knowledge of the specific form *broke*, which instantiates that pattern.

Since language is learned through usage, it ought not be surprising that the preponderance of linguistic knowledge consists of specific expressions and low-level patterns, many of which incorporate particular lexical items. This is not to deny the existence and importance of general, productive patterns represented by high-level schemas. I would however suggest that fully general patterns constitute a distinct minority, that lower-level structures provide critical information and do much if not most of the work in speaking and understanding.

Attempts to impose a strict boundary between structural regularity and idiosyncrasy—attributing them to distinct modules or processing systems (Chomsky 1965; Pinker and Prince 1991)—are, I believe, both linguistically untenable and psychologically dubious. Instead I envisage a dynamic, interactive process whereby structures at all levels of abstraction compete for activation and the privilege of being invoked in producing and understanding utterances (cf. Elman and McClelland 1984; Langacker 1988, 2000). Particular high-level schemas may be so entrenched and accessible (relative to alternative patterns or to subschemas) that they normally win the competition and prevail as general or default-case patterns.

But even in such circumstances, specific instantiating expressions can be learned and accessed as units if they occur with sufficient frequency (Stemberger and MacWhinney 1988). And in general, lower-level structures have a built-in competitive advantage, since their greater specificity enables them to match a potential target in many more respects, each contributing to their activation.

4. SUBJECT AND OBJECT

Though radical in relation to current dogma, cognitive grammar is not at all fanciful. It is highly conservative in what it assumes about cognition and what it allows the analyst to posit in describing a language. It has been successfully applied to myriad problems in diverse languages (see, for example, Achard 1993; Casad 1982; Cook 1988; Janda 1993; Maldonado 1992; Manney 2000; Rice 1987; Rubba 1993; Smith 1993; Tuggy 1988). Moreover, detailed accounts have been given of representative phenomena that have figured prominently in the theoretical literature and have often been cited in support of autonomous syntax. In particular, I would argue that the cognitive linguistic descriptions of English passives, “raising” constructions, and pronoun-antecedent relationships are more adequate and more revelatory than generative analyses (Langacker 1982, 1995b; van Hoek 1995, 1997). One basic problem for a symbolic account of grammar is to characterize the notions *subject* and *object*. There are few topics on which linguistic theorists exhibit such a striking lack of consensus. About the only thing virtually all of them agree on is that a conceptual definition valid for all subjects or all objects is just not feasible. I believe that such a characterization is indeed possible. It must however be suitably abstract, as well as psychologically plausible. As in the case of grammatical classes, we must seek a broadly applicable description at the level of general cognitive abilities initially manifested in the prototype. I propose that subject and object status ultimately reduces to a kind of focal prominence conferred on participants in a profiled relationship. In particular, subject and object nominals are identified as respectively specifying the *trajector* and the *landmark* of a profiled relationship. These latter notions have in turn been described in various ways (Langacker 1990: ch. 9, 1991: 7.3, 1997b). I have characterized a trajector as (i) the *primary figure* in a profiled relationship, (ii) the element one is *primarily* concerned with describing or locating (a clause-internal “topic”), and (iii) the *initial focus of attention* (“starting point”) in a chain representing the order in which elements are accessed in building up to a full conception of the profiled relation. The characterization of a landmark is obtained by replacing the words *primary*, *primarily*, and *initial* with *secondary*, *secondarily*, and *second* (i.e., changing “1” to “2”). I conceive of points (i)-(iii) as being complementary and mutually compatible. In referring to trajector and landmark as *primary* and *secondary focal participants*, I intend to subsume all three.

Stated more precisely, the proposal is as follows: a *subject* (or *object*), at a given level of organization, is a nominal element which elaborates the trajector (or landmark) of the relationship profiled at that level. A nominal element is one that profiles a thing, and it elaborates a trajector or landmark by virtue of its profile corresponding to it. Consider the sentence *Alice admires Bill*, whose semantic pole (ignoring tense) is sketched in Figure 7. *Admire(s)* profiles a relationship of mental experience (indicated by a dashed arrow). Its trajector is the experiencer, and its landmark is the target of experience. *Alice* and *Bill* are nominal expressions, for they profile “things”, whose semantic specifications are abbreviated as “A” and “B”. Following usual assumptions regarding constituency, *admires* and *Bill* combine, at one level of organization, to form the composite structure *admires Bill*. At a higher level of organization, *admires Bill* combines with *Alice* to give the overall composite structure *Alice admires Bill*. Observe that the same experiential process is profiled at three levels: by the verb *admire(s)*, by the “verb phrase” *admires Bill*, and by the full clause *Alice admires Bill*. Tracing along correspondence lines (both vertical and horizontal) reveals that

Alice elaborates the trajector of this process at all three levels, and *Bill* the landmark. Thus *Alice* is identified as the subject, and *Bill* the object, with respect to the verb, the verb phrase, and the clause. This proposal exemplifies the working strategy noted at the outset, namely to seek characterizations that are simultaneously (i) reasonable from the psychological standpoint, (ii) well motivated in purely semantic terms, and (iii) optimal as a basis for analyzing grammar. Let us first consider semantic motivation. I have already indicated that the trajector/landmark distinction is necessary just to describe the meanings of relational expressions. An adequate description has to capture the semantic contrast between pairs like *above* and *below* (also *before* vs. *after*, *in front of* vs. *in back of*, *precede* vs. *follow*, etc.), which have the same conceptual content and profile the same relationship (Figure 3). Constructs like trajector and landmark, pertaining to the salience and accessibility of the relational participants, would seem to offer the only possible basis for distinguishing them. The claim, then, is that a sentence like (16)(a) is primarily concerned with locating the alarm button, and evokes the light switch as a landmark for doing so, whereas (16)(b) shows the opposite alignment.

- (16) (a) The alarm button is just above the light switch.
 (b) The light switch is just below the alarm button.

Discourse considerations provide supporting evidence. Observe that only (16)(a) is natural in response to the question *Where is the alarm button?*, while (16)(b) responds to *Where is the light switch?*. This illustrates Chafe's discourse-based characterization of a subject as "a starting point to which other information is added" (1994: 92). The question *Where is X?* establishes X in the discourse as the obvious point of departure for the answer.

What about cognitive plausibility? We can start by noting that figure/ground organization is a well-established perceptual phenomenon and that the figure in a scene is the first element to catch our attention. Moreover, I presume there is nothing inherently implausible about supposing that figure/ground organization (or something directly analogous to it) is also prevalent at higher levels of conceptualization. The trajector/landmark asymmetry in relational expressions does in fact exhibit certain tendencies suggesting a strong affinity to figure/ground organization. Talmy (1978) has pointed out that factors contributing to the choice of perceptual figure—notably compactness and mobility—also tend to be associated with the elements I would identify as relational trajectors. For instance, (17)(a) is far more natural than (17)(b), given usual assumptions about the relative size and mobility of the participants.

- (17) (a) The bicycle is next to the church.
 (b) ?*The church is next to the bicycle.

There are of course many cases where opposite trajector/landmark alignments are both permitted, e.g., the active/passive alternation, as in (18), or lexical alternations like *above/below*, *in front of/in back of*, *before/after*, etc.

- (18) (a) Iraq invaded Kuwait.
 (b) Kuwait was invaded by Iraq.

Figure 7. A symbolic assembly illustrating the definition of subject and object.

Intuitively I regard these alternations as being quite comparable to the phenomenon of figure/ground reversal. Partial support for this comparison derives from the fact that in both cases there is usually a preference for one of the alternate alignments. In (14)(b), for example, it is easier to perceive groups of x's standing out as figure against a background of dashes than to do the opposite. Likewise, an active is unmarked relative to its corresponding passive, and forms like *above*, *in front of*, and *before* are the default members of their respective pairs. Furthermore, the neutral member of these oppositions is usually the one that confers trajector status on the entity which is most easily chosen as perceptual figure. As the terms themselves indicate, an “active”-clause subject tends to be more mobile and energetic than its “passive”-clause counterpart. Also, if X is *above* or *in front of* Y it is X that we are more likely to see, and if X comes *before* Y it is X that we will first encounter.

A variety of experimental findings are interpretable as lending plausibility to the proposed characterization of grammatical subjects. I hasten to add that the interpretation is in each case my own, and that the investigators were not specifically concerned with subjects per se. To show the relevance of this work, I need to say just a word about the broader theoretical context in which my proposal is situated (Langacker 1993b, 1997b, 2003). Myriad linguistic phenomena call out for description in terms of conceptualizations that are *dynamic* in the sense that the temporal axis—how they unfold through processing time—is critical to their value. They involve successive foci of attention, each occurring in a context evoked by its predecessor.

In a *focus chain* of this sort, directing attention to a given element results in the conceptualizer orienting to a new context within which the next focus can be detected. Equivalently, I will speak of a *reference point* providing mental access to a set of potential targets, which collectively constitute its *dominion*. The initial focus (or reference point) in such a chain can be called a *starting point*. We find clear examples of reference point chains in certain possessive and locative constructions:

- (19) (a) Tom's mother's cousin's friend's lover's psychiatrist
- (b) Your keys are downstairs, in the study, on the desk, under some papers.

In (19)(a), a focus chain leads from Tom, the starting point, to a particular psychiatrist, the ultimate target. Each possessor serves in turn as a reference point, in which capacity it evokes a dominion containing the possessed, which can then be put in focus as the next reference point. Similarly, the successive locatives in (19)(b) direct attention to smaller and smaller spatial areas, each of which contains the next and thus affords mental access to it.

It needs to be emphasized that the conceptualizations associated with most expressions are complex and multifaceted, so that no single ordering accounts for all their properties. There are numerous kinds of focus chains, which can co-exist without necessarily being co-aligned, each pertaining to a different level or dimension of linguistic organization. Besides possession and location, exemplified in (19), natural orderings are given by such factors as the temporal sequence of events, the transmission of force from participant to participant along a causal chain, and successive access to a series of minds, each conceiving of the next (e.g., *Fred believes Sally suspects Bob knows Martha likes him*). Along the axis of speech time, the words in a sentence constitute a focus chain which can correlate with any of the others and thereby heighten its salience. With respect to the tracking of referents in a discourse, salient nominals emerge as reference points, establishing structural dominions within which compatible pronouns are freely interpretable as being coreferential to them. A “topic” (at a given level of organization) is a reference point anchoring a realm of knowledge or experience (its dominion) into which one or a series of propositions is to be integrated.

In the context of this general scheme, it is reasonable to view the trajector/landmark asymmetry as a special kind of focus chain. Trajector and landmark would then be characterized as initial and second focus in a natural ordering pertaining to relational participants. Specifically, since the conception of a relationship presupposes the conception of its participants, we can describe a trajector (and landmark) as the first (and optionally the second) participant saliently evoked in building up to the full conceptualization of a profiled relation. If I conceive of a person, for example, I can use this as a starting point to anchor the more elaborate conception of a person engaging in some activity—such as motion, perception, or the exertion of force—which may well involve its interaction with a second focused participant. Verbs impose this kind of asymmetry as an inherent aspect of their lexical semantic value. At the lexical level (where events are categorized into conventionally recognized types), the more active participant is usually chosen as starting point. At higher levels of grammatical organization, where discourse considerations come into play, other options are available. For instance, the passive construction allows us to evoke a non-active participant as starting point, using it to anchor the more elaborate conception of an event in which it has a patient-like role.

Turning now to the experimental findings, MacWhinney (1977) presents a variety of evidence (from experimental tasks involving rating, elicited production, problem solving, verification, production, and recall) that “the speaker uses the first element in the English sentence as a starting point for the organization of the sentence as a whole”, where a starting point serves as basis for “the ACTIVE CONSTRUCTION OF AN ACTIVE PERSPECTIVE” (152). Similarly, Gernsbacher and Hargreaves (1992) explain numerous experimental results, notably pertaining to the “privilege” of initial elements, in terms of the “structure building framework”. They suggest that building coherent mental representations first involves “laying a foundation”, and that subsequent information which “coheres or relates to previous information is mapped onto the developing structure” (87). Moreover, recent experimental work points to agents being accessed more rapidly than patients: “...When a prototypical

causal relation can be perceived directly and when the participants in the event maintain their role for an extended time interval, agent information is accessed more rapidly than patient information. The prominence of the agent over the patient in grammatical phenomena is paralleled by a privileged status of the agent at the level of perceptual processing. It is tempting to speculate that the observation that the agent is a prototypical subject and that the subject in canonical sentences surfaces before the object, can be traced back to the fact that, during visual event perception, agent information is available earlier for further processing than patient information” (Verfaillie and Daems 1996: 144).

While these formulations do not refer specifically to grammatical subjects, they help render plausible the general type of characterization proposed. In most of the cases cited by MacWhinney and by Gernsbacher and Hargreaves, the initial element was in fact the subject. We can further note the cross-linguistic tendency for agents to be chosen as subjects, and for subjects to precede objects in basic word order. These studies strongly suggest that order of access is important in language processing, and that the conception evoked by a clause is actively constructed on the foundation provided by a starting point. In the overall scheme outlined above, a complex expression comprises numerous natural orderings pertaining to different levels and dimensions of organization.

Hence there ought to be some proclivity for their starting points to coincide, which we do in fact observe in canonical clauses like *He broke it*, where the initial word is also the subject, the agent, and the topic. By the same token, experimental findings indicating that agents are accessed quickly and that initial elements provide the starting point for structure building lend some credence to the characterization of subjects in such terms.

If the studies just described offer circumstantial evidence for the proposed characterization of subjects, some experimental results reported by Tomlin (1995) are perhaps the equivalent of a smoking gun (see also Forrest 1996). Tomlin’s basic hypothesis—fully compatible with my proposal—was that, at the time of utterance formulation, the speaker codes the referent currently in focal attention as the syntactic subject of the sentence.

He tested it by controlling the attention of experimental subjects as they observed a two-participant event, which they then encoded verbally with either an active or a passive sentence. The event consisted of one fish swallowing another, and attention was directed to one of the fish (by means of an arrow flashed on the screen) just 150 ms. prior to the swallowing—too brief an interval for attention to wander in between. Tomlin thus predicted that attention focused on the swallowing fish would lead to the production of an active sentence (e.g., *The red fish swallowed the blue fish*), while attention focused on the swallowee would lead to production of a passive (*The blue fish was swallowed by the red fish*). This proved to be the case nearly 100% of the time. Tomlin’s results are of course insufficient to conclusively establish the proposed characterization of subjects. They do not, for example, clearly distinguish between grammatical subject and initial clausal element. They do however enhance the plausibility of claiming that subjecthood is ultimately a matter of focal prominence, interpretable as order of access to relational participants. Pointing in the same direction are numerous grammatical considerations, some of which will now be briefly summarized.

An initial point is that the characterization is sufficiently abstract, hence flexible enough in application, to handle the full range of subjects and objects. Depending on what relationship is profiled, for example, the subject can occupy any position in a causal chain (cf. Fillmore 1968):

- | | | |
|------|--|------------------------|
| (20) | (a) She opened the door with this key. | [subject = agent] |
| | (b) This key opened the door. | [subject = instrument] |
| | (c) The door opened. | [subject = patient] |

The characterization accommodates the subject in passives, and various other “special” constructions, without requiring derivation from hypothetical underlying structures. It also accounts directly for a striking asymmetry: a landmark implies a trajector, but not conversely. In (20)(c), for example, the single participant has an object-like semantic role but is nonetheless realized as the grammatical subject. This is a consequence of the trajector and landmark being the *initial* and *second* focal elements: something can be second only if something else comes first. Note that this asymmetry pertains specifically to trajector/landmark alignment—“argument structure”—irrespective of whether the focal elements are actually spelled out by overt nominal expressions. For instance, an imperative like *Shut the door!* has both a trajector (understood as the addressee) and a landmark, even though only the latter is overtly realized. The proposed characterization of subject and object makes no reference to grammatical constituency, but rather to correspondences, profiling, and focal prominence: a nominal expression qualifies as a subject by virtue of its profile corresponding to the trajector of a profiled relationship, and as an object when its profile corresponds to the landmark. Although Figure 7 assumes the familiar S[VO] constituency for *Alice saw Bill*, the same grammatical relations are assigned with [SV]O constituency (where *Alice* first combines with *saw*, and *Bill* then elaborates the landmark of *Alice saw*), or even with a “flat” SVO structure. There are indeed constructions that manifest [SV] constituents:

- (21) (a) The lawyer [we hired] was incompetent.
 (b) [Jack sort of liked] but [Jill really detested] that movie we plan to see.

In cognitive grammar these can simply be assembled as [SV] constituents—there is no need to posit derivations from underlying structures with the canonical S[VO] arrangement. And of course, the well-known problem posed by languages with VSO word order does not even arise, since the characterization of objects does not depend on a [VO] constituent. The characterization of subject and object in terms of primary and secondary focal prominence is fully consonant with, if not responsible for, their high levels of grammatical activity. Though every construction has its own rationale, and other factors (including other sorts of prominence) come into play, it stands to reason that focal participants would tend to be recruited for purposes of agreement, clause linkage, antecedence, etc. Keenan and Comrie (1977) posited a universal hierarchy for access to relative clause formation that we can abbreviate as Subject > Object > Other, and most frameworks adopt this hierarchy for various reasons. On my account, the high accessibility of subjects and objects directly reflects their intrinsic nature. Particularly strong support comes from van Hoek’s analysis of pronoun-antecedent relationships (van Hoek 1995, 1997). She has achieved an impressively comprehensive and unified account in terms of reference-point organization, such that a nominal with sufficient salience establishes a dominion within which a suitable pronoun is freely interpretable as being coreferential to it. The hierarchy Subject > Object > Other proves quite important in this regard. As shown in (22), a subject can function as the antecedent of any other nominal element, but not conversely, and an object can serve as antecedent for any element other than the subject (elements in bold are to be construed as coreferential):

- (22) (a) Tom likes his mother.
 (b) *He likes Tom's mother.
 (c) Jenny put the kitten in its box.
 (d) *Jenny put it in the kitten's box.

The special, ranked ability of subject and object to serve as reference points in pronominal anaphora nicely corroborates their characterization as first and second foci on the reference-point chain defined in terms of access to relational participants. It needs to be emphasized that the focal prominence of subject and object is not *inherited from* the entities chosen for this status, but rather is *imposed on* them by the very fact of their being singled out in this way. Trajector/landmark alignment is an aspect of construal, inhering in how a situation is conceptualized, as opposed to being objectively given. While trajector status will naturally tend to be conferred on an entity that is salient for other reasons, such as an agent or a discourse topic, it is not fully predictable from such factors, nor reducible to them. From this perspective examples with so-called “dummy” subjects, as in (23), are not necessarily problematic.

- (23) (a) There are alligators in the moat.
 (b) It was obvious that the house had not been cleaned.

I do regard items like *there* and *it* as meaningful. They can be thought of as abstract “settings” or “presentational frames”, subjective counterparts of the deictic *there* and referential *it*. Instead of referring to a specific place or thing, they announce the subsequent introduction of a local or global circumstance. Now certainly an abstract presentational frame has no objective basis or intrinsic salience—it is not there beforehand to attract focal prominence, and its abstract nature ensures that it will not seem terribly salient even when invoked to bear it. I suggest, then, that such elements are coherently subsumed in the proposed analysis as a limiting case. Recall that primary focal prominence is being explicated in terms of *initial access* in conceptualizing a relationship. This is quite compatible with the description of *there* and *it* as referring to presentational frames announcing the subsequent introduction of a situation.

Observe next the privileged status of subjects in equational sentences, which specify the identity of nominal referents. Now identity per se would seem to be a symmetrical relationship. Objectively, the sentences in (24) describe the same situation.

- (24) (a) My father is the mayor
 (b) The mayor is my father.

Yet they contrast linguistically in just the way predicted by the characterization of subject as starting point, as the element one is primarily concerned with describing or locating. Hence (24)(a) would be the more natural response if I asked you to tell me about your father, and (24)(b) if I asked you to tell me about the mayor. The linguistic asymmetry is especially striking with plural generics:

- (25) (a) Wombats are marsupials.
 (b) *Marsupials are wombats.

I would analyze these as equational sentences which establish identity between sets of indefinite size comprising “arbitrary instances” of the wombat and marsupial categories (Langacker 1991: 2.2). Since the extension of wombats is included in the extension of marsupials, a set of wombats (even the maximal set) can always be equated with a set of marsupials, but not conversely. Thus (25)(a) will always be valid, for it initially focuses on a set of wombats and describes it as coinciding with a set of marsupials. But if we start with a set of marsupials, as in (25)(b), its coincidence with a set of wombats cannot be assumed.

Finally, I will mention that numerous grammatical phenomena point to a special affinity between subjects (and secondarily, objects) on the one hand, and possessors on the other. To take just one example, it is very common across languages for possessive constructions to be used in specifying the trajector, and often the landmark, of a nominalized verb. English makes liberal use of both options, e.g., *Booth's assassination (of Lincoln)*, *Lincoln's assassination (by Booth)*. This affinity is quite expected given my description of possessors as reference points affording mental access to the entities possessed (Langacker 1993b). A possessive relationship holds between two things, one accessible via the other, while a verbal trajector and landmark are points of access to the conception of a process. When a verb is nominalized (e.g., *assassinate* ---> *assassination*), the process it designates undergoes a conceptual reification and is thereby construed as an abstract thing. As a consequence, the reference-point relationship between a processual participant and the reified process becomes a relation between two things, which makes it susceptible to possessive encoding.

CONCLUSION

Cognitive grammar identifies meaning with conceptualization and emphasizes our capacity for construing the same situation in alternate ways. Once construal is properly recognized and accommodated, the meaningfulness of grammatical structure becomes apparent. Grammar is symbolic in nature, wholly reducible to assemblies of symbolic structures (form-meaning pairings). It consists of patterns for imposing and symbolizing particular ways of construing the more specific conceptual content provided by lexical items. But specificity is a matter of degree, and lexical items also impose construals. Despite the traditional dichotomy, lexicon and grammar form a continuous spectrum of symbolic assemblies distinguished primarily by their level of abstraction, hence the generality of the patterns they embody. Cognitive grammar treats them all in a unified manner and acknowledges the critical role of low-level schemas (often incorporating particular lexical items) representing generalizations of limited scope. By reducing lexicon, morphology, and syntax to a continuum of symbolic assemblies, the framework achieves a major conceptual unification. It is also highly restrictive, in that all structures ascribed to a linguistic system must either be directly encountered as parts of occurring expressions, or else capable of emerging from them through the basic processes of abstraction and categorization.

The descriptive and theoretical notions of cognitive grammar have been formulated primarily on the basis of linguistic considerations and justified by their efficacy in handling the subtle complexities of representative language data. While certain assumptions are indeed made about cognitive processing, and various psychological phenomena are invoked (e.g., figure/ground alignment, prototype categorization, grouping, focusing of attention), for the

most part these are either well established or virtually self-evident. Less straightforward (and certainly controversial) is the issue of whether the specific use made of them for the description of language structure is optimal and appropriate. I believe the internal coherence and descriptive achievements of the framework suggest a positive answer. At some point, however, other kinds of evidence have to be sought more systematically and on a larger scale than they have to date. To be sure, particular claims and ideas of cognitive grammar have been employed or tested in a number of acquisitional, clinical, computational, and experimental studies (e.g., Barsalou, Yeh, Luka, Olseth, Mix, and Wu 1993; Holmqvist 1993; Jurafsky 1996; Kellogg 1993, 1994, 1996; Ryder 1994; Sandra and Rice 1995; Tomasello 1992; Verfaillie and Daems 1996). Such research is steadily gaining prevalence and influence in all facets of linguistics. It is especially welcome in cognitive linguistics and cognitive grammar.

Chapter 71

CONCEPTUAL COMBINATION: MODELS, THEORIES AND CONTROVERSIES*

Bing Ran^{1,*} and P. Robert Duimering²

¹Pennsylvania State University at Harrisburg, Middletown, PA, US

²University of Waterloo, Waterloo, Canada

ABSTRACT

This paper provides a comprehensive and critical review of the major theories and models of conceptual combination, by highlighting agreements and controversies in the literature, and identifying future directions for research.

The review summarizes the basic arguments of ten major models and then presents an analytical framework to compare and contrast these models along four dimensions: (1) the causal role of schemata in the model, (2) the role of cognitive harmony or consistency in the model, (3) the pragmatic orientation in the model, and (4) the explanatory scope of the model. The review identifies areas of agreement and disagreement among the various models and theories and calls for a synthesis theory to address various theoretical weaknesses and empirical gaps in the current explanations.

Keywords: conceptual combination, schema, cognitive harmony, consistency, pragmatics

INTRODUCTION

Conceptual combination refers to the cognitive process by which people use two or more concepts to construct a new conceptual entity that a single concept is insufficient to describe. Researchers agree that the ability to combine concepts plays a fundamental role in diverse

cognitive processes such as learning, communication, language comprehension, the composition of thoughts, and the expansion and structuring of knowledge.

In the last thirty years, there has been a very strong interest in the cognitive mechanisms involved in combining concepts in cognitive psychology and related fields such as linguistics, artificial intelligence, and philosophy. Many models and theories of conceptual combination have been proposed, among which ten models are of particular significance: Fuzzy Set Theory (Zadeh 1965, 1976, 1982; Osherson and Smith 1981, 1982); Selective Modification Model (Smith and Osherson 1984; Smith, Osherson, Rips, and Keane 1988); Amalgam Theory (Thagard 1984); Concept Specialization Model (Cohen and Murphy 1984; Murphy 1988, 1990, 2002); Composite Prototype Model (Hampton 1987, 1988, 1989, 1990, 1991); Dual-Process Model (Wisniewski 1997a, 1997b, 1999; Wisniewski and Love 1998); Constraint Model (Costello and Keane 2000, 2001); Competition Among Relations in Nominals (CARIN) Model (Gagné 2000, 2001; Gagné and Shoben 1997); Coherence Theory (Thagard 1989, 1997); and Interactive Property Attribution Model (Estes and Glucksberg 2000; Choi, Oh, Yi, and Shin 2007). This paper will critically review these ten models by identifying areas of agreement and disagreement among them, and various theoretical weaknesses and empirical gaps in the current explanations that might be addressed by a future synthesis theory.

The paper is organized as follows. In the next section, each of the ten models will be briefly described and evaluated. Then an analytical framework will be proposed to summarize agreements and controversies among the models. Questionable assumptions and issues in the current theorizing will also be critically examined in the context of a discussion of future directions for conceptual combination research.

1. CURRENT MODELS OF CONCEPTUAL COMBINATION

In this section, we will briefly summarize ten significant models of conceptual combination. The ten models can be sorted into two groups. In the first group, each model was proposed as a logical extension or modification of previous models: Fuzzy Set Theory, Selective Modification Model, Concept Specialization Model, Dual-Process Model, and Interactive Property Attribution Model. Our review will trace the development of these models, focusing on how each addresses earlier theoretical weaknesses. In the second group, the remaining five models each focus on particular aspects of the conceptual combination process: Amalgam Theory, Coherence Theory, Composite Prototype Model, Constraint Model, and CARIN Model. Our review will examine the specific aspects that are emphasized by each model in this group.

1.1. Conceptual Combination as the Intersection of Fuzzy Sets

The earliest attempt to describe the phenomenon of conceptual combination was conducted by mathematicians known as fuzzy set theorists. This attempt generated a formalized explanation of how humans combine smaller conceptual units into more complex ones (Osherson and Smith 1981, 1982; Zadeh 1965, 1976, 1982). The model is based on the

idea of referential semantics in which the meaning of a concept represented by a word equates to the extensional set of things denoted by the word. For example, the meaning of the concept *bird* refers to the set of all birds. When two concepts are combined, the resulting concept is then the intersection of the two extensional sets. Thus, if X and Y are the extensional sets of concepts x and y respectively, the conceptual combination xy is understood as the intersection of the set X and the set Y , that is the set of things that are both X and Y . For example, the meaning of *pet fish* is the intersection of *pet* and *fish*, i.e., the set of things that are both *pet* and *fish*. More formally, in classic set theory, the conceptual combination XY is defined as follows: (Let X, Y be sets) the intersection of X and Y (denoted $X \cap Y$) is the set $\{Z: z \in X, z \in Y\}$. In fuzzy set theory, the intersection of two fuzzy sets A and B with respective membership functions $f_A(x)$ and $f_B(x)$ is a fuzzy set C , whose membership function is related to those of A and B by $f_C(x) = \text{Min} [f_A(x), f_B(x)]$, $x \in X$. (Zadeh 1965).

As a formal logic model of conceptual representation, fuzzy set theory provides a strong tool to describe and analyze conceptual combination. The description is clear, logical, and parsimonious. However, as a description of conceptual structure, fuzzy set theory was strongly criticized by psychologists. The major criticisms could be summarized as follows.

The first criticism relates to whether set theory is an appropriate theory of concept representation. For example, the applicability of set theory in concept representation is limited. Osherson and Smith pointed out that the extensional view of concepts “is best suited to “kind” notions (such as *dog*, *tree* and *animal*), artifact” notions (like *tool* and *clothing*), and to simple descriptive notions (like *triangular* and *red*) where the extensional sets are easier to define. More difficult to describe are intentional or intricate concepts such as *belief*, *desire*, and *justice*” (Osherson and Smith 1981: 38). The diversity of different kinds of concepts imposes difficulties on how set theory formally describes their structure, and whenever non-kind concepts are combined, the intersection of sets is difficult to describe or formalize. Based on this observation, Murphy argued that “(i)t is very difficult to interpret (set theory) as a psychological theory at all. Even if all *pet fish* fall into the intersection of *pets* and *fish*, this does not tell us what people do with their concepts *pet* and *fish* in order to create a new concept” (Murphy 1988: 531). To be considered a psychological model, set theory should provide an intensional explanation of how or why people combine concepts.

The second criticism relates to what are known as conjunction effects. Fuzzy set theory will lead to a contradiction in its calculation whenever an object is more prototypical of a conjunction set than of its constituent sets (Osherson and Smith 1981). For example, it can be shown empirically that a guppy is more prototypical of the conjunctive concept *pet fish* than it is of either *pet* or *fish*. That is, $C_{\text{pet fish}}(\text{guppy}) > C_{\text{pet}}(\text{guppy})$ or $C_{\text{fish}}(\text{guppy})$. However, the intersection of the fuzzy sets is defined as: $(\forall x \in F) (C_{\text{pet fish}}(\text{guppy})) = \min (C_{\text{pet}}(\text{guppy}), C_{\text{fish}}(\text{guppy}))$ which implies: $C_{\text{pet fish}}(\text{guppy}) < C_{\text{pet}}(\text{guppy})$ or $C_{\text{fish}}(\text{guppy})$. In other words, “it is possible, contrary to fuzzy-set theory, for the characteristicness of an instantiation of a conjunctive concept to be greater than either of the characteristicnesses of its constituent simple concepts” (Jones 1982: 284). This apparent contradiction suggests that set intersection is insufficient to describe the conceptual combination process.

The third criticism relates to concepts that are not intersective. For example, Murphy (1988) noted that set intersection does not account for the meaning of combinations like *apartment dog*, which does not correspond to the intersection of the sets *apartments* and *dogs*. Moreover, nonpredicating adjectives, when combined with nouns, do not produce meaningful intersections. “The interpretation of atomic engineer as someone who runs equipment to make

atomic energy is not the intersection of atomic things (whatever they are) and engineers. the intersection of the two sets does not define the combined concept” (Murphy 2002: 445).

A final criticism is related to the symmetric property of set intersection which contradicts our intuitive understanding of the meaning of many conceptual combinations. Set theory presumes that noun-noun combinations are symmetric (i.e., true conjunctives), because $X \cap Y$ is equal to $Y \cap X$. However, our intuitive understanding of the combination XY usually has very different meaning than its YX counterpart. For example, “a desk lamp is a kind of lamp, but a lamp desk is a kind of desk” (Murphy 2002: 445).

1.2. Selective Modification Model

The weaknesses of using fuzzy set theory to explain conceptual combination led to an alternative explanation: the selective modification model proposed by Smith, Osherson and colleagues (Smith and Osherson 1984; Smith, Osherson, Rips, and Keane 1988). This model consists of two arguments describing how concepts are mentally represented and how these mental representations are combined. The model assumes that concepts are represented by *Attribute-value* pairs.

For example, apple may be represented by *Color-red*, *Shape-round*, *Taste-sweet* etc. Each attribute is associated with a certain weight, or “diagnosticity,” which is an empirically-determined numerical value that indicates “how useful the attribute is in discriminating instances of the concept from instances of contrasting concepts” (Smith, Osherson, Rips, and Keane 1988: 487). Each value is also associated with a certain weight to indicate its relative salience. For instance, red might be more salient than round in the apple concept, as determined by “votes” for the value by experimental subjects. Despite different terminology, *attribute-value* pairs essentially correspond to slots (or dimensions) and features in a schematic concept representation (Rumelhart and Ortony 1977; Rumelhart 1980).

The model further proposes that the meaning of an adjective-noun combination results from a process of “adjective modification” in which, the adjective modifies the noun: “Each attribute in the adjective concept selects the corresponding attribute in the noun concept; then, for each selected attribute in the noun, there is an increase in the salience (or votes) of the value given in the adjective, as well as an increase in the diagnosticity of the attribute.

Consider shrivelled apple as an example. Presumably shrivelled contains attributes pertaining to shape and texture; accordingly, it would select these attributes in the apple prototype, boost their diagnosticities, and shift their votes away from round and smooth and toward irregular and bumpy” (Smith, Osherson, Rips, and Keane 1988: 492).

Selective modification is regarded as the first psychological model of conceptual combination. The main contribution of this model is that it highlighted important aspects of conceptual combination, including typicality effects (i.e., that the typicality of a combination is not a simple function of the typicality of component concepts) and the conjunction effect (i.e., when an item is well described by a conceptual combination, it is usually more typical of that concept than of the two components).

However, the model suffers from two major drawbacks. First, the scope of the model is limited to only one kind of conceptual combination, namely, predicating adjective-noun phrases such as *red apple* or *long vegetable*. The model does not explain other types of

combinations such as nonpredicating adjective-noun combinations like *atomic engineer* (Murphy 2002) or noun-noun combinations like *telephone television*.

Second, the process of conceptual combination described by this model is problematic. As discussed by Murphy: “The main problem with this theory that later writers have criticized is its assumptions about modification. Consider the way modification works for the concept *red apple*. The adjective *red* finds its match in the schema: There is a feature with the same name. That feature now gets all the votes, and its dimension gets a higher diagnosticity rating.

However, there are more complex cases that aren’t so easily accommodated. It has been argued that sometimes, the exact feature would not be present in the concept already, and yet people can figure out how to modify it. Indeed, there may not be an obvious dimension for the modifier to affect. Furthermore, sometimes more than one dimension is altered. Thus, the modification process itself has been argued to be much more complex than Smith et al. let on” (Murphy 2002: 449-450).

1.3. Concept Specialization Model

Murphy and Cohen proposed the concept specialization model to address weaknesses of the selective modification model (Cohen and Murphy 1984; Murphy 1988, 1990, 2002). Similar to the previous model, the concept specialization model assumes a schematic representation of concepts where nouns are represented as schemata with slots (dimensions) and fillers (values for each dimension). Based on this representation, “conceptual combination is a process in which a head noun concept (is) specialized by one or more of its slots being filled by the modifying concept” (Murphy 2002: 453). In this process, “knowledge is involved in choosing the best-fitting slot” (Murphy 2002: 453). For example, to understand the combination *apartment dog*, the modifier *apartment* is used to fill some slot in the head concept *dog*. What dimension or slot of *dog* is picked by the modifier *apartment*? Our background knowledge will guide us to choose the slot of *dog* that makes the most sense with *apartment* as the filler. In this case, *apartment* is classified as a type of Habitat and so fills the Habitat slot in the head concept *dog*. This provides the interpretation of “a dog that lives in an apartment”. Beyond this slot-filling process, the model proposes that further interpretation and elaboration occurs in which we use our background knowledge to expand our initial interpretation. This process seeks to make an interpretation more coherent and complete by retrieving information from our background world knowledge that is relevant to the interpretation. For example, people might elaborate that an apartment dog is cleaner, smaller and quieter than other dogs. This elaboration generates a rich conceptual combination with emergent features that were not part of the original concepts.

As an extension of the selective modification model, concept specialization can account for more complex combinations. As Murphy explained: “one way to relate these two models is to think of the feature weighting model (selective modification model) as a simpler version or subset of the specialization model. That is, the specialization model is very similar in the way it deals with simple features, but it adds another layer of conceptual operations – the elaboration based on world knowledge” (Murphy 1988: 535). However, later researchers noted two major issues in this model’s explanation.

First, the concept specialization model can account for limited types of interpretations (Costello and Keane 2000; Wisniewski and Gentner 1991). The model can only account for

conceptual combinations where the head and modifier concepts are linked by some kind of thematic relation, but ignores the possibility of property-based interpretation. Wisniewski and Markman (1993) used the example *robin hawk* to illustrate. *Robin hawk* could be interpreted as “a hawk that preys on robins”, by filling the Preys slot in the schema representation of *hawk* with the modifier name. The meaning generated this way explains the thematic relation between *hawk* and *robin*. However, it does not allow for properties of the modifier to be transferred into the head representation. This means that an interpretation such as “a hawk with a red breast” cannot be explained by this model.

Second, the process of concept specialization is worth further scrutiny. The model suggests that people attempt to place the modifier into the best fitting slot in the head noun’s schema. However, beyond a metaphorical description, the mechanisms involved in cognitively “filling a slot” are not specified in the model. Intuitively, it is not the whole modifier concept that fills the slot in the head concept. For example, the meaning of *apartment dog* does not result from the whole concept of *apartment* filling the Habitat slot of *dog*, but only certain aspects of *apartment*. The concept of *apartment* has its own rich and complex schematic structure, potentially including dimensions related to rent, size, storey, apartment number, landlord, etc. None of these dimensions would be relevant to the Habitat slot of the concept *dog*, but what happens to them in the slot filling process is not clear.

1.4. Dual-Process Model

Wisniewski (1997a, 1997b, 1998, 1999) proposed the dual-process model as a successor to address some of the weaknesses in the concept specialization model and to account for a wider range of empirical data. The model assumes that concepts are represented by a schematic structure, and proposes three general types of conceptual combination: property-based, relation-based, and hybrid interpretations. “Relation-linking interpretations involve a relation between the referents of the modifier and head concepts. For example, people sometimes interpret *robin snake* as “a snake that eats robins”. In property interpretations, people assert that one or more properties of the modifier concept apply in some way to the head concept, as in “snake with a red underbelly”, for *robin snake*. A third, less frequent type of interpretation is hybridization. These interpretations refer to a combination of the constituents (e.g., *a robin canary is „a bird that is a cross between the two – half robin and half canary”*) or to a conjunction of the constituents (e.g., *a musician painter could refer to someone who is both a musician and a painter*)” (Wisniewski 1997b: 168-169). The dual process model proposes that these different interpretations arise from two different cognitive processes: relational combinations result from integration (also known as scenario creation), while property-based combinations result from comparison and construction (hybridization may be considered as both).

In a process similar to Fillmore’s (1968, 1976, 1982) case and frame grammar, scenario creation generates a relation-based interpretation, “...creating a plausible scenario involving the constituents of the combination. ... For example, a plausible interpretation of *truck soap* is “*soap for cleaning a truck*”, because truck can be bound to the recipient role of cleaning (i.e., the thing being cleaned), while soap to the instrument role (*what is used to do the cleaning*)” (Wisniewski 1997b: 174).

Property-based interpretations start from comparing commonalities and differences between the head and modifier concepts along comparable dimensions, and selecting a property from the modifier to apply to the head. When multiple differences are found, several factors regulate the choice of the best property to be transferred to the head concept, including the communicative context, the salience of the property, cue and category validity, and plausibility. After comparison, the selected property is used to construct a new version of that property for the combined concept. “The new property must bear enough resemblance to its source in the modifier so that people can determine how the modifier contributes to the meaning of the combination... at the same time, the construction of the new property must not alter the head noun concept in such a way that it destroys its integrity” (Wisniewski 1997b: 176). For example, “in interpreting fork spoon, people could begin by aligning the handle of fork with the handle of spoon, and the end of fork with the end of spoon and note an important difference: forks have prongs on their ends but spoons have “little bowls” on their ends... the comparison process identifies where in the representation of spoon the property “has prong” can be incorporated (on the *end of spoon*). However, there is a conflict between mentally connecting this property to the *end of spoon* and staying within the referential *scope of spoon*... People can resolve this conflict by mentally attaching the prongs to the end of the little bowl and shortening them or by mentally attaching the prongs to the *top of the spoon*” (Wisniewski 1997b: 176-177).

The dual-process model extends the concept specialization model by providing an explanation of different types of interpretations, especially by accounting for processes involved in property-based conceptual combinations, and by synthesizing schema based theories of conceptual combination into one model. However, critics of the dual-process model have argued that it lacks a detailed explanation of the underlying cognitive mechanisms involved. For example, Costello and Keane (2006) noted that “the elaboration or construction process ... is clearly a very complex process that is, as yet, unspecified” (Costello and Keane 2006: 334). Similarly, Murphy (2002) pointed out that “what is not yet known is the online process by which one of these interpretations is constructed / selected. The feature-mapping process involves comparing the two concepts, identifying a feature of the modifier that could be plausibly transferred over to the head noun, and carrying out that transfer. The slot-filling process involves seeing whether there is a relation available in the head noun that the entire modifier could fill, and then constructing that relation. Furthermore, both of these are complicated by the possibility of construal (e.g., interpreting skunk as referring to a bad smell), which allows many more ways of possibly relating the concepts. How all these alternatives are considered (or if they aren't, how they are ruled out) is at this point not clear” (Murphy 2002: 458-459).

1.5. Interactive Property Attribution Model

The interactive property attribution model was proposed by Estes and Glucksberg (2000) as an extension of Wisniewski's dual process model. Specifically, this model provides an explanation of property-based interpretation by suggesting that it is not similarity between component concepts, but feature interactions between the head and modifier, that guide property-based interpretations. By assuming a schematic representation of component concepts, the model proposes that “the modifier and the head play different, but equally

important, roles: The head provides relevant dimensions, whereas the modifier provides candidate properties for attribution. For example, in the combination *shark lawyer*, the head concept lawyer provides relevant dimensions for attribution (e.g., TEMPERAMENT, COMPETENCE, COST, etc.), and the modifier shark provides salient candidate properties (e.g., “predatory,” “aggressive,” and “vicious”) that can be attributed. ... (I)n the interactive property attribution model ..., instead of exhaustively aligning the dimensions and comparing the features of the two concepts, people align the relevant dimensions of the head with salient properties of the modifier” (Estes and Glucksberg 2000: 29-30).

The interactive property attribution model made two important extensions beyond previous models. First, it proposes that the head and modifier do not need to exhaust their complete list of dimensions for comparison and alignment as suggested by dual-process model; instead, only certain dimensions of the head concept are activated which are relevant to salient properties of the modifier. The second extension is the observation that relevance and salience of dimensions and features are context-dependent, rather than context-independent as assumed by most previous models. That is to say, “a salient feature of a modifier may increase or even introduce the relevance of a dimension in the head concept, and vice versa. For instance, NUMBER OF LEGS is not a particularly relevant dimension of *table*, since almost all tables have four legs. However, that dimension becomes relevant in the combination *octopus table*, when interpreted as a table with eight legs” (Estes and Glucksberg 2000: 30).

The preceding five models of conceptual combination have been reviewed chronologically according to their first appearance in the literature, because each can be regarded as an extension or replacement of previous models, which addresses prior limitations and offers increasing explanatory power. The remaining five models to be reviewed were proposed over a similar time-frame, and emphasized particular aspects of the conceptual combination process, but were not proposed as explicit extensions of previous models.

1.6. Amalgam Theory

Thagard (1984) proposed a theory of conceptual combination within the context of philosophical investigations on the phenomenon of scientific concept development. It is “a theory of how new concepts can arise, not by abstraction from experience or by definition, but by conceptual combination. Such combination produces a new concept as a non-linear, non-definitional amalgam of existing concepts” (Thagard 1984: 3). The basic claim of amalgam theory is that “conceptual combination requires mechanisms for reconciling the conflicting expectations contained in the candidate concepts” (Thagard 1984: 4).

Using formalized language, this theory assumes a schematic representation of concepts (the paper adopted the term “frame” from Minsky 1975) with slots and values (i.e., each concept has slots C_i with values $C_{i,1} \dots C_{i,n}$), and proposes that a new concept C_3 is formed from initial concepts C_1 and C_2 by selecting from $C_{1,j}$ and $C_{2,k}$, a subset of slots $C_{3,m}$ for combined concept C_3 . Thagard proposed six procedural rules to regulate the process of slots and value selection. For example, “a concept concerning a kind of physical object which has a value for size is also likely to have a value for weight. Conceptual combination should preserve such linkages” (Thagard 1984: 7).

Other rules propose that if a slot is chosen by conceptual combination, the value of the slot will depend on the adjectival concept, the variability of the concept, specific examples of the combination, or the representativeness of given instances of the combination. Specifically, the theory proposed that when we try to reconcile conflicting slots, we tend to favor those that contribute to desired problem solutions.

For example, “suppose that in forming the combined concept of a Canadian violinist you notice that your friend the Canadian violinist prefers hamburgers to classical French cuisine. In order to explain this preference, you may add the default expectation about Canadians to your frame for Canadian violinist, overruling the expectation derived from the frame for violinists” (Thagard 1984: 9). To reconcile the conflicting preference of food by Canadian violinist, we favor the connotation that “Canadians usually prefer hamburgers” to resolve the conflict that was brought in by *Canadian* and *violinist* (who supposedly prefer classical French cuisine).

Amalgam theory was the first model to suggest that conceptual combination is a kind of problem solving process of reconciling conflicting expectations contained in the candidate concepts. This general line of thinking is consistent with Thagard’s (1997) later theorizing of coherence on this problem (to be discussed below). The six procedural rules specify how features of the candidate concepts and empirically observed instances are reconciled into a non-conflicting set for the new, combined concept. However, how these rules might be implemented cognitively is not specified by the theory.

Further, the theory emphasizes the importance of specific examples in resolving the conflicting expectations contained in our component concept schema. For example, four of the six rules are example-driven procedures, in which empirical observations influence the meaning of a combination. However, some conceptual combinations do not have ready-made examples, especially novel combinations such as *triangular basketball* or *tasty computer*. How conflicting expectations are reconciled for such novel combinations needs more theoretical exploration.

1.7. Composite Prototype Model

Hampton proposed the composite prototype model (Hampton 1987, 1988, 1989, 1990, 1991) at about the same time as Murphy proposed the concept specialization model. The model assumes that concepts are represented schematically as sets of attributes connected by theory-driven relations. For example, we might know that birds have wings and can fly (attributes) and that having wings is an enabling condition for flight. Attributes are assumed to have a quantitative “degree of definingness” called Importance, which parallels with definingness (Smith, Shoben, and Rips 1974), cue validity (Murphy 1982), diagnosticity (Smith and Osherson 1984), or centrality (Barsalou and Billman 1989). It reflects the relative likelihood of an item belonging to a category given that it does or does not have the particular attribute. “At the top end of the scale of attribute importance there may be some attributes which are so important as to be necessary for category membership. For example HAS GILLS may be treated as a necessary attribute of FISH” (Hampton 1991: 106).

Based on these assumptions, Hampton proposed that “a conjunctive concept is then represented semantically by a composite prototype... which is formed as the union of the sets of attributes from both „parent” (constituent) concepts. Thus initially the concept PET FISH

will have all the attributes of both PET and FISH prototypes” (Hampton 1991: 107). The combined set of attributes is then modified based on a necessity constraint, which specifies that a necessary attribute of one constituent concept will also be a necessary attribute for the conjunctive. For example, if “has gills” is necessary for fish, then it will also be necessary for pet fish. For non-necessary attributes, their importance is determined as a monotonic positive function of importance for each constituent concept and attributes with low average importance will be dropped from the conjunctive set.

After forming the set of attributes for a conceptual combination, a consistency checking procedure is applied, and “(w)here there are incompatible attributes, a choice has to be made to delete certain attributes” (Hampton 1991: 107). The consistency constraint incorporates several rules. When a non-necessary attribute of a constituent concept has a conflict with the necessary attribute of the other constituent concept, it will not be used by the conjunctive. “For example, if PETS typically breathe air, but this is inconsistent with living underwater, which itself is necessary for the concept FISH, then breathing air will not be possible for PET FISH” (Hampton 1991: 108). When the conflict is between two necessary attributes of two constituents, then the conjunction is an empty set - a “logical impossibility” (Hampton 1991: 108). “When the conflict involves two non-necessary attributes, then the choice of which to delete will depend on their relative importance, on the overall consistency that can be achieved with respect to the other inherited attributes, and on the context in which the phrase is being used” (Hampton 1991: 108).

The composite prototype model contributes by proposing the necessity and consistency constraints, which exhibit a strong pragmatic orientation. This model is applicable to both novel and mundane combinations. As Hampton explained, “the proposed model could be applied to the conjunction of well-defined concepts with a core of common element defining features, with the desired results. The necessity constraint would ensure that all defining features of each concept remain critical for the conjunctive concept, and the consistency constraint would ensure the correct identification of nonoverlapping sets. Well-defined concepts would therefore require no different treatment in the model” (Hampton 1991: 108).

It is notable that this model bears some similarity to fuzzy set theory, in that the union of the attribute sets of constituent concepts corresponds closely with the intersection of the extensional sets denoted by each constituent concept. Hampton’s model can, therefore, be viewed as a kind of extension of fuzzy set theory by suggesting cognitive processes involved in the intersection of extensional sets. It also bears similarity to later Wisniewski’s hybridization interpretation whereby the meaning of a conceptual combination is taken to be a hybrid of the constituent concepts.

1.8. Constraint Model

The constraint model was proposed by artificial intelligence scholars Costello and Keane (1997a, 1997b, 1998, 2000, 2001). This model focuses on the efficiency of the conceptual combination process based on pragmatic principles, which have been implemented as a computational model called C3. The following will focus on the theoretical model and ignore technical details associated with its computational implementation.

Similar to other models, the constraint model assumes that concepts are represented in a schematic structure. When people understand a novel combination, they construct a combined

concept to represent that combination. In the process of combining, people assume that everyone involved in the communication follows the cooperative principle as theorized by Grice (1975). “Three constraints ... follow from this assumption. By following these constraints the listener can construct the correct concept as intended by the speaker” (Costello 2004). The first constraint is called plausibility. Because it is assumed that everyone in the communication is cooperating, the intended combined concept should be something the listener already somewhat knows. Thus the listener assumes that the new combined concept must describe something plausible which is similar to things the listener has seen before. The second constraint is called diagnosticity.

Because the speaker is assumed to be cooperating, the intended combined concept is one best identified by the two words in the phrase (otherwise the speaker would have selected other words). Thus the listener knows that the new combined concept must contain some properties which are best identified by (that is, are diagnostic of) each word in the phrase. The third constraint is called informativeness.

Because the speaker is cooperating, the intended combination is one for which both words in the phrase are necessary (otherwise the speaker would have used fewer words). Thus the new combined concept must be more informative than either of the constituent words. Costello illustrated his idea with the example of *shovel bird* understood as “a bird that has a flat, wide beak like a shovel, for digging worms” (Costello 2004). In this case, the listener constructs an understanding with the diagnostic properties of shovel (flat, wide, and used for digging) that is something plausible (bird digging worms) and informative (flat, wide beak).

The constraint model contributes by emphasizing pragmatic principles and addressing the possibility of multiple interpretations for novel combinations and how different interpretations are selected. For this reason Costello (2004) describes the model as a pragmatics of conceptual combination. Theoretically, however, it is notable that Grice discussed cooperation in communication in relation to four cooperative principles (quality, quantity, relevance, and manner), to explain how listeners could arrive at a speaker’s meaning and why speakers could mean more than they said. Grice argued that it is a violation of the cooperative principles that produces extra meaning not contained in what is said.

Although the constraint model borrows the general idea of cooperation, the proposed plausibility, diagnosticity, and informativeness constraints do not correspond directly to Grice’s four cooperative principles. Thus, whereas many communicative and pragmatic constraints may influence human cognition, why these particular three are emphasized by Costello and Keane is not clear.

1.9. Coherence Theory

Thagard (1997) proposed a coherence theory of conceptual combination following the basic line of thinking in his 1984 paper that conceptual combination involves solving a problem by reconciling conflicting expectations contained in the candidate concepts. The basic argument of coherence theory is that elements in a conceptual system (concepts, propositions, parts of images, goals, actions etc.) can cohere (i.e., fit together) or incohere (i.e., resist fitting together as described in Thagard 1989, 1997, 1998). If two elements cohere, there is a positive constraint between them. Otherwise, there is a negative constraint between them. “A positive constraint between two elements can be satisfied either by accepting both

of the elements or by rejecting both of the elements. A negative constraint between two elements can be satisfied only by accepting one element and rejecting the other. The coherence problem consists of dividing a set of elements into accepted and rejected sets in a way that satisfies the most constraints” (Thagard and Verbeurgt 1998: 2-3). Conceptual combination is therefore viewed as an “instance of coherence conceived of as maximization of constraint satisfaction” which “requires us to apply some concepts to a situation and withhold other concepts in such a way as to maximize the overall satisfaction of the constraints determined by the positive and negative associations between the concepts” (Thagard 1997). In practice, Thagard models such problems by constructing a constraint network with elements of all possible inferences of the head and modifier concepts. He then uses certain connectionist algorithms to propagate association weights in a way that maximizes coherence by accepting some elements and rejecting others. The output is “an interpretation of the relation between the head and modifier, as well as a collection of inferences about the object denoted by the head as characterized by the modifier. If the most coherent interpretation is nevertheless not very coherent, then move to other mechanisms such as analogy and explanation that produce incoherence-driven conceptual combinations” (Thagard 1997). Thagard (1997) used racial stereotypes associated with the conceptual combination *well-dressed black* to illustrate. He suggested that people confronted with this combination might activate a network of associated concepts such as *aggressive* or *poor ghetto inhabitant* for *black*; and *businessman*, not poor and not aggressive for *well-dressed*. The positive constraints in this network include the associations that ghetto blacks are aggressive, while negative constraints include the negative association that ghetto blacks tend not to be businessmen. Apparently, this is not a coherent network. To understand the meaning of this combination, we need to come up with the most coherent interpretation, which best satisfies the constraints. A connectionist algorithm is used to maximize coherence by rejecting *aggressiveness*, resulting in the interpretation of *well-dressed black* as “a black businessman who is not an aggressive ghetto black”.

Different from his earlier amalgam theory, Thagard’s coherence theory does not depend on schematic concept representation and uses connectionist logic to achieve coherence rather than a system of logical rules. Perhaps the most important contribution of this theory to the field of conceptual combination is the explicit orientation toward coherence and consistency in a cognitive network. The basic assumption is that a conceptual network tends to evolve toward a more stable and harmonious state through “the maximal satisfaction of multiple positive and negative constraints that is achieved by some parallel constraint satisfaction algorithms” (Thagard and Verbeurgt 1998: 1).

As such, coherence theory exhibits a basic assumption of goodness-of-fit or harmony as emphasized by Gestalt psychology. However, as explained by Thagard (1997), the current coherence-driven constraint-satisfying model has difficulties explaining non-predicting combinations such as apartment dog and incoherence-driven novel combinations like web potato where meaning may be motivated not by coherence but by the failure to find coherence. Finally, the connectionist algorithms used in coherence theory are not a direct reflection of mental activity, but a simulated approximation of the mind.

1.10. CARIN Model

The Competition Among Relations In Nominals (CARIN) theory (Gagné 2000, 2001; Gagné and Shoben 1997, 2002) provides a model of conceptual combination that uses our prior experience of the kinds of thematic relations that words have in compounds to predict what interpretations people will produce, and what compounds people will find easiest to understand. In linguistics, thematic relations between two words in a compound have often been examined by developing taxonomies of relations required for interpreting combinations (Kay and Zimmer 1976; Gleitman and Gleitman 1970; Downing 1977; Levi 1978). For example, Levi (1978) identified 15 thematic relations (such as Cause, Has, Make, For, Is, Use, About, etc.) to classify the meanings of many familiar compounds.

Unlike models which use a feature based schematic representation of concepts, the CARIN model assumes a kind of schematic representation of the relations between concepts. That is to say, it assumes a slot-type structure where slots are not features of the concept but are the kinds of thematic relations it can have with other concepts. The internal feature representation of concepts is largely irrelevant in this model, where the goal of conceptual combination is to fit compounds into existing relational templates. Specifically, the model argues that people possess distributional knowledge based on their experience of how often particular relations are used with particular concepts, corresponding with variable relation strengths for concepts. These relations “compete for the interpretation of the combined concept and ... the difficulty of interpretation is a function of the relative strength of the selected relation. ... Interpretations are easier if the required relation is of high strength than if the thematic relation is of low strength. Other things being equal, it is easier to arrive at the correct interpretation for *mountain stream* than it is for *mountain magazine* because the Locative relation has a greater strength relation than does the About relation” (Gagné and Shoben 1997: 81). Thus combinations involving typical thematic relations will be easier to understand than those involving atypical relations.

The CARIN model proposes a linguistic taxonomy of 16 thematic relations between component words, including Cause, Has, Make, For, Is, Use, Located, etc. By paying attention to the kinds of thematic relations that words assume and adding weights to these relations, the model predicts the priority between different thematic relations when constructing an interpretation for a compound. The model differentiates between the roles of the head and modifier concepts and, unlike other models which primarily emphasize the head concept, CARIN places most emphasis on the modifier by suggesting that it selects a thematic relation for the compound during the combination process. It is easy to conclude, however, that the 16 relations proposed in the model are too abstract to capture the variety of meaningful interpretations that can arise in conceptual combinations. For example, the combinations *birthday cake* and *bravery medal* share the For relation between their components. However, treating these as the same relation overlooks crucial differences between the interpretations of For in these two combinations: a *birthday cake* is a cake used for the purpose of celebrating birthday while a *bravery medal* is a medal rewarded because of bravery. The relations denoted by simple words such as Make or For imply very complex meanings corresponding to complex conceptual structures. Using this complex conceptual structure to link two concepts will inevitably result in a rather vague interpretation. In general, each of the 16 proposed relations is itself a category of diverse relational meanings, which lacks the precision to account for particular interpretations of conceptual combinations.

2. AGREEMENTS AND CONTROVERSIES AN ANALYTICAL FRAMEWORK

The preceding review demonstrates that conceptual combination research has produced a variety of theories with different emphases and terminology. As such it is impossible to compare and contrast every aspect of the literature in this paper. However, we will use a relatively coherent analytical framework to summarize the major issues related to conceptual combination and to provide a basis on which to compare and contrast the models and theories in an integrative way. The framework consists of four dimensions reflecting major characteristics of the various models: (1) the causal role of schemata in the model, (2) the role of cognitive harmony or consistency in the model, (3) the pragmatic orientation of the model, and (4) the explanatory scope of the model. In addition to using the framework to summarize major characteristics of the models, we will also provide a critical analysis and challenge some of the fundamental assumptions related to these four dimensions. Table 1 summarizes major characteristics of the ten models in relation to our framework.

2.1. The Causal Role of Schemata

Perhaps the most prominent aspect of the conceptual combination literature is that most models rely on schema theory in two ways. First, most models assume a schematic representation of conceptual structure. Except fuzzy set theory and coherence theory, all of the current models assume a schematic representation of noun concepts as dimension-value pairs. Although the CARIN model emphasizes thematic relations between the two constituent concepts, if thematic relations are understood as a kind of dimension reflecting how concepts connect with one another, then there is not too much difference between feature-based schema models and CARIN model. Second, schemata play a causal role in the cognitive mechanisms proposed by many of the models, where conceptual combination is understood in terms of certain cognitive operations that take place along dimensions in the schema. For example, the selective modification, concept specialization, dual process, CARIN, and interactive property attribution models all propose cognitive processes related to the idea of slot-filling, where a modifier, or some aspect of a modifier, fills a slot in the head concept schema. Schemata play a different causal role in the composite prototype model, which proposed mechanisms of composing a schema to represent the conceptual combination from the union of the prototypical attributes of both component concepts, based on necessity, importance, and consistency constraints. Only the constraint model did not specify a causal role of schema in the operation of its three proposed constraint mechanisms (plausibility, diagnosticity, and informativeness), despite of assuming a schematic concept representation.

Several questions could be raised about the nature of schemata in current theories of conceptual combination and the workings of associated cognitive processes such as slot filling. The causal role of schemata in current theories of conceptual combination is based on several problematic assumptions: 1. Schema represents our fundamental conceptual structure, independent of communicative context, 2. Pre-existing schema dimensions and values are necessary, sufficient, and exhaustive for cognitive processing, 3. The weights associated with

a schema's dimensions and values are absolute and will carry over to any cognitive processing task. There are issues related to each of these assumptions.

The first assumption, that schema represents our fundamental conceptual structure, deals with the nature of schema as either intrinsic to our cognition or retrospectively imposed. Schema theory describes "how knowledge is represented and about how that representation facilitates the use of the knowledge in particular ways" (Rumelhart 1980: 34). Schema theory assumes a logical structure to organize knowledge in human mind, in which features are organized at a lower conceptual level relative to the super-ordinate dimensions. This structure seems to match our intuitive experience: when we think about a concept, we may feel that it is logically related to other concepts in a manner similar to the dimensions or values proposed by schema theory. For example, we may know that *apples* are typically *red* and that red is a color, so the concepts *apple*, *red*, and *color* have a logical relationship that could be described by an apple schema consisting of a dimension/slot *color* with a value red.

However, the fact that we understand these concepts as being logically related to one another does not necessarily imply that our minds represent them in such an organized manner in permanent memory. It is quite possible that our minds represent knowledge in less structured ways and that logical structure is imposed after the fact, as part of online processes of thinking about these concepts and the logical relations between them. Hierarchical concept taxonomies serve situation-specific purposes or goals, suggesting that they may be created or activated online in response to a communicative context, rather than permanently stored in memory. *Red* might be a subordinate concept within an apple schema if we are selecting fruit at the supermarket, but apples might be subordinate to red if we are classifying objects based on color, and red might be irrelevant to apple if we are thinking metaphorically about New York City (the big apple).

The second assumption that a schema's pre-existing set of dimensions and values are necessary, sufficient, and exhaustive for cognitive processing is quite problematic. The fact that we can quite easily make sense of novel combinations counters such a view.

For example, the novel combination *smart apple* has the same structure as the more mundane *red apple*, but it is hard to imagine that our schematic knowledge of apple would include an intrinsic dimension/slot for *intelligence* with different values in smartness.

How many dimensions are needed to account for all of the possible knowledge that we have regarding a concept and for all potential conceptual combinations? How would we know whether a limited number of dimensions such as *color*, *shape*, *texture*, etc. would be capable of representing our complete knowledge of the concept *apple*? What about social concepts such as country and suicide, or abstract concepts like *love* and *hate*? How should we determine a necessary, sufficient, and exhaustive set of slots/dimensions for these kinds of concepts? Apparently, certain extra dimensions or associations must be activated and constructed online in the process of conceptual combination, rather than being stored in memory independent of context.

By the same token, many schema dimensions may be eliminated or filtered out efficiently in the process of conceptual combination. It was observed earlier that the specific cognitive mechanisms involved in filling a slot are not specified by any of the current models of conceptual combination. The example of *apartment dog* was used to illustrate that the modifier concept *apartment* is at least as complex in structure as the head concept *dog*, including potential dimensions related to rent, size, storey, apartment number, landlord, etc., yet most of these are irrelevant to the meaning of this combination. Thus, if *apartment* fills a

habitat slot in *dog*, is it the entire complex modifier concept that fills the slot? Or is much of this conceptual structure filtered out during the combination process, and if so, how does this filtering process work?

In general, most current models place primary emphasis on the structure of the head noun schema and overlook both the potential complexity of the modifier's schema structure and theoretical difficulties associated with the slot filling process.

The third assumption, that the weights associated with dimensions and values in a schema are absolute and will carry over to any cognitive processing task, deals with the way that the importance, saliency and diagnosticity of an attribute are evaluated in various models of conceptual combination. In some of the models, the importance or diagnosticity of an attribute are evaluated within the concept itself and treated as an absolute value to carry over to the combination. Thus, if certain attributes are most central for category membership, they will be assigned a higher weight which will be carried over to the combination.

However, when combining concepts, the importance of an attribute is not just related to individual concepts alone. The weight of an attribute seems to vary in relation to the context in which the concept is used. In other words, diagnostic and important features of a concept depend on the set of other concepts that are salient at the time of use and should not be evaluated just within a single concept. For example, when the meaning of the novel combination *chocolate computer* is understood as "a chocolate shaped like a computer", most of the attributes of computer are dropped regardless of how important they might be for the individual concept, and the importance of the dimension shape increases from a low weight to the much higher value for this combination.

Based on this analysis of assumptions underlying schema-based models, we would argue that a schematic representation of conceptual structure is insufficient to account for the complexity of conceptual combination. Pre-existing schema dimensions and values cannot provide a necessary, sufficient, and exhaustive set of knowledge resources appropriate to the required cognitive processing.

A different model of how conceptual information is stored and processed in the mind is needed to address the preceding limitations. In this respect, Thagard's coherence theory may suggest a potential alternative in that its proposed cognitive mechanisms do not depend on a priori schematic conceptual structure. Instead of an overly restrictive schematic representation, a connectionist framework requires only that networks of associated concepts are activated online during cognitive processing.

2.2. The Role of Cognitive Harmony or Consistency

The second dimension of our analytical framework considers the role of cognitive harmony or consistency in conceptual combination. When we combine two previously unrelated concepts, there are always conflicting or inconsistent connotations, expectations, and attributes contained in the component concepts that need to be reconciled before a coherent understanding can be generated. For example, in the combination *television cellphone*, the first concept *television* might bring in such attributes as large screen and a remote control, which would conflict with attributes of the second concept *cellphone* such as small screen and no remote control respectively. Thus the final meaning of the combination *television cellphone* needs to reconcile these conflicts. Three conceptual combination models

(amalgam theory, coherence theory, and composite prototype model) propose explicit consistency checking mechanisms for combining concepts with conflicting expectations to generate a meaning that is coherent, consistent and harmonious. Amalgam theory proposes six procedural mechanisms by which features from candidate concepts and instances are reconciled into a non-conflicting set for the new, combined concept. The composite prototype model proposes mechanisms that focus on how necessary attributes of head and modifier influence the meaning of the combined concept. Coherence theory proposes parallel weight propagation among elements in a conceptual network to maximize coherence. Two other models (the concept specialization and dual-process models) discuss the issue of consistency implicitly by suggesting that world knowledge is used to construe or clean up conflicts in the combined concepts.

Consistency is discussed intuitively without an explicit operationalization in most of these models with an exception of Hampton's model where he proposed a way to empirically estimate attribute coherence scores as part of the composite prototype model. For example, "the PET and BIRD attributes were set up as rows and columns of a two- way matrix, and ... subjects ... were instructed to take each row attribute in turn and to rate it against each column attribute using a scale from +2 meaning "can occur together", to -2 meaning "impossible to occur together" ... For each attribute, an average coherence score was calculated, based on the mean ratings given to the attribute, averaged across subjects and across the attributes of the other concept" (Hampton 1987: 66). This is a useful contribution in that it provides a way to measure the degree of consistency empirically, rather than relying on an intuitive notion of consistency.

Consistency and harmony issues are usually approached from the connectionism and consistency perspectives in cognitive psychology. Connectionism began in the field of artificial intelligence with the goal of understanding cognition by viewing the brain as a network of interconnected neurons (Rumelhart, Hinton, and Williams 1986). Connectionist models consist of interconnected and distributed processing units that perform simple computations concurrently transforming inputs into outputs to neighboring units. Thagard's coherence theory follows this connectionist tradition in terms of the basic assumptions of goodness-of-fit or harmony. The idea of harmony in connectionist approaches is also very similar to what has been historically called cognitive balance or consistency in the psychology literature. Consistency theories began in 1940s and include a group of theories that were proposed in attempts to "uncover the structural-dynamic characteristics of human cognition" (Simon and Holyoak 2002: 283) towards consistency. "These conceptions, symmetry, consonance, balance, and simplicity, are, of course, implied in that idea with which Gestalt theory started and which always was central to it, namely, the idea of a "good" figure... this model implies a number of different entities with certain properties and standing in certain relations, which make up a constellation of factors tending toward a standard (consistent) state" (Heider 1960: 168).

These theories generally assume that inter-related cognitive elements tend to form a stable structure, whereas inconsistent elements are associated with psychological tension that will lead to a tendency towards reestablishing stability or harmony. Conceptual combination could be understood as forming a stable structure of attributes associated with two component concepts, such that conflicting attributes associated with each concept are reconciled. Particularly in the case of novel combinations, perceived inconsistency among attributes may be associated with tension and psychological forces to reorganize the cognitive elements into

a more balanced or harmonious state. For example, we might interpret *elephant fish* as “a fish with a trunk”, but nonetheless will experience some residual psychological inconsistency or discomfort in relation to this constructed meaning. The remaining inconsistency comes from perceived conflict between this constructed interpretation and a larger cognitive field associated with our background knowledge of concepts associated with *elephant* and *fish*. In this circumstance, it is likely that further cognitive effort beyond the initial interpretation will be exerted to make the larger field harmonious. What cognitive mechanisms are involved in reducing discomfort and making the system of attributes coherent and harmonious? How do we empirically examine the state of harmony before and after a combination? How could the tradition from consistency theories and connectionist models be carried over to the research of conceptual combinations so that we do not re-invent wheels when proposing explanations? Future models of conceptual combination should address these questions.

2.3. The Pragmatic Orientation

The third dimension in our framework considers the pragmatic orientation of conceptual combination models. Studying how people construct and understand a conceptual combination is largely the study of how meaning is constructed and communicated in the context of a two-word combination. There are two senses of meaning in this situation: the semantic meaning (the literal meaning or the informative intent of an expression) and the pragmatic meaning (the implied meaning or the communicative intent of the expression). All ten models made attempt to explain semantic meaning of conceptual combination, but only five (amalgam theory, concept specialization model, dual process model, constraints theory, and interactive property attribution model) consider pragmatic meaning in their explanation of conceptual combination, where communicators might cooperate to achieve intended meaning, use context and general knowledge to construct the meaning of the combination, or make sense of the combination in terms of judging the plausibility, intention, goal, and appropriateness of the combined concepts. However, the degree of emphasis and the focus on pragmatic principles varies greatly between these five models.

For example, amalgam theory proposed that there are three kinds of conceptual combinations, pure, data-driven, and goal-directed, based on the degree that context is involved. A context could consist of prospective instances of the new combined concepts, or of a goal of solving a problem by reconciling the conflicting expectations contained in the candidate concepts. The interactive property attribution model discusses only the linguistic context of the combination, involving the collocation and pairing of words in the combination, rather than a broader communicative context that might contribute to the construction of a plausible and appropriate meaning. The concept specialization model does not consider how context or communicative intent contribute to meaning, but relies heavily on the concept of “background knowledge” to explain the plausibility and appropriateness of the meaning of combinations. As a direct descendent of the concept specialization model, the dual-process model has a stronger pragmatic orientation and discusses how context, plausibility, informativeness, and definingness contribute to comparison processes and the construction of combined meaning. Costello and Keane’s constraint model explicitly proposed three pragmatic constraints that influence conceptual combination – diagnosticity, plausibility and informativeness – and implemented them in a computational simulation.

However, the underlying cognitive mechanisms that might correspond to these constraints are very vague. In computer simulations, for example, Costello and Keane operationalized the informativeness constraint as the appearance of a new predicate that was not contained in the prototype of the head concept but whether similar processes might operate in cognition is unknown.

Constructing the meaning of a conceptual combination involves numerous factors, among which the communicative context is undoubtedly one of the most important. Conceptual combination is largely a problem of communication, where someone intends to communicate a meaningful message to others within a certain context. Pragmatics provides useful tools to help conceptualize this process. However, current models that include pragmatic considerations generally lack detailed explanations of how pragmatic factors function cognitively. For example, Murphy proposed that knowledge serves two functions in the concept specialization model. “First, outside knowledge must often be consulted in order to decide which slot is the appropriate one to specialize... the second reason for consulting outside knowledge is to elaborate or clean up the concept in order to make it more coherent and complete” (Murphy 1988: 533). However, the nature of “outside knowledge” is not clearly defined and is treated as a kind of black box in which the cognitive mechanisms that guide its function are unknown. Similar observations could be made about variables such as context, appropriateness, and relevance in various models. These pragmatic factors have face validity, but the cognitive mechanisms underlying them are in need of more detailed specification.

One reason such cognitive mechanisms may be difficult to specify is an apparent assumption that pragmatic constructs such as context or knowledge require a different representation and treatment than that used for conceptual meaning. Is it possible that we could treat meaning, context, and knowledge in more or less the same way, using a common representational structure, so that whenever we discuss the meaning of a conceptual combination, we naturally include aspects of context and knowledge in the discussion? Ideally, future models of conceptual combination need to consider how pragmatic factors could be integrated with conceptual meaning in a parsimonious fashion.

2.4. Explanatory Scope

The last dimension of our framework compares the theories of conceptual combination based on the explanatory scope of each model, referring specifically to the following four distinctions: novel vs. mundane combinations, true vs. spurious conjunctives, head vs. modifier roles, and noun-noun vs. adjective-noun combinations. With respect to the first of these distinctions, a mundane combination is the one that is commonly used in everyday language, such as *red apple*, while a novel combination is the one that rarely if ever appears in our daily language, such as *elephant fish*. It has been suggested that novel conceptual combinations are a key source of creative thought, thus several of the models focus on the cognitive processes of combining concepts in novel ways (Table 1).

For the second distinction, a true conjunctive refers to a symmetric conceptual combination of two component concepts (X and Y), such that the combined concept (XY or YX) represents something that is a member of both category X and Y, regardless of component sequence. On the other hand, if XY and YX have different meanings, they are

considered to be spurious conjunctives. For example, if pet fish has the same meaning as fish pet it is a true conjunctive. Two models of conceptual combination explicitly focus on true conjunctives. In fuzzy set theory the meaning of a combination is defined symmetrically as set intersection (i.e., $X \cap Y = Y \cap X$). In the composite prototype model a particular syntactic structure of “X that is also Y” is used in experiments to ensure that combinations reflected true conjunctives (e.g., “machines that are also vehicles,” “furniture that is also a household appliance,” etc.). Most of the other theories, however, assume that XY and YX have different meanings and, therefore, focus their attention on spurious combinations.

The third distinction relates to the different roles of head and modifier concepts in contributing to the meaning of a combination. In the current literature, the head noun or head concept (sometimes simply called head) refers to the central word or concept in the combination (usually corresponding to the second word in the combination in English). The modifier refers to the word or concept in the combination that changes some aspect of the head (usually corresponding to the first word in the combination in English). Five of the models explicitly discuss the role of head or modifier (Table 1), but they differ with respect to which concept is believed to contribute most to the combined meaning.

The selective modification, concept specialization, and dual process models propose that the head concept dominates the meaning of the combination, while the CARIN model proposes that the modifier dominates by selecting thematic relations for the combination. The interactive property attribution model proposes that both head and modifier contribute equally to the meaning of the combination.

The fourth distinction is between noun-noun and adjective-noun combinations. It is interesting to note that grammatical terminology is often intermingled with cognitive terminology in the current literature. When we define conceptual combination as a combination of two (or more) concepts, we are discussing the cognitive structure of this combination. However, cognitive structure cannot be explicitly discussed without reference to the grammatical structure of words and their relations. Thus in all of the current models, a combination of two concepts equates to a combination of two words. For example, the two-word combination “elephant fish” refers to a combination of two concepts *elephant* and *fish*. Because of this, researchers frequently use grammatical terms to refer to cognitive combinations. Noun-noun combinations, such as “zebra bird,” refer to combinations of two concepts represented by nouns in the English language. Adjective-noun combinations, such as “red apple,” refer to combinations of one noun concept and one adjective concept that, arguably, expresses a feature of the object denoted by the noun. The latter are sometimes sub-categorized into predicating adjective- noun combinations (e.g., “beautiful story”) in which the combination can be re-written into a semantically correct sentence (“story is beautiful”), and non-predicating adjective- noun combinations (e.g., “atomic engineer”) in which the combination cannot be rewritten into a semantically correct sentence (i.e., the sentence “engineer is atomic” is meaningless). Except the selective modification model, most of the current models are intended to explain noun-noun combinations and only a few are adequate to explain adjective-noun combinations (Table 1). These four distinctions (novel vs. mundane combinations, true vs. spurious conjunctives, head vs. modifier, and noun-noun vs. adjective-noun) are based on current terminology used in the literature to characterize the explanatory scope of the ten models. However, it should be noted that these distinctions themselves raise certain questions or concerns in relation to theorizing the conceptual combination process.

Table 1. The Summary of ten models evaluated against the analytica framework

	Schema		Consistency	Pragmatic orientation	Explanatory scope				
	schematic representation	schema as causal factor	reconciling conflicting expectation	context, intent, plausibility, goal, appropriateness	head - modifier	noun-noun	adjective -noun	mundane vs. novel	true vs. spurious conjunctives
Interactive property attribution	yes	yes	no	somewhat	yes	yes	no	novel	spurious
CARIN	yes	yes	no	no	yes	yes		both	spurious
Coherence	no	no	yes	no	no	yes	yes	both	not explicit
Constraint	yes	no	no	yes	no	yes	no	novel	spurious
Dual process	yes	yes	yes	yes	yes	yes	no	novel	spurious
Composite prototype	yes	no	yes	no	not explicit	yes	no	both	true
Concept specialization	yes	yes	somewhat	somewhat	yes	yes	yes	both	spurious
Amalgam	yes	yes	yes	yes	no	yes	yes	both	both
Selective modification	yes	yes	no	no	Yes	no	yes	both	spurious
Fuzzy set	no	no	no	no	no	yes	yes	mundane	true

First, the assumption of the existence of genuinely conjunctive concepts is questionable. Zadeh (1982) assumes that conjunctive concepts are distinguishable from spurious conjunctions and that fuzzy set intersection is applicable only to genuinely conjunctive concepts.

Psychologically, if we artificially define concepts strictly in terms of categorical denotations, there may be genuine conjunctives representing something that is both in category X and Y. Hampton (1988) used such a strategy in experiments by directly asking subjects to think about conjunctives like “machines that are also vehicles.”

However, whenever we move to the linguistic level and use two words to denote a conceptual combination (e.g., “apartment dog”), it could be argued that the vast majority of empirically observed conceptual combinations, if not all, are really spurious conjunctives, because our intuitive understanding of the meaning of combination XY is usually very different from the meaning of YX. To repeat an earlier quote, “a desk lamp is a kind of lamp, but a lamp desk is a kind of desk” (Murphy 2002: 445).

In the communicative context, syntactic constraints function by which one word subconsciously functions as a logical operator X (i.e., the modifier) while the other word functions as a denotation Y (i.e., the head) such that X transforms Y into the denotation XY. Thus, when conceptual combinations are interpreted within a natural linguistic context and not defined artificially, it seems that there really are no genuine conjunctives and all combinations XY become so-called spurious conjunctives.

Another questionable implicit assumption made by most of the current models is that nouns represent concepts deserving of a rich schematic representation, while other parts-of-speech do not represent concepts and thus do not need to be represented by a similar cognitive structure. The earlier example of *apartment dog* showed that modifiers (e.g., apartment) are also rich concepts but, compared to head concepts, modifiers are treated by most theories in much simpler ways as mere slot fillers.

In general, it is clear that concepts exhibit a greater variety of linguistic manifestations than just nouns, including adjectives, verbs, prepositions, adverbs, etc., which deserve an equally rich representation of their conceptual structure.

If the modifier or non-noun component of a conceptual combination does more than just providing a value for a slot of the head noun concept, what might be the appropriate schematic representation of the modifier concept? How do the two schemata of the head and modifier concepts interact and influence one another in the interpretation of a conceptual combination? Future models of conceptual combination need to address these two questions.

CONCLUSION

Conceptual combination is a fundamental process of human cognition, in which people use two or more concepts to articulate and comprehend complex meanings that a single concept cannot denote. Through conceptual combination we develop new ideas, communicate with one another, learn and expand our knowledge. This paper contributes to the study of conceptual combination by comprehensively and critically reviewing ten major models, which have been proposed over the last thirty years by researchers in cognitive psychology, linguistics, artificial intelligence, and philosophy. We have examined fuzzy set theory, the

selective modification model, amalgam theory, the concept specialization model, the composite prototype model, the dual-process model, the constraint model, the CARIN model, coherence theory, and the interactive property attribution model. We summarized the basic arguments of each model and critically examined their major issues and theoretical limitations. In addition, we proposed an analytical framework to compare and contrast the ten models along four dimensions: (1) the causal role of schemata in the model; (2) the role of cognitive harmony or consistency in the model; (3) the pragmatic orientation in the model; and (4) the explanatory scope of the model. We identified areas of agreement and disagreement among the various models and theories. For example, all models assume a communicative purpose for the combination and a correspondence between linguistic words and psychological concepts. Most also agree that the component concepts (modifier or head) play different roles in the conceptual combination process, and interact with one another to generate a meaning in harmony with a person's background knowledge. Different models disagree substantially on the cognitive mechanisms involved, however, and emphasize different aspects of the process.

Finally, we have offered suggestions for future research directed toward the development of a synthesis model on the cognitive process of conceptual combination. A suitable theory should address the limitations and problematic assumptions of representing conceptual structure using schema theory in online cognitive processing. It should accommodate the requirement of cognitive consistency by specifying both the cognitive mechanisms involved in reducing inconsistency and providing empirical methods for measuring the degree of consistency before and after combination. Pragmatic considerations should be integrated with cognitive considerations, such that background knowledge and aspects of the communicative and linguistic context of conceptual combination can be represented consistently with how concepts are represented. Lastly, a complete theory of conceptual combination must account for the diversity of combinations observed empirically (including both novel and mundane), accommodate the different roles of head and modify concepts in the combination process, reflect the conceptual complexity of the full range of linguistic parts-of-speech beyond just head nouns, and account for the interaction of complex head and modify concepts and their relative contribution to meaning during the combination process.

Chapter 72

WATER NETWORKS, THE CHINESE RADICAL, AND BEYOND

Rong Chen

California State University, San Bernardino, CA, US
Xi'an International Studies University, Xi'an, China

ABSTRACT

In part based on Nie and Chen [2008], this paper studies the complicated semantic networks of WATER. It demonstrates that the concept of WATER has found its way into all major components of the Chinese language: its writing system, its morphology, its semantics, and its syntax. The result is a multidimensional network of networks. The forming of these networks—and the eventual super-network—is due not only to conceptual metaphors/ metonymies but also to other factors such as perceptual considerations and social values. In addition, since meaning is found to exist at the level below the written word, in the radical, the paper raises some important issues regarding the linguistic status of radicals in the language.

Keywords: Conceptual metaphor, metonymy, cognition and culture, embodiment, WATER, Chinese, radical, writing system

1. INTRODUCTION

Studying a set of metaphors and metonymies with the source domain WATER, my colleague and I [Nie and Chen 2008] demonstrate that WATER has been extended to a host of other cognitive domains, and the extensions it has gone through lend much support for the theoretical orientation of experientialism and embodiment.

The current study builds on that earlier work. While Nie and Chen [2008] deal with the phrasal and, occasionally, sentential level of the language, i.e, how WATER is seen in phrases and idioms of Chinese, the focus of this paper is more about the writing system (or

rather, morphology, see below) of the language: how the radicals for WATER show up in a high number of words and how these words are connected through metaphor, metonymy, and other motivational factors such as perceptual considerations. By so doing, I aim to demonstrate the degree to which the study of an intricate and complicated semantic network such as WATER can tell us about how language is influenced and determined by a host of non-linguistic factors.

There is a second aim for the present study: to raise some issues about Chinese morphology. The notion of the radical, when used in the context of the Chinese writing system, refers to part of a written word. If something is an undeniable part of a word, with its identifiable meaning or function, that thing borders on being a morpheme. However, the Chinese radical has not been recognized as such. Instead, the morphemes of Chinese are believed to be the written word, the kind of thing that one finds as a dictionary entry. The reason for this received wisdom is well-founded: While morphology, viewed as one aspect of the architecture of language, has to have psychological reality in the mind of an ordinary speaker, most pertinently one who does not read or write, the meaning and function of a Chinese radical are recognized only by those speakers who do (read and write).

However, the present study will question the neglect of attention hitherto paid to the Chinese radical. It will demonstrate that the Chinese radical plays a far more important role in the language than has been given credit for. I will return to the discussion of this at the end of the paper.

The theoretical orientation of the present study is the theories of conceptual metaphor that originates in Lakoff and Johnson [1980] but refined by many others [Johnson and Lakoff 2002, Grady 1997, Ruiz de Mendoza and Sandra 2005]. I will not attempt a literature review, as conceptual metaphor has been a well-recognized line of research for the audience of this journal.¹ Instead, I will briefly discuss the relationship between metaphor and metonymy² in the following paragraphs.

According to Lakoff and Johnson [1980], mapping in metaphor is cross-domain and mapping in metonymy takes place within one domain. Based on this, Croft [1993] proposes the notion of *domain matrix*, arguing that metaphor maps concepts in two separate domain matrixes while metonymy, within one domain matrix. Radden and Kövecses [1999] invoke Lakoff's [1987] concept of idealized cognitive model (ICM), treating metonymy as "a cognitive process in which one conceptual entity, the vehicle, provides mental access to another conceptual entity, the target, within the same idealized cognitive model" (1999: 21). Blank [1999, cf. Koch 1999], resorts to the notion of *frame* to capture metonymic relations, leaving metaphor to be handled by the classical concept of similarity [Jakobson 1956,

¹A search of the key word, conceptual metaphor, in Chen et al.'s [2007], for instance, turns out thousands of entries, and the kinds of metaphors that have been studied cover a great number of domains, such as body part metaphor [Yu 2000, 2004], time metaphor [Gentner 2002, Evans 2003], spatial metaphor [Chun 2002, Coulson and Matlock 2001], container metaphor [Kövecses 1995], emotion metaphor [Emanation 1995], web and news metaphor [Kennedy 2000], disease metaphor [Gibbs and Franks 2002], thinking metaphor [Palmer 2003, Goddard 2003], hieroglyphic script metaphor [Goldwasser 2005], political metaphor [Mio 1997], environment metaphor [Romaine 1996], immigrant metaphor [O'Brien 2003], and money metaphor [O'Connor 1998], to name just a few.

²It may be interesting to point out that metonymy has been playing the second fiddle to metaphor ever since the Greeks [Dirven 2002]. However, it has experienced a surging attention in the last decades due to its close relationship with metaphor [Dirven and Pörings 2002, Panther and Radden 1999, Barcelona 2000, Ruiz de Mendoza and Sandra 2005, Haser 2005].

reprinted in Dirven and Pörings 2002]. A similar approach is found in Panther and Thornburg [1999], although they use *scenario* instead of *frame*.

Surveying the vast amount of literature on metaphor and metonymy, particularly the interaction between them, one finds that the link between metaphor and metonymy is far more intimate and complex than hitherto assumed. For instance, Taylor [1995] proposes the notion of metonymy-based metaphors—metaphors that come about not via image schemas per Lakoff and Johnson but via metonymic relations—and Goossens [1995] coins the term *metaphonymy* to describe instances of combinations of metaphor and metonymy. Also recognizing the difficulty of teasing metaphor from metonymy is Dascal [2004], who demonstrates in detail how ARGUMENT IS WAR is a case of “double grid”: The source domain and target domain are mapped both metaphorically and metonymically. All these insights are summarized into a continuum view by Dirven [2002]—that metaphor and metonymy are not a dichotomy but are two end-points of a continuum.

In this study, I do not intend to participate in the theoretical discussion on the nature of the interaction between metaphor and metonymy. Instead, I will follow the domain approach, treating metaphor as a cross-domain mapping and metonymy otherwise. This is because, although the domain approach has been heavily criticized, it “remains firm” as a tool to distinguish between metaphor and metonymy [Dirven 2002: 37]. Besides, many of the newer theories—domain matrix, frame, and ICM—can be seen as variations of the domain approach. Hence they seem to face the same sort of challenge as does their domain approach predecessor [Haser 2005]. Besides, I am convinced that most of the tokens in our corpus are clear cases of either one or the other, hence adopting a different approach would not alter the overall results.

2. THE WATER RADICAL

2.1. The Origin of the WATER Radical

The WATER radical has its origin in Oral Bone Inscriptions, the oldest known record of the written Chinese language (1400 to 1100 B. C.). In the shape of , it is a pictorial representation of a flowing river.

Later development of the Chinese writing system gradually transformed the WATER radical into , symbolizing WATER with what is meant to be three drops of water, exclusively used on the left side of a word. Hence the radical is called *sandishui* 三滴水 ‘three drops of water.’ There are also two variations to the *sandishui*. The first is 水, which appears as both a radical (e.g., 入 ‘into water’, in which the radical on the top, 入, means “enter”) and a word, to mean “water.” The second is , a pictorial presentation of two drops of water, hence the name *liangdishui* ‘two drops of water’. Apparently,  and  were exchangeable for some time, with the exact dates unknown, as they appeared in a set of words with no difference in meaning (冲 and 冲). However, the two gradually divided their shared semantics into WATER () and ICE (). In the rest of the paper, I shall not dwell further on the distinctions among these three WATER radicals. Instead, I will treat them as allo-forms of the same notion.

The WATER radical belongs to the type of radical that represents meaning, as opposed to the majority of radicals that represent sound. Hence the word 河 ‘river’ has to its left the radical 氵 ‘water’ and to its right the radical 可, pronounced as [kə], to inform the reader that the word 河 shares the vowel with 可, to be pronounced [hə]. In the following, I will discuss different word classes that the WATER radical is used in the Chinese lexicon, based on the assumption that each appearance of the WATER radical represents the notion of WATER.

2.2. The WATER Radical in Nouns

Of the large number of nouns that contain a WATER radical, the first notable group are words that refer to bodies of water:

(1)

江: <i>jiang</i>	‘(big) river’
河: <i>he</i>	‘(small) river’
湖: <i>hu</i>	‘lake’
海: <i>hai</i>	‘sea’
洋: <i>yang</i>	‘ocean’
溪: <i>xi</i>	‘stream’
池: <i>chi</i>	‘pond’
泉: <i>quan</i>	‘spring’

Just as the words for bodies of water contain the WATER radical, so do proper nouns that refer to specific bodies of water:

(2)

汉江:	<i>hanjiang</i> ,	‘the <i>Han</i> River’
湘江:	<i>xiang jiang</i>	‘the <i>Xiang</i> River’
汨罗江:	<i>miluojiang</i>	‘the <i>Miluo</i> River’
渤海:	<i>bohai</i>	‘the <i>Bo</i> Sea’
淮河:	<i>huaihe</i>	‘the <i>Huai</i> River’
洪湖:	<i>honghu</i>	‘the <i>Hong</i> Lake’

There is hence little doubt that the WATER radical, 氵, does its job of carrying the semantics of WATER into those lexemes.

In (1) and (2), there is a one-to-one relationship between the different kinds of water and the pictorial representation of WATER. This relationship seems to continue into the next group: words that refer to different forms of water:

(3)

波: <i>bo</i>	‘(small) wave’
--------------	----------------

浪: <i>lang</i>	‘wave’
潮: <i>chao</i>	‘tide’
汐: <i>xi</i>	‘ebb’
涟: <i>lian</i>	‘ripple’
瀑: <i>pu</i>	‘waterfall’
滴: <i>di</i>	‘drop of water’
涎: <i>xian</i>	‘mouth water’

In other words, ontology is playing a part here: Speakers see water and use the pictorial representation for WATER in the word referring to it. However, this ontological link becomes more and more tenuous as we go along:

(4)	
液: <i>ye</i>	‘liquid’
汤: <i>tang</i>	‘soup’
酒: <i>jiu</i>	‘alcohol’
泪: <i>lei</i>	‘tears’
涕: <i>ti</i>	‘discharge from the nose’
汞: <i>gong</i>	‘mercury’
泥: <i>ni</i>	‘mud’
洼: <i>wa</i>	‘indentation in the ground’

As the English glosses indicate, none of the tokens in (4) refers to things that are strictly water. They are *watery* at best: The first six, 液 ‘liquid’, 汤 ‘soup’, 酒 ‘alcohol’, 泪 ‘tears’, 涕: ‘discharge from the nose’, and 汞³ ‘mercury’ are watery, as they seem to be construed as water being mixed with other substances: WATER is hence seen as a defining feature for these entities. Since the physical state of these things is liquid, we could say that the notion of LIQUIDITY unifies them, or that the notion of WATER is extended to LIQUIDITY.

The conceptual link between WATER on the one hand and 泥 ‘mud’ and 洼 ‘indentation in the ground’ on the other cannot be said to be LIQUIDITY: Neither is liquid. However, mud contains water and an indentation in the ground catches water (hence it is more likely to hold water than the surface of the ground). Once again, we see that the notion of WATER has been invoked to offer a way of construing.

WATER also plays a part in words for ice and steam:

(5)	
冰: <i>bing</i>	‘ice’
汽: <i>qi</i>	‘steam’

³It is no accident that mercury, the only metal that is liquid under normal temperature, is the only metal being represented in the Chinese orthography with a WATER radical.

For reasons that may no longer seem too stretched: Ice comes from water below the freezing point and steam, at the boiling point.

Lastly, the WATER radical also appears in place names that are near or are surrounded by water:

(6)

洲: *zhou* ‘continent, island’

浒: *hu* ‘marshes’

浦: *pu* ‘place where a river enters a sea’

滨: *bin* ‘coast, by the sea’

港: *gang* ‘harbor’

Obviously, there is no a priori reason for these words to contain the WATER radical. However, the fact that the Chinese language has decided to represent these entities using the WATER radical as its semantic component is evidence that WATER is seen as the defining feature for them.

Even more tenuous is the relationship between WATER on the one hand and the two words in (7) on the other.

(7)

沙: *sha* ‘sand’

涯: *ya* ‘end of the earth’

In other words, one wonders why sand 沙 and the end of the earth 涯 are defined by WATER. The answers seem to be that, for the former, sand is found in oceans, seas, and rivers and, for the latter, the end of the earth is the end of a sea or ocean: One stands by a large body of water and sees no end to it in the same way one does not see the end of the earth. In terms of conceptual metaphor, the relationship between the two *ends* can be said to be motivated by the metaphor THE END OF THE EARTH IS THE END OF OCEAN.

To summarize the discussions in this section, we see that the WATER radical serves as a semantic carrier, bringing with it the characteristics of WATER into a variety of nouns in the Chinese lexicon. While the relationship between WATER and these nouns starts out as ontological—after all, a river, sea, or ocean *is* a body of water in the physical world—it becomes less and less obvious as WATER is extended through metaphor and metonymy to a vaguely discernable feature.

2.3. The WATER Radical in Verbs

While the organization of nouns with the WATER radical seems to be the ontology cline—from more ontological to less ontological—the organization of verbs with the WATER radical centers on semantic roles: the kind of argument that water is cast in in the verbal event. First of these are words that assume the role of theme for water:

(8)

流: <i>liu</i>	‘flow’
汇: <i>hui</i>	‘converge’
涌: <i>yong</i>	‘rush’
淋: <i>lin</i>	‘shower’
漫: <i>man</i>	‘overflow (of a large body of water)’
淹: <i>yan</i>	‘flood’
浸: <i>qin</i>	‘soak’
渗: <i>shen</i>	‘spread (via soaking) gradually and slowly’
凝: <i>ning</i>	‘change into solid (from liquid)’

The prototypical uses of these words in sentences either take or assume water as the subject: Water flows; bodies of water converge; water rushes (down); or water showers on the grass. However, every one of these words has been extended to take other entities as its agent or theme: 车流 ‘the flowing of vehicles’; 人群汇合 ‘(Groups of) people converge’; and 他们涌了进去 ‘They rushed in.’ In fact, a Chinese speaker has no choice but use these words for their respective meanings with any entity as theme or agent. Take 流 again: It is *the* word for the flowing and movement of things in general: 流程 ‘flowchart’, 流通 ‘movement of cash or goods’, 流浪 ‘roaming (by a homeless person)’, 流言 ‘rumor’, 流传 ‘spreading’, 气 流 ‘flowing of air’ 电流 ‘electrical current’, and 流放 ‘exile’.

There are also a large number of verbs that assumes the role of patient for water. In the following, all verbs prototypically take *water* as their patients:

(9)

汲: <i>ji</i>	‘suck’
治: <i>zhi</i>	‘control’
洒: <i>sa</i>	‘spray’
渡: <i>du</i>	‘cross’
涉: <i>she</i>	‘cross (on foot)’
泼: <i>po</i>	‘pour’
添: <i>tian</i>	‘add’
测: <i>ce</i>	‘measure, test’

As is the case with the verbs in (8), those in (9) have also been extended generic usage, taking non-water things as their patients. Take the last two of the group for instance. 添, originally meaning “add water,” now means to add anything one can imagine. 测 is similar: Its original sense of “measuring the depth of water” has been extended metaphorically to refer to the measuring, testing, or assessing everything possible. If one is to posit a metaphor

connecting the original senses of these verbs to their extended senses, it would be along the lines of Vx IS V WATER, whereby x stands for anything that is not water.

WATER also serves as the instrument of a verbal process. Consider (10):

(10)

淘: <i>tao</i>	‘wash (rice)’
沏: <i>qi</i>	‘make (tea)’
洗: <i>xi</i>	‘wash (anything)’
刷: <i>shua</i>	‘brush (teeth)’
漱: <i>shu</i>	‘rinse (mouth)’
灌溉:	<i>guangai</i> ‘water (crops)’

Obviously, without water being an instrument, there would be little in common among this group of verbs. Even in terms of instrument, water is not *the* instrument but *a* instrument for them: The instrument for 淘 ‘wash (rice)’, for instance, can be hands, a bucket, or a bowl. The instrument for 沏 ‘make (tea)’ can be hands, a tea pot, tea leaves, a tray, or tea cups. However, the appearance of the WATER radical, 氵, in these words indicates that it is WATER that helps speakers unify this group of otherwise disparate verbs into a network of concepts.

Water may also be the location for verbal events, as is seen in (11), in which the relationship between WATER and the verbal meaning is quite clear:

(11)

漂浮:	<i>piaofu</i> ‘float’
游泳:	<i>youyong</i> ‘swim’
溺: <i>ni</i>	‘drown’
洄: <i>qiu</i>	‘swim’
淌: <i>tang</i>	‘wade’
沉: <i>chen</i>	‘sink’
没: <i>mo</i>	‘submerge’

and manner, as in (12):

(12)

沥: <i>li</i>	‘(fall) drop by drop’
汨: <i>gu</i>	‘(as) quickly (as the flowing of water)’
沸: <i>fei</i>	‘(emerge, appear) as boiling water’
活: ⁴ <i>huo</i>	‘(moving) like water’

⁴This word is used here in its very original sense. Its meaning of living is the result of metaphorical extension, which I will ignore in this paper.

In other words, speakers project the different manners of water onto the manner of other domains, thus viewing the verbal event in the same way they view water.

2.4. The WATER Radical in Adjectives

While the ontology cline seems to be the basis for nouns containing the WATER radical and the semantic roles of water seem to be the basis for verbs containing the WATER radical, perceptual transfer plays an important part in the appearance of the WATER radical in adjectives.

First are a group of adjectives that describe the different looks of water.

(13)

清淨: *qingjing* ‘clean’

污浊: *wuzhuo* ‘dirty’

浑沌: *huntun* ‘unclear, (a) shapeless (mass)’

洩: *you* ‘slow’

渺: *miao* ‘endless’

深: *shen* ‘deep’

浅: *qian* ‘shallow’

满: *man* ‘full’

Just as is the case with the words discussed earlier, the looks of water are extended to the looks and appearances of other things. Take the last three adjectives for example. 深 ‘deep’ and 浅 ‘shallow’ are used to describe, respectively, the depth and shallowness of anything possible, including concrete things like holes, wells, and tunnels and abstract things such as knowledge, personality, and thought. Similarly, anything full is said to be 满 ‘full’. In fact, it has to be said to be 满. The metaphorical extension appears to be mandatory, leaving the speakers of the language no other alternatives.

The adjectives for *thick* and *thin* in Chinese also contain the WATER radical: 浓 *nong* and 淡 *dan*, respectively. However, their etymological origins were not based on the looks of water, but on the looks of fog.

This is hardly surprising by now: Fog is formed with particles of water, therefore its looks are seen as looks of water.

Next come the adjectives that describe the sounds made by water:

(14)

潺: *chan* ‘(sound) like water flowing leisurely’

汹: *xiong* ‘(sound) like water flowing rapidly’

The textile sense is also invoked:

(15)

滑: *hua* 'slippery'
 温: *wen* 'lukewarm'
 湿: *shi* 'wet'
 冷: *leng* 'cold'

These adjectives seem to have been evolved from the sensation produced by the touching of water or watery things. 滑 'slippery' describes the sensation of touching (or stepping on) wet rocks, 温 'lukewarm' the sensation of feeling lukewarm water, 湿 'wet' the sensation of touching wet objects, and 冷, the sensation from the touch of cold water. Once again, these original meanings have been extended to non-water things. Take 滑 'slippery' again. It is a word that refers to the attribute of slipperiness of everything.

How about the sense of taste? My search has turned out only one word that etymologically describes the taste of water: 涇 *ce* 'dry, lack of water in taste'.

Finally, I have found no adjectives with the WATER radical that describe the smell of water or watery things. This absence, if it turns out to be true based on more extensive research, is also interesting. It may have to do with the Chinese folk definition of water: "A colorless and smell-less liquid."

To sum, this section, on the appearance of the WATER radical in the Chinese adjective lexicon, reveals yet another organizing principle based on WATER, that of senses. While it is different from the WATER radical containing nouns, which are based on an ontological cline, and WATER radical containing verbs, which are centered on the different semantic roles that water is supposed to play in the verbal event, it offers support for the notion of the embodiment of language, albeit in a different light. Since the sensory motors are the primary means for human beings to know and to make sense of the world around them, it is only natural for Chinese speakers to create part of their adjectives based on the sensation gained through the senses and then extended their semantics to other, non-water things.

2.5. 没 *Mo* to 没 *Mei*: A Case of Grammaticalization

In this section, I discuss the negation marker, 没 *mei*, demonstrating how it has been grammaticalized from the meaning of "being submerged in water."

The written word, 没, pronounced [mo], originally referred to (and it still does in Modern Chinese as one of its senses) to the concrete event of something being immersed in water, often used with 淹 *yan* 'flood, cover' to form 淹没 '(water) make (something) disappear (by the act of covering it)'. This sense was then extended to mean disappearance. To answer the question "Where is X?", one can simply say "没了 *meile*," to mean X has disappeared (being lost, consumed, or used up). This extension was accompanied with a change of pronunciation in some dialects such as Mandarin. In those dialects, a distinction exists between [mo] and [mei], with the former to mean "submerged" and the latter to mean "disappeared." In other

dialects such as the Shaanxi dialect, however, such a change did not take place: The written word 没 has retained its pronunciation of [mo] even if it refers to disappearance. So, the transfer from the semantics of being submerged to the meaning of disappearance constitutes the first step on the path of grammaticalization, and this step seems to be enabled by the metaphor DISAPPEARING IS BEING IMMERGED IN WATER.

Once meaning disappearing, 没 became able to refer to absence or non-existence, for if something has disappeared, it no longer exists (NON-EXISTENCE IS DISAPPEARANCE). This could be the reason for 没 to be grammaticalized into the negation marker in existential constructions:

(16)

我	没	有	书
<i>Wo</i>	<i>mei</i>	<i>you</i>	<i>chu</i>
I	not	have	book

‘I don’t have books.’

There is the final step: The notion of NON-EXISTENCE is extended to NEGATION in both the past tense construction:

(17)

他	昨天	没	来
<i>Ta</i>	<i>zuotian</i>	<i>mei</i>	<i>lai</i>
he	yesterday	not	come

‘He did not come yesterday.’

and the present perfect construction:

(18)

他	还	没	来
<i>ta</i>	<i>hai</i>	<i>mei</i>	<i>lai</i>
he	still	not	come

‘He still hasn’t come.’

As the negation lexeme for the existential construction, the past tense construction, as well as the present perfect construction, 没 is one of those few lexemes that help form the main machinery of the language. However, this important development of the language was possible in part due to the speakers’ conceptualization of WATER.

2.6. Summary of Section 2

I have aimed, in Section 2, to demonstrate how the WATER radical functions to organize the lexicon in Chinese. When used in nouns, the words with the WATER radical seem to start out on an ontological basis: The radical appeared in nouns whose referents are observably

water or having clear characteristics of water. Through metaphorical and metonymic extension, the referents of these words have gradually less and less water characteristics. One can say that nouns with the WATER radical form a network of reference on the ontological cline.

Verbs with the WATER radical, on the other hand, centers on semantic roles. These verbs assume different kinds of arguments for water: water as theme, water as patient, water as instrument, water as location, and water as manner.

Thus semantic roles function to organize all these verbs into yet another network, this time of process.

Furthermore, the WATER radical groups adjectives into categories based on human perception. There are adjectives that describe the characteristics of water which come to the speaker through the sense of sight; there are adjectives that are essentially onomatopoeic, representing the sounds of water; there are adjectives that describe the sensation resulting from the speakers' textile sense; and there is at least one adjective that describes the taste of (the lack of) water. The absence of adjectives involving the sense of smell is seen as a consequence of the folk definition of water in the language, that water is a "colorless and smell-less liquid." These adjectives form yet another network—a network of senses.

Lastly, I briefly touched upon the process of grammaticalization of the negation lexeme in the existential construction, the past tense construction, and the present perfect construction.

Put all these discussions together, it may not be too far-fetched to view the WATER radical as a means to organize different word classes into networks based on different principles and then to organize these different networks into a whole. After all, a literate Chinese speaker will know that the presence of the WATER radical in a word generally indicates some waterness in the concept encoded in that word, although the relationship may not always be obvious.

At various places, I demonstrated that a particular word with the WATER radical will go through further extension. In Section 2.4, for instance, I argued that the word 满 'full' was originally used to describe the fullness of water but has then been extended to refer to the fullness of anything. The extension does not stop there, though. 满 is also combined with another word or morpheme to form a large number of words or phrases such as 自满 "self full→self-important" and 满意 'happy, satisfied'. If one traces every word on the lists so far discussed, let alone the great many that have not been covered, one would discover more networks.

I shall not do so but will now use Nie and Chen (2008) to illustrate the same point: How WATER function at the phrasal level of the language to form more networks.

3. WATER NETWORKS IN PHRASES

In Nie and Chen [2008], we argue that six WATER super metaphors form a complicated semantic network with WATER at the center. These six metaphors are NATURE IS

WATER, LIFE SUSTAINER IS WATER, MOVEMENT IS WATER, POWER IS WATER, PURITY IS WATER, and WOMAN IS WATER. I go through these metaphors in turn.

3.1. Nature Is Water

To speakers of Chinese, water is the most important element of nature. The well known idiom—one of the first things that a school pupil hears in her geography class—for instance, states: “三山六水一分田” ‘three mountain six water one portion land’, meaning 30% of nature—the earth’s surface, to be more exact—is mountains; 60% of it is water, and 10% of it is cultivatable land. As a result, the concept of WATER has been metonymically extended to the concept of NATURE, as can be attested by the existence of a large number of idioms, proverbs, and phrases in the Chinese language. The most common type is one in which the words 山 ‘mountain’ and 水 ‘water’ coexist to refer to nature. The phrase 山山水水 ‘mountain mountain water water’, for instance, means simply “nature.” More specifically, MOUNTAIN and WATER are used to stand for scenery, as the following tokens suggest:

(19)

绿	水	青	山
clear	water	green	mountain

‘beautiful scenery’

(20)

山	青	水	秀
mountain	green	water	limpid

‘picturesque scenery’

Although they seem to be about the sight of mountains and water, (19) and (20) are everyday phrases used to describe scenery in general—any beautiful scenery, either with or without a mountain or a body of water in it.

Just as MOUNTAIN and WATER, two major parts of nature, are used to stand for nature and scenery, specific mountains and rivers can stand for a specific place or locale:

(21)

巴	山	蜀	水
Ba	mountain	shu	river

‘natural environment in Sichuan’

The mountain 巴山 and river 蜀水 are located in Sichuan Province. When one uses (21) however, one is not speaking about the mountain or the river literally mentioned, but the geographical area of the province in which the mountain and the river are located. Similarly, 白山黑水 ‘bai mountain hei water’ is the metonymy for Heilongjiang province and 三湘四水 ‘three Xiang four water’, for Hunan Province.

Further, consider (22) and (23):

(22)

穷	山	恶	水
poor	mountain	evil	water

‘unfavorable natural surroundings’

(23)

残	山	剩	水
incomplete	mountain	remaining	water

‘damaged nature/environment (by a war or natural disaster)’

Token (22) can mean an environment unfit for agriculture, with barren land, strong winds, or without sufficient rainfall to sustain crop growth, or an environment unfit for any other life-sustaining activities. Token (23) may refer to a general devastation of a place by a war or a disaster—not only the physical aspect of it, but other aspects such as the life conditions of its people, even their psyche. This further extension of meaning is also seen in the kind of adjectives that are used to modify the nouns 山 ‘mountain’ and 水 ‘water’: words such as 穷 ‘poor’, 恶 ‘evil’ (22) 残 ‘incomplete’, and 剩 ‘leftover’ (23) are mostly modifiers of non-physical and often abstract entities, as the English glosses suggest.

If water and mountain are the two things standing for nature in general in the Chinese mind, *water* and *fire* combined—水火—stands for an environment of adversity, as illustrated in (24) and (25).

(24)

水	深	火	热
water	deep	fire	hot

‘an abyss of suffering’

(25)

水	火	之中
water	fire	within

‘in extreme misery’

The target domains of these two tokens are not physical or natural, but abstract and man-made: The suffering and the misery in these phrases often refer to the general conditions of life of the masses as a result of exploitation or other forms of cruelty by the ruling class. But the experiential basis for the mapping is clear: Water, a significant part of nature, can cause hardship as well as pleasure; it can sustain life as well as destroy it.

The foregoing discussion suggests that the extension of WATER to NATURE is primarily metonymy-based. The WATER FOR NATURE metonymy then gradually becomes less metonymical and more metaphorical along the metonymy/metaphor continuum.

3.2. Life Sustainer Is Water

If water is considered the most important part, and hence a symbol, of nature, as I demonstrated in the previous section, it makes sense for Chinese speakers to treat water as a life sustainer. Like the extension of WATER to NATURE, the WATER to LIFE SUSTAINER mapping is done both metonymically and metaphorically. I start with cases of metonymies. In (26), MOUNTAIN and WATER stand for the food grown and produced in them, respectively:

(26)
 靠 山 吃 山 靠 水 吃 水
 Near mountain eat mountain. near water eat water
 ‘Those living in a mountain live off the mountain; those living near water live off water.’

The relevant metonymy is PLACE (IN WHICH THINGS ARE PRODUCED) STANDS FOR THINGS.

Water is not only a source for food that sustains life; it is itself an essential life sustainer, hence the metonymy WATER STANDS FOR ESSENTIAL LIFE SUSTAINER. For instance, beans, 菽, are the primary grain in Northern China, which explains why, in (27), the combination of 菽 and 水 stands for a life of bare necessities:

(27)
 啜 菽 饮 水
 eat beans drink water
 ‘live on bare necessities’

Similarly, 菽水 in (28) describes a state of poverty, as a life on beans and water alone is a life of no luxury:

(28)
 菽 水 承 欢
 beans water carry pleasure
 ‘poor but filial’

What about Southern China, where the primary food is rice instead of beans? Predictably, 水 ‘water’ and 米 ‘rice’ combined refer to what the combination of 水 and 菽 does for Chinese speakers in the north.

Token (29), for instance, implies that if one has not touched water or rice, one has not eaten anything:

(29)
 水 米 没 粘 牙
 water rice not touch teeth
 ‘having eaten nothing at all’

As is the case with the WATER to NATURE extension, the WATER to LIFE SUSTAINNER extension itself goes through a metonymy-to-metaphor process. Consider (30):

(30)
 斗 升 之 水
 gallon pint of water
 ‘insignificant financial resources’
